In the interval between his engagements as government engineer he made reports and affidavits for various claimants, whose mines he had examined while in the Government's employ, in order to assist them in collecting from the Government. But I find no valid reason for criticizing him for this. The reasons why his attitude might be considered by some as having become slightly unjudicial were:

(a) He made these reports, letters, and affidavits for the claimants for a monetary consideration, as I was advised by the Commission when in San Francisco.

(b) In his letter written for the Payne company to exhibit he overstated the facts. He stated that he gave claimant certain sweeping Government guarantees on June 7, 1918. When his authority for this was challenged he cited, first a letter written by me to another party on September 30, 1918, second a clipping from

the San Francisco 'Examiner' of October 1, 1918, and third a telegram from myself to Mr. Burch dated August 8 or 9, 1918. In my reply to Mr. Toll I summed up as follows:

"All of this would seem to indicate to me that you derived your impression from the above letter and telegram, but at a subsequent time from that which you assign in your letter of July 23 to me and refer to in your letter of March 12, 1919, to the L. R. Payne Co., and that accordingly your letter to the L. R. Payne Co. was an error of recollection. This would indicate a zeal in supporting the claimant which is hardly judicial."

It was felt that, to be above criticism, any question as to the judicial attitude of any examiner should be settled by relieving him of further responsibilities. Examiners must be prejudiced neither for nor against claimants. All appointments are temporary as is (let us hope) the character of our work. No onus was involved, and it is too bad that Mr. Toll decided to rush into publicity and that you were hasty enough to take it up. Several other members have had their terms of employment terminated, but so far have not appealed to the President to be put on the payroll again.

Having given you a deal of information, I should like to have some myself:

1. What is your motive in rushing into a personal attack, without trying or apparently wanting to ascertain the facts? Many months ago, touched by your editorial efforts to comment intelligently on what was going on in Washington, I wrote you, offering to write or telegraph information whenever you wished it. You have never called for any.

2. This is a psychological problem. Why is it that an editor who hates the daily yellow press as laudably as you do, should himself tend so strongly in the direction of technical yellow journalism?

I shall be glad if you will publish this letter in full.

Washington, August 20.

J. E. SPURR.

[We refer to this letter on another page.—EDITOR.]

The Editor:

Sir—I have just read with a great deal of interest your article on this subject appearing in the issue of August 16.

In reference to Mr. Spurr's action in recalling Mr. Toll from his service as engineer for the Commission there is every reason to believe that Mr. Spurr has shown his hand to be out against a fair and impartial administration of the Minerals Relief Act.

I wish to support the evidence offered in your article, and state that on October 14, 1918, I personally interviewed George Otis Smith, Director of the U. S. Geological Survey, J. S. Diller, Chief Geologist, C. K. Leith of the Shipping Board, and Hugh W. Sanford, of the Ferro-Alloys Section of the War Industries Board. On this date these gentlemen gave me assurance of immediate Government action being taken for the protection of the domestic chrome producer by providing a market for chrome ore at fair prices and approximately the same

as prevailed during the summer (1918). Mr. Sanford went further and stated that he had already asked the consumers to purchase 5000 tons of chrome ore, which was temporarily to relieve the situation pending definite Government action for protection of domestic production. I left Washington that evening en route west fully convinced that all chrome ore produced domestically of 40% chromic oxide content, or over, could be readily marketed during the balance of the year and during the first half of 1919. What developed later is well known.

I was present at Medford, Oregon, when many of the claimants were questioned by the Commission. In the light of the opinion of Attorney-General Palmer in respect to the words 'request' and 'demand' as embodied in the War Minerals Relief Act, at least 50% of the claimants for reimbursement on chrome activities will be eliminated from consideration by the Commission. This interpretation, even to the casual reader, must appear absurd. The idea that because a claimant received no "specific" request or demand from one of the five Boards or Departments of the Government, but did receive a general request, would be cause for not being considered worthy of reimbursement under this Act, brings us to wonder if we live in the United States or Mexico. Mr. Palmer, according to his opinion, evidently considers all bulletins and circulars issued by these five Boards or Departments non-consequential so far as being worthy of notice to the extent of conforming thereto, inasmuch as if a demand is printed in a circular form and the same demand embodied in a letter, one carries responsibility under this Act and the other does not. These mental gymnastics are not understood by the Western miner but come as a surprise, and such practices are not creditable to any Administration.

The Commission showed a desire to treat fairly with all claimants except for asking numerous questions that could have no bearing on the merits or demerits of the claims, but sort of embarrassed some claimants by the personal attacks on patriotic and judicial lines in the opinion of the claimant. But if the Commissioners are to be limited in making awards to such narrow confines as the interpretations expressed by Mr. Palmer in his written opinion to Secretary Lane, the claimants in general will fare slim.

We wonder if Mr. Palmer, like Henry Ford, had someone do this for him.

GEO. S. BARTON.

Grants Pass, Oregon, August 18.

The Crowe Process

The Editor:

Sir—I have read with interest the letter by N. S. Keith in your issue of August 23 and your editorial comment thereon. It is true that it has long been recognized, at least on *a priori* grounds, that the less opportunity for absorption of atmospheric oxygen afforded to a solution during precipitation the better it would be for the success of that operation, and in addition to the instance quoted

by Dr. Keith of Swinburne's comment during the discussion in London in 1895, it may be noted that attention was directed to the same point in the original patent specification of the Merrill zinc-dust precipitation. In spite, however, of this common recognition of the general principle involved it does not seem to have occurred to any one of us to make a practical application of it until Mr. Crowe led the way.

It is interesting to note that in connection with the recently devised method for determination of oxygen in working cyanide solutions developed by H. A. White and described in the Journal of the Chemical, Mining and Metallurgical Society of South Africa for April 1918, attention has been called to the oxygen content of the solution in different compartments of the zinc-boxes and in various parts of the plant, and that during the discussion of the data obtained by this method of determination suggestions were offered as to the feasibility of forcibly abstracting the dissolved air from the solutions before precipitation. This discussion took place, or was at least well advanced, before those taking part in it were aware that a patent for doing that very thing had already been obtained by Mr. Crowe.

Dr. Keith suggests that the Crowe process has been (1) anticipated, and (2) consciously anticipated, in the various forms of vacuum filtration that have been in use during the last ten or fifteen years. But I think it probable that neither of these assumptions is correct.

1. It is questionable whether any appreciable amount of dissolved oxygen is removed by subjecting solution in bulk with a small surficial area to the influence of reduced pressure, at least during the few minutes occupied in its passage from the filter-medium to the storage-tank. But, even assuming that sufficient de-aeration takes place in the receiver of a vacuum-slime filter to have an appreciable effect on precipitation, this result would in practice be nullified by the fact that such solution instead of passing directly to precipitation through an air-tight pipeline goes to a storage-sump and from there usually to a clarifying filter before reaching the precipitation system. Now, the researches on the Rand already mentioned go to show that the re-absorption of oxygen by a de-aerated solution is so rapid that while a sample from the last zinc-compartment contained practically no dissolved oxygen, yet one taken from the barren sump showed an oxygen content approaching the saturation point. It would thus seem that no amount of de-aeration during vacuum filtration (assuming such to take place) would have any effect on precipitation.

2. In support of the thesis that de-aeration during vacuum filtration was consciously practised with a view to its effect on precipitation before the date of the Crowe patent, Dr. Keith relies on various quotations from technical writers. In the absence of direct information from the authors of those papers as to the thought present in their minds at the time of writing and the meaning they themselves attach to the quotations given, I think a fair interpretation would limit it to the air-bubbles mechanically entrained in the solution as it flows from the filter-leaves to the receiver, since anyone who has worked with

vacuum-filters knows that during a large part of the cycle the effluent from the leaves is rather in the nature of an emulsion of air and water, on account of leakages in the attachments of the filter-medium to its support and on account of the fact that, at least in filters operating on the cycle principle, the cake is wholly or partly exposed to the air at certain periods. In the case of the Oliver filter also, the leakage of compressed air from the blowing-segment to the vacuum-segments causes a considerable quantity of air to pass continually into the vacuum-receiver with the solution. This interpretation is corroborated by the use of the phrase "entrained air" in the quotation given from the paper by Charles A. Chase and by the fact that in no case does any of the writers give a hint that he supposed he was extracting dissolved oxygen from his solution. The use of a dry-vacuum pump to take care of the entrained air while the solution is removed from the drum by means of a gravity-drain or a wet-vacuum pump was the original method used on the first Butters filter ever constructed, but I know from personal association with the development of that filter that the idea of removal of dissolved oxygen from the solution by such an arrangement never entered the head of any one concerned.

Dr. Keith's quotations from Julian and Smart do not appear to me to have any bearing on the question. The first, that on page 35, merely describes a method of aerating a laboratory charge of sand prior to the application of the cyanide solution, and the apparatus illustrated is for measuring the cubic feet of air so drawn through the charge. The second reference (pages 56 and 57) applies to the well-known use of a vacuum beneath a charge of sand to hasten percolation or to remove surplus moisture, and comes under the same classification as the vacuum-slime filters with their incidental separation of entrained or emulsified air from the solution, as already explained, although I find no mention of such separation in the pages quoted, the only reference being to the removal of films of air around particles of sand in order to allow the solution to come in contact with them.

It seems to me therefore that Dr. Keith has not produced a single instance of the practical application of a vacuum that either resulted in or was designed to result in a removal of dissolved oxygen from cyanide solution as a preliminary to precipitation. E. M. HAMILTON.

San Francisco, August 25.

THE IRON ORE mined in the United States in 1918, exclusive of that containing 5% or more of manganese, amounted to 69,658,278 gross tons, compared with 75,288,851 tons in 1917, a decrease of 7.5%. The quantity of ore shipped from the mines in 1918 was 72,021,202 gross tons, valued at \$244,368,147, compared with 75,573,207 tons, valued at \$238,260,444, in 1917, a decrease in quantity of 4.7%, but an increase in value of 2.6%. The average selling value of the ore per gross ton at the mines for the whole United States in 1918 was \$3.39, compared with \$3.17 in 1917. The stocks of iron ore at the mines, mainly in Michigan and Minnesota, amounted at the close of 1918 to 8,471,507 gross tons.

Ore-Buying in Chile

By C. A. GRABILL

Visitors to the West Coast of South America and especially to Chile are frequently puzzled by the constant reference to "Jackson base" or "Jackson price" in all dealings covering the sale of copper ores and products.

On account of its age, one may almost say antiquity, and its isolation, the copper industry in Chile has developed along lines radically different from those of our own country and one of the peculiar developments is the method of purchase and sale of copper-bearing materials. This is interesting to those engaged in the business, primarily from the fact of its importance in the industry today and secondarily on account of its influence, which has been good in some ways and bad in others, on the mining industry.

Except the production of the Chile and Braden copper companies, most of the ores of the country are sold on the basis of the Jackson price. This price is issued bi-weekly by the firm of Jackson Hermanos at Valparaiso and is quoted for three products, bar copper equivalent to London standard, copper matte containing 50% copper, and copper ore containing 10% copper, together with a factor or scale covering variations from the base assay. At the same time they publish the official quotations for London standard, three months, the exchange rate between *moneda corriente* of Chile and English pence, and also the freight from Valparaiso to England. The price is quoted per 100 kilogrammes (one metric quintal), and no account is taken of the composition of the ore other than its copper contents, nor of the gold and silver contained therein; and there is no deduction for treatment, this being taken care of in fixing the price.

At first sight this seems to the average American, accustomed to the elaborate analytical methods of our own smelters, as a rather careless arrangement and not at all satisfactory; it is assumed that the almost universal acceptance of the system must be due to ignorance among a people unfamiliar with the business. A little more knowledge soon dissipates any such idea. Chile was a copper-producing country even before the coming of the Spaniards or the landing of the Pilgrims, and has been a pretty constant producer ever since. Copper ore was mined and smelted and the product shipped for the manufacture of cannon some three hundred years ago, so it may be fairly assumed that the people know what they are about and that the general acceptance of any system is probably due to some inherent advantage or especial adaptation to conditions that make it superior to others.

As a matter of fact, the Jackson price is especially adapted to the conditions that have prevailed, and it has several advantages. The majority of the copper deposits

so far worked consist of small and narrow veins of little depth, but numerous and widely scattered. There are therefore a large number of prospectors, small miners, and lessees who make a living producing from a few hundred pounds to a hundred tons per month. The individual amounts are extremely small, but the totals run into figures that are quite important in the copper production of the country. The custom is that the ore-buying agencies and smelters scattered throughout the country put up a notice on the issue of the Jackson price that they are paying the price for ores delivered to them with such and such discount depending on the locality and the local conditions. The small producer is thus assured of a steady market for his product from a sackful up, the price varying only with the copper contents and the exchange. This last factor until the War has not been of serious importance owing to the fact that the prices of supplies varied with the exchange exactly the same way as did the price of the ore, and so while it seriously affected those industries in which the labor item was a large factor it did little harm to the man who sold directly the product of his own labor.

Two other factors of importance are that as the grade of the ore decreases, so does the proportion of the intrinsic value of the ore recoverable by the buyer, and consequently his profits; and as the price of copper in London decreases, so does the buyer's profit. This makes a kind of flywheel of the buyer, it being understood that the term 'buyer' includes the smelter, who thus carries the small shipper through the periods of low copper and hard times, presumably making proportionately higher profits when copper is high and times good. A fourth factor of importance is that the price is so regulated that it protects the smelter from loss caused by high freights and exorbitant charges for fuel.

In order to see how this is brought about it is necessary to examine the method by which this price is obtained. It is based on the honesty and good faith of Jackson Hermanos, who, as previously stated, issue it every two weeks; and its almost universal acceptance speaks highly for their reputation. They never have published the formula by which it is arrived at, so most copper men on the West Coast have in their notebooks "the exact method for calculating the Jackson price which was given to me by a man who knew all about it." As a matter of fact, these all differ among themselves, and the true formula has itself varied from time to time, even the quantities used being subject to a certain latitude of judgment.

One formula, which is not correct yet will give prices very close to the published ones under widely varying

conditions, and which bears a fair resemblance to the true one, is as follows:

Let x = Jackson price for bar copper

a = Price of London standard, three months, in pounds sterling

b = Cost of refining standard copper

c = Commission and insurance, per cent

d = Freight from Valparaiso to England

e = Cost of one ton of coke, Chile ports

f = Exchange, that is, value of one peso *moneda corriente* in pence

1.0156 = the ratio between a long ton and a metric ton.

London standard is always quoted, of course, in sterling per long ton and the Jackson price is in *moneda corriente* per metric quintal of 100 kilogrammes. In this connection it should be noticed that Chile is cursed with a double currency; a nominal gold currency one peso of which is nominally worth 18 pence, but which in the fall of 1917, owing to war conditions, was being quoted around 23 pence, and an unsecured paper currency having the same nominal value, but fluctuating widely and at present quoted around $14\frac{1}{2}$ pence. In accordance with the economic law governing such matters the gold currency has practically disappeared in the ordinary commercial transactions, although frequent reference is made to it.

Using the above signs the formula is

$$x = \frac{0.1}{1.0156} (a - b - d - e) \frac{(100 - c)}{100} \frac{(240)}{f}$$

*This gives the price of one quintal of bar copper. The price of one quintal of 50% copper matte is found by deducting 18 shillings, or its equivalent, and dividing by two. The price of one quintal of 10% copper ore is found by taking 53% of the price of bar copper and dividing by 10, it being considered that 47% of the intrinsic, or net, value of the copper in 10% ore, after deducting shipping and refining costs, is the proper proportion due the smelter for operating expense and profit.

The factor or scale (*escala*) for the variation in assay of the ore is obtained by taking one-tenth the price (base) and adding 10 centavos (for ore, not matte).

To make the matter clearer we will take two concrete examples, one using the figures for 1910, four years before the War, and the other those of August 1917.

The average price of London standard copper, three months, for 1910 was £57.19.1 and the average value of one peso, Chile paper, was 10 57/64 pence, refining £1 10s., freight from Valparaiso to England 18s., one ton of coke cost 35s. and interest, commission, and insurance $1\frac{1}{2}$ %. Substituting these values in the above formula and solving we obtain \$115.00 m/c (*moneda corriente*) as the value of one quintal of bar copper compared with the average published Jackson quotation of \$115.77. Then 5.3% of this gives us \$6.14 m/c as the value of one

quintal of 10% ore and $1/10$ of that plus 10 centavos is 71.4 centavos, according to the scale, that is, a 9% ore would be worth \$5.426 and an 11% ore \$6.854 m/c.

These prices are supposed to be on board ship, and a deduction of 25 centavos per quintal is made for Jackson on land (*a tierra*), the loading expense being assumed at \$2.50 per ton m/c.

In August 1917 the price of London standard was £119 10s., freight was 200s. instead of 18, and coke was 160s. instead of 35. Exchange was $13\frac{1}{4}$. Substituting these figures, we find that the price of 10% ore was \$9.12 $\frac{1}{4}$ and the scale \$1.01 $\frac{1}{4}$; thus we see that, although the price of copper in the world's markets had more than doubled, the Jackson price had not increased 50%, the difference being due to the difference in exchange and freight and fuel.

It is, of course, clear that this price is not fixed by any law of nature or State; it is entirely dependent on the good faith and judgment of the firm issuing it; nevertheless it is generally used in Chile by all ore-buyers and smelters either as published or with slight modifications in the base or scale as required by local conditions. In recent years it has unquestionably had great influence on the development of the mining and smelting industries.

Referring to the formula, and omitting consideration of the prices for bar copper and matte, we find that after deducting the direct charges for refining and marketing the remainder of the value of a 10% ore was divided between the miner and smelter in the ratio of 53:47, both parties paying their operating expense and obtaining their profit from their respective proportions. The smelter is partly protected from excessive freight-rates and fuel-costs by the arbitrary deduction of the price of one ton of coke before the division. The price also varies inversely as the exchange-rate; and this is quite proper, for if the paper money loses half its value the seller receives twice as much of it; and as its purchasing power has also dropped, the miner is in the same position as before. It should be noted that it is the exchange on London that governs.

If copper rises in price at London the miner receives only 53% of such increase in value, but, conversely, if it drops the buyer has to carry 47% of the drop and his profits begin to disappear accordingly. The idea underlying this was undoubtedly that the smelter and the miner would both cease to make profits at the same time and to hold the price as steady for the miner as possible, the smelters making their profits in prosperous times and on high-grade ores. The latter result was assured by the scale. If it is assumed that a 10% ore represents average conditions as to cost and profit, then the profit on a 15% ore must be considerably greater, as the smelter still receives a large proportion of the increased value without greatly increased expense. On the other hand, on the lower-grade ores his profit falls off very rapidly, as he still receives only 47% of the value and his expenses have increased rather than decreased. This is somewhat but inadequately compensated by the increase of 10 centavos in the scale, and so the buyer protects himself

*A, b, d, and e should be stated in pounds and decimals thereof or, as an alternative, they may be stated in pence and the constant 240 struck out.

by making a flat ruling that he will purchase no ores containing less than a fixed minimum, say, 6% copper.

The result has been satisfactory to the small shipper and prospector, as they know that any ore above this limit will bring a certain definite amount; therefore the prospector goes out into the hills, finds a small stringer from which he can gouge out a few hundred pounds of ore, does so, takes it to the nearest ore-buyer and sells it on a cyanide assay of a grab-sample without regard to the content in silica, iron, or lime, or even gold or silver, unless there is a great deal of it, and so there has been an enormous amount of prospecting for high-grade surface deposits. The expense of handling these small amounts must necessarily be borne by the average price and there is little incentive to sorting and concentrating other than that caused by freight charges. Inasmuch as the ores are mainly silicious, expenses high, and fluxes scarce or unobtainable, I am inclined to think that this method of ore-buying is partly responsible for the large number of abandoned smelters throughout the country.

To take a specific example. Assume a mining district in the interior with high freight-rates to market. 'A' is the owner of a typical deposit. He can produce monthly a few hundred tons of silicious ore of about 7% copper, but on account of the cost of shipping he is compelled to sort it up to 10%, which gives a neutral product suitable for smelting. He has a low-grade dump, naturally very silicious and containing only 3% copper. 'B' looks over the district as a possible smelter-site. He finds that there is not enough 10% ore to warrant a smelter, but there is considerable 7% ore not being shipped as it will not pay. However, 7% ore will pay expenses and keep the smelter running, and the profit on the 10% ore will make a good return on the investment. He offers to pay the Jackson price, and makes the lower limit $6\frac{1}{2}\%$, because it will pay operating charges and carry a little of the overhead expense. Fluxes are scarce and expensive, but little are required, because the 10% ore, which constitutes the bulk of the production, is a neutral ore. He commences operations. 'A' immediately sees that 3% ore on the Jackson price is worth \$2.30 per quintal and the cost of delivery to the smelter close-by is only \$2 per ton, or 20c. per quintal. Of course, it is below the minimum, so he mixes one ton of 10% with one ton of 3%, obtaining two tons of $6\frac{1}{2}\%$, which he ships. 'B' no longer has any 10% on which to make profits and has the choice of raising his minimum or cutting his price. Whichever he does it cuts down his tonnage, and compels him to smelt a certain amount of low-grade silicious material at an excessive cost, which must be borne by the better material; nor is there any satisfactory method of avoiding it except by a tariff based on the composition of the ore.

If, in the case referred to, a penalty be applied to the silica contents it might prove possible for 'A' to so sort his ore as to make a basic product worth more to the smelter than the combined materials he is shipping and the smelter would be enabled to lower its minimum to 5% or less and still make money.

Another objection to the Jackson price is its failure to take any consideration of the gold and silver. Chile has been a great producer of these metals, but at the present time there is not any adequate encouragement to the prospector to look for copper ores containing gold and silver or for silver ores suitable for smelting. It is quite possible to formulate a method of payment that will cover these points, but it is then no longer the Jackson price.

This condition of affairs is being recognized and smelters are introducing silica penalties, premiums for iron and sulphur, etc., but the result is still only a compromise. Ultimately the country will come to our own methods, paying for the metals at their recoverable value, with a treatment charge in accordance with the analysis and proportionate to the work done. This will result in cheaper smelting, a better development of the industry as a whole, and result in the introduction of ore-dressing, which will in turn stimulate the exploitation of the lower-grade deposits.

Simplefyde Spellin

The following example of natural spelling is the work of a shift-boss in one of the iron mines of New Jersey. We commend it to spelling reformers as suggesting such changes in the English language as they may see reason for advocating.

"July 22. Mike Fired all Over Tell Timber men them Bolts For 12 Chut is to short 2 inches to short tell them Kut Out Kupple them plonk for 1000 chut i lef all plok in Box Kut out that Long.

"Tell Big John Jess men vork in 1003 on Left Side machine Drill that Botom in Drift litle Loo can put no Track in them Drilling F Block Hole making Place for Track them Bolts vhat i Taking Down is By no 12 chut."

In 1913 the total production of coal in New South Wales, Australia, was 10,414,165 tons, and in 1914, 10,390,622 tons; in 1915 it decreased in consequence of the War to 9,449,008 tons, and reached the low-water mark in 1916, when there was only 8,127,161 tons produced. The production has increased again to 9,063,176 tons, and if there is no further disturbance in the trade the probabilities are that it will continue to materially increase, and there will be a better prospect for tonnage on American vessels to Australia, as they can discharge at Sydney and load coal at Newcastle, which is only about six hours run from Sydney by boat. The Government of New South Wales appointed a Federal commission to examine into the coal situation and ascertain whether an increase in wages, which would imply a sharp advance in the price of coal, would be justified. Following the appointment of the royal commission, the Federal government issued an order commandeering all the coal in the Commonwealth, and the miners have received their increase by about 3s. (72 cents) per ton from May 5, 1919.

The Guild in Labor Organization

By P. B. McDONALD

In these days of labor unrest, when a workable solution of the industrial problem is being eagerly sought, occasional references are made to the guild system of labor organization which worked so happily in the Middle Ages. The guild system gave satisfactory results for several centuries, during which many of the great Gothic cathedrals were built, and the Merrie England of those days appears so attractive in the light of history that modern students are comparing the medieval guilds with present-day trade-unions.

Mr. G. H. D. Cole, a writer in the British periodical 'Reconstruction', discusses 'Reviving the Guild Idea' as a promising phase of industrial democracy. Mr. Cole explains that the medieval guilds were made up of master-craftsmen with their journeymen and apprentices. The important point appears to be that the workers had control of the industry under a plan of self-government made possible partly by the local nature and informality of method of the enterprise. Each town was as nearly as possible self-sufficient, since centralization and intercommunication were as yet scarcely practicable, although journeymen traveled to pick up new ideas.

Mr. Cole suggests that a modern adaptation of the guild idea should have the following differences: The trade-unions can be taken as a basis, and salaried workers should also be included; these organizations should be related closely to the State somewhat as the guilds were to the municipality. There will be more and more tendency, the author thinks, for the State to own and control industry; he says, "the democratization of the industrial system will make possible a parallel democratization of the political machine." Thus he would have manual workers and brain-workers co-operating in great collective groups in which democratic control and social service would be the prevailing watchwords. A man would be cheered at his work by the thought that he was not a commodity, as labor is now, but a free sharer in an enterprise serving and controlled by society. The guild system would reconcile freedom and order.

The author of the article considers that society is evolving in the direction that he indicates, and that the transition can be made peacefully and gradually. He implies that the change may be consummated more surely and less wastefully if a study of the medieval guilds is made and discussed. As G. G. Walsh recently pointed out, in England during the 13th century among a population about equal to that of New York City, twenty magnificent cathedrals were built with an artistic craftsmanship and understanding of architectural effect that we cannot rival today. The guilds built these cathedrals, which are beautiful because they represent the free ex-

pression of men interested in their work and anxious to symbolize the eternal seeking for ideals of a race of human beings enshrouded in religious mysticism.

Probably there is nothing strikingly new in Mr. Cole's article. In the main, it is an argument for industrial democracy based on a scheme of organization and administration that gave excellent results seven centuries ago. He argues that "it is impossible to have a really democratic political system while the economic system remains undemocratic, and continues to be based on the denial of the humanity of labor."

Perhaps the first observation that comes to mind on hearing of such a suggestion is that it is not so much the machinery or scheme of a reform that is important as it is the phases of human nature with which the problem is associated. It is necessary to alter social ideals before a scheme will be found to work. There is something to be said for Carlyle's sarcasm about reforming by "tremendous cheers"; he pointed out that "no single man can reform himself without stern suffering and stern working; how much less can a nation of men." And the censor of his age continued, "Medea, when she made men young again, was wont to hew them in pieces with meat-axes, cast them into cauldrons, and boil them for a length of time. How much handier could they have done it by 'tremendous cheers' alone!"

The point is that the spirit is more important than the machinery; reform must come from within. If the modern employer and his employee can learn to understand each other better and co-operate more imaginatively by a study of the medieval guilds, more good might come of it than by calling a trade-union a guild and adopting some of the old customs. Without doubt a better knowledge of the workings of the guilds would help to elucidate some of the perplexities of modern industrialism, in spite of Henry Ford's observation that history is 'bunk'. Yet great historical betterments are achieved by changes in ways of thinking, just as the greatest gain from the War is said to be such a quickening of mind and conscience as people seemed too stupid to attain without being forced into it. How to get employer and employee to understand and appreciate each other, to cease from distrust and dislike, and to realize the interdependence of labor and leadership is a problem in education in the broader sense of that term. It could be helped by intelligent journalism, by the choosing of thoughtful political representatives, and by individual cultivation. The greatest hindrances to industrial improvement are ignorance, misdirected selfishness, and lack of imagination for putting oneself in the other's place.

MOUNTAIN COPPER COMPANY'S No. 1 CONCENTRATOR, LOOKING SOUTH

The No. 1 Concentrator of the Mountain Copper Company

By LLOYD C. WHITE

The crushing-plant is on Iron mountain, in Shasta county, California, at an elevation of about 2400 ft. The milling ore, which consists of chalcopryite and pyrite in an alaskite-porphry gangue, is delivered to the receiving-bin from No. 8 tunnel by electric haulage. The bin is covered with 30-lb. rails, spaced 10 in. centres. One man with a sledge-hammer breaks the oversize pieces. Another man feeds No. 1 conveyor from one of the six ore-gates. Referring to the flow-sheet, it will be seen that No. 1 conveyor has, at all times, a bedding of fine ore; this protects it in a measure from the large rocks, which strike the belt with considerable force. From No. 3 conveyor a small tonnage of high-grade chalcopryite is picked for shipment direct to the company's smelter at Martinez, California. All the remaining ore is crushed to pass a 2½-in. ring and distributed by No. 4 conveyor to the storage-bin on the railroad. The crew at the crushing-plant consists of one foreman, one oiler, one feeder, one roustabout, three high-grade pickers, and one man at the grizzly. The capacity of the crushing-plant is 600 tons in eight hours. This is ample to supply the mill and allow the time necessary for repairs. A 100-hp. motor drives the plant.

The ore is hauled five miles over the Iron Mountain railroad to the concentrator at Minnesota station (elevation 1600 ft.). The narrow-gauge ore-train consists of a Shay engine and seven cars, each of 20 tons capacity.

No. 1 MILL

The No. 1 mill was one of the first in California to

THE No. 1 CONCENTRATOR, LOOKING NORTH, SHOWING ENGINE PUSHING BALL-MILL INTO THE BUILDING

use flotation. At the start it was of 200 tons daily capacity, but this was increased to 550 tons during the early part of 1917. This was accomplished by the substitution of two ball-mills in place of two sets of 16 by 36-in. crushing-rolls and the addition of two Dorr classifiers and a larger flotation machine. The grinding section is in two units so that the mill can always be operated at half-capacity when either ball-mill or Hardinge mill is shut-down for repairs. The ore is ground so that not more than 4% remains on a 60-mesh screen. Four and five-inch chrome-steel balls are used in the ball-mills with a consumption of 1.8 to 2 lb. per ton of ore. Chrome-steel liners have to be replaced about every four months. Most makes of ball-mills today properly installed and with ordinary attention give very little trouble. The principal thing, as with all machinery, is to make repairs the moment they are needed. Often near the end of the month the mill-foreman is so bent upon making a 'big showing' that he will put off all repair work until the first of the next month. In the case of mill-linings he often regrets this course when he discovers that the shell of the mill has been damaged. Open-end feeders for ball-mills grinding 2½ to 3-in. ore are a great improve-

ment over the pick-up type of scoop-feeder. With this latter type of feeder the ore builds up solidly from the bottom of the feed-box and becomes so hard that when an extra large rock becomes wedged between the revolving scoop and this solidified ore, something has to give way. I was in a mill recently where this had hap-

The mill-superintendent can usually improve on the design of liners for grinding-mills by observing which part of the liners wears out first and re-enforcing this part of the pattern. Two or three changes may be necessary, but finally a balanced liner is obtained which will wear out in all sections at about the same time, thus leav-

FLOW-SHEET OF MILL

pened and the scoop was broken into several pieces. Not having a spare scoop on hand, they were obliged to gather up the pieces and rush to the nearest foundry, several miles distant, to have a pattern made and a new scoop cast; in the meantime the mill was running at half-capacity with resultant high costs, to say nothing of the inconvenience to the mine. An open-end feeder would have obviated this delay.

ing a minimum of metal to be scrapped. It is perhaps needless to add that this is an important matter, considering the price of chrome-steel.

The Hardinge mills require a minimum of attention. A set of W-B liners in the cylindrical part of the mill and one set in either direction last about ten months, while the liners near the trunnions last much longer. It is not necessary to unload the mills to make lining

renewals. Herringbone pinions driving these mills last 22 to 26 months. At present, pebbles from San Diego county are used, with a consumption of 6 to 7 lb. per ton of ore.

The flotation section consists of a single 16-cell 24-in. standard Minerals Separation machine. Should anything go wrong with this machine, the whole mill would have to be shut-down. This happens so infrequently that it is hardly worth mentioning. During nearly two

cone, and so on. The overflow from the cones goes to a Dorr thickener. Generally the froth breaks up readily, otherwise this cone system could not be used. One object of these cones is to provide storage for concentrate, so that it is necessary to run the filter only half-time. This storage also makes it possible to re-wind the filter without shutting-down the mill. The chief object of these cones, however, is to collect the coarser part of the concentrate, amounting to about 75% of the whole.

This coarse concentrate is drawn to the Oliver filter, where it forms a cake two to three inches thick with a moisture content of about 9%. The colloidal part of the concentrate, which is drawn from the Dorr thickener, is filtered separately and forms a cake on the filter about $\frac{3}{4}$ -in. thick, averaging 14% moisture. If the entire concentrate goes direct to the Dorr thickener and is filtered, the cake formed is about $\frac{3}{4}$ in. thick and averages 13% moisture. Thus it is seen that the cone system shortens the time of filtering and gives a final drier product, averaging something over 10% moisture.

After the concentrate has remained in a cone several hours it becomes quite solid; the cones are fitted as shown in the sketch (Fig. 1) to 'break-up' the

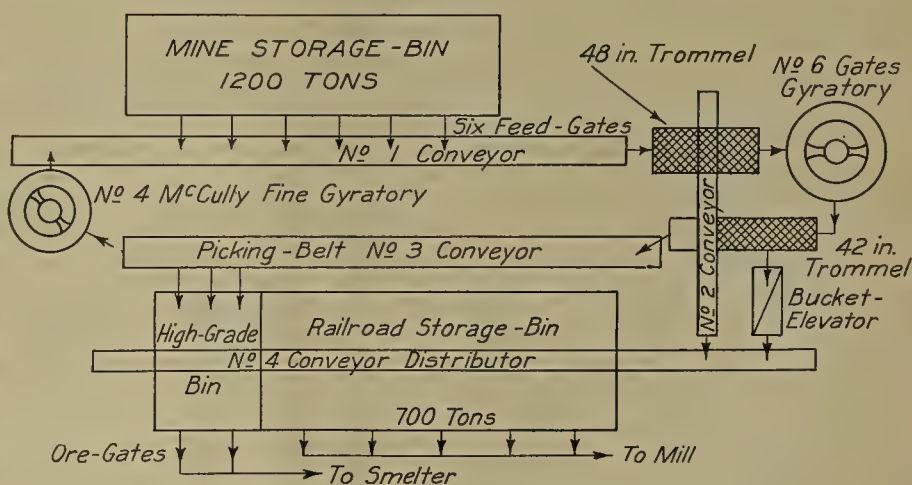

FIG. 1. SKETCH OF CONE-DISCHARGE

years operation the only repairs on this machine have been two sets of impellers, box-linings, and one set of regulating-valves.

The ore averages about 2% copper, with 8% iron, and the concentrate runs about 15% copper. The average recovery is 92%. The ratio of concentration is about 7:1. The consumption of reagent averages 0.8 lb. per ton of ore; approximately 50% of the reagent used is kerosene-acid sludge, the remainder being a mixture of crude turpentine, tar-oil, and light fuel-oil. Oil is added ahead of the Hardinge mills, and oil and sludge are added to the impeller-boxes wherever required. The pulp is kept at about 30% solid. The froth from the last four to six boxes of the flotation machine is returned to box No. 1 for re-treatment. The froth from the remaining boxes is taken as concentrate and delivered by a bucket-elevator to one of four 8-ft. cones. The entire flow goes to one cone until it is filled, then it is diverted to another

FLOW-SHEET OF CRUSHING-PLANT

concentrate. A little high-pressure water is added and then the concentrate is turned on; this causes the concentrate to 'boil' and is kept up for about 5 to 10 minutes, after which the concentrate is readily drawn to the filter. The concentrate is conveyed from the filter to the cars of the Iron Mountain railroad, to be hauled to Keswick and there transferred to broad-gauge cars that take it to the smelter at Martinez.

The operating crew consists of one flotation man and

one oiler per shift. In addition to these men, three roustabouts on day-shift dump the ore-cars as the trains arrive, put in balls and pebbles in the grinding-mills, clean-up the mill, draw the flotation oil, unload supplies, do repair work, etc. There are two filter-men, but one of them devotes only half his time to filtering, being available for repair work, sampling, etc. Thus, including one foreman, a total of 12 men comprises the mill-crew.

There are eight motors in the mill with a rated capacity of 592 hp. Electric power is furnished by the Northern California Power Company.

TNT for Blasting

TNT is formed when toluene is treated with nitric acid in the presence of sulphuric acid. Toluene is a liquid substance which is produced from soft coal in the process of making coke, coal gas, and coal tar, and is recovered for use from both the gas and the tar. It is also made in other ways. The name TNT is an abbreviation of trinitrotoluene, which is the name given by chemists to the explosive in order to state its composition, and thus distinguish it from many other nitrotoluenes known to them. TNT did not become widely known until the Great War, when it came to be extensively used as bursting charges for high explosive shell, depth bombs, mines, torpedoes, and other devices, and in demolitions where very violent detonation effects were sought with the largest measure of safety from these effects to the users. It was also used in admixture with other substances to produce other military explosives such as amatol and sodatol. Because of the devastating effects produced by its explosion and because of many disastrous accidents which occurred during the manufacture and transportation of large quantities of TNT under the hurried conditions necessitated by war conditions, many have concluded that TNT is an especially dangerous explosive. In reality it possesses characteristics that render it less dangerous than many explosives generally used in our industries. Thus it has been found more difficult to explode with certainty than nitroglycerine, dynamite, or gun cotton.

With the cessation of hostilities this country found itself with large supplies of TNT on hand, so large that it was deemed unwise to keep all of it in storage awaiting future military use and it was proposed to devote many million pounds of it to industrial use. Although nitrotoluenes in admixture with other substances have been used as industrial explosives to a certain extent for more than a decade, TNT, for several reasons, but especially because of its special value as a military explosive, has not been used in industrial blasting except tentatively. It is not surprising therefore that objections should have been made to its suggested use as an industrial blasting agent. It may, however, be safely and efficiently used in industrial blasting operations by those skilled in blasting, as the results of careful experiments and observations made at the Bureau of Mines Experiment Station show.

When chemically pure TNT is a pale yellow crystalline substance which acquires a deep yellow to brown color on exposure to light. It melts at about 80.5°C., and when molten can be cast into molds, or granulated by chilling in water. TNT may therefore appear in granulated crystalline form, in pebbled or pelleted form, or in blocks or other cast forms. As offered by the Department of the Interior for use in blasting it is in the granulated crystalline form. The War Department secured and has allotted to the Department of the Interior for industrial use three grades of TNT as follows: Grade I having a setting point (S.P.) of 80°C.; Grade II, S.P. 79.5°C.; and Grade III, S.P. 76°C. It is more difficult to detonate with certainty than nitroglycerin, dynamite, or the explosives ordinarily used in engineering operations. Charges require a No. 8 detonator, whereas dynamite and the other high explosives ordinarily used in industrial operations require but a No. 6 detonator. As shown by tests all three grades of TNT are less sensitive to friction than 40% dynamite, gelatin dynamite, or picric acid, and all are less sensitive to percussion than 40% dynamite, ammonia dynamite, and nitrostarch powders. It may be set on fire, when it will burn, but this burning may change to a detonation. Hence TNT must be protected from fire and causes of fire, such as sparks, flame, heated bodies, friction, percussion, and the like, as all explosives should be at all times. It is toxic, but, unlike nitroglycerine, rather long contact with TNT is required before its toxic effects become of moment.

In tests made at the Pittsburgh Experiment Station by detonating TNT, Grade I, it was found that 454 grammes (one pound) of the explosive gave 506.5 litres of gases having the following composition: CO₂, 4.9% by volume; O₂, 2.5%; CO, 46.6%; H₂, 24.6%; CH₄, 2.6%; N₂, 18.8%. From this it appears that there was produced 46.6%, or 236 litres of a poisonous gas (CO) and 73.8%, or 373.8 litres of combustible gases (CO, H, and CH₄). The tests of other grades of TNT gave similar, though not identical results, but all indicate it to be unsafe to use TNT in close places, such as underground workings and particularly coal mines. These results emphasize the importance of remaining away from the face of the blast after the explosion until assured that the gases produced have been blown or have diffused away from the interstices of the debris. These precautions are such as should be taken with all explosives.

In determining the relative efficiencies of explosives in use, the Bureau of Mines has long employed the unit defective charge and the rate of detonation as criteria. Taking 40% nitroglycerin dynamite as having a defective power of 100%, Grade I TNT has a defective power of 113%. This is considered the measure of the ability of an explosive to dislodge and bring down material in which it is exploded. Similarly the rate of detonation of Grade I TNT, which is considered the measure of the ability of an explosive to disrupt and shatter, is 99% that of 40% dynamite. Other grades of TNT show only slight variations from these figures.—C. E. Munroe and S. P. Howell in the Bureau of Mines.

Siberian Mines and Mining

By CHESTER W. PURINGTON

The years 1907 to 1915, inclusive, witnessed a remarkable activity in the development of a few of the gold and base-metal deposits of Siberia and the Ural, under the auspices of British capital and the technical control of American engineers.

COPPER. The Kyshtim Mining Corporation was built up from the ruins of a semi-defunct Russian company which had mined copper in a desultory way for a period of nearly a century before 1919. About £900,000 sterling was raised in London by means of debentures, and pyritic smelting of the ore was introduced from abroad. This was found to be the salvation of the property, and under the able direction of T. J. Jones, R. Gilman Brown, D. P. Mitchell, and H. H. Knox, the Kyshtim from being an abandoned mine became the largest copper producer in the Russian realm. In 1916, the last full producing year, the output approached 15,000,000 lb. of metallic copper. This, although large for Russia, is only from one-quarter to one-tenth the output of the large 'porphyry' mines of the United States. A considerable output in gold was obtained yearly as a by-product.

The published reports indicate that when the mine was closed down owing to 'nationalization', some three million tons of 3% ore still remained in reserve. Much of the ground is still unprospected, and besides important iron deposits, which ore exploited successfully, an important discovery of nickel ore has been made. The cost of producing copper at this property in pre-war days compared favorably with the average cost at American copper mines. Following the political crash in Russia, the cost became prohibitive, and at the present time, since only destructive work is in progress in the Ural and in Russia, there is no demand for the product, even did the political conditions allow of the property being operated. It will probably take from three to five years to restore this property to its former productiveness, even after the restoration of peaceful conditions in the Ural.

Other copper mining properties in the Ural were the Sissert Co., the Verk-Isetz Co., the Bogoslof Co., the Revdinsk Co., and the Tanalyk Corporation. In the Kirghese steppe region, the Atbazar Mines and the Spassky Co. also operated in a small way. The last three mines mentioned were largely controlled by British capital.

Both the Sissert and the Revdinsk properties, near Ekaterinburg, were in the development stage, but with good promise for the future, the ore being in many respects similar to that at Kyshtim. The Tanalyk property, in the Orenburg district, although started as a copper mine, was proving to be a more important producer of gold than of copper when operations were suspended in 1917.

A most important copper deposit of the 'porphyry' type, that is, disseminated copper ore, is stated to have been partly prospected by drilling by the engineers of the Irtysh Corporation. This property is situated near the Ekibastus coalfield west of Pavlodar. In the published reports the company has merely referred to the deposit in a general way, but it is said to be of large dimensions.

Altogether the production of copper in Russia and the Caucasus in pre-war days was small, not filling the demand. It was infinitesimal as compared with what will be possible when the known deposits are exploited. Siberia, unquestionably the world's greatest store-house of copper as well as of gold, produced practically no copper previous to the closing-down of industry due to the revolution.

It should be noted that the price of copper in London has dropped during the past eight months from £153 per long ton to about £77 at last advices, so that notwithstanding the bounty of £23 odd per ton given by the Russian government to copper producers, it is not likely that domestic producers will be able to compete with imports for some years to come. Probably the first successful copper mining on any considerable scale will be in the porphyry deposits, which can be mined by open-cut with steam-shovels, a minimum of hand labor being required.

LEAD, SILVER, AND ZINC. The two well-known base-metal districts of Siberia are the West Altai and the Nerchinsk-Argun. A less known region recently developed for the production of zinc is the Te-Hu-He, about 200 miles north of Vladivostok, only 20 miles inland from the coast.

Notwithstanding the fact that the Nerchinsk mining district was known over two hundred years ago, it, like the Altai, is still in the development stage. Both these districts are extensive, as large as whole States in the United States or Mexico, and contain deposits of great importance. They have both been held since discovery as the private property of the Russian Crown, only lately abolished. An antique system of administration retarded the development of lead and zinc mining in both the Altai and Nerchinsk mining regions and stifled any attempt at industry. A certain amount of silver was produced from rich surficial ores during the past century and a half, largely by forced labor.

In 1912 the Russo-Asiatic Corporation was formed in London, and D. P. Mitchell was sent to examine the so-called Cabinet Concessions in the West Altai. He selected the three largest mines, the Ridderski Kope, situated about 50 miles north-east of Ust-Kamenogorsk. A lease was obtained from the Cabinet of the late Czar, and

the Irtysh Corporation, with a capital of £2,000,000, was founded to develop and operate the property. This company also obtained the control of the Ekibastus coal mines, formerly part of the Popof properties, west of Pavlodar, and connected with the Irtysh river by 50 miles of standard-gauge railway. In the past five years, up to 1917, another railway has been constructed by the company, connecting the Riddersk and Sokolni mines with the Irtysh. Coke-ovens and zinc-retorts have been constructed, a concentrating plant has been erected at the mines, and a large amount of development and diamond-drilling has been accomplished on the ore deposits. Some of the best mining and metallurgical talent has been employed, and the problem of treating the complicated base ores has been solved. All preparations were made for a regular and profitable output of zinc, lead, silver, and gold, which were the four principal recoverable metals present in the ore.

It is estimated by competent engineers that the amount of ore in the Riddersk and its neighboring mine the Sokolni was sufficient on a conservative basis to net the shareholders £10,000,000 in the course of ten to twelve years after operations were well under way. This was only estimating ore at a moderate depth in two deposits, while over twelve other deposits of the famous 'horn-stone' were known on the property, where surface indications were of similar character to these developed mines. Beside this the coal mines of the company were under competent management and a large amount was spent in preparations for a steady production, both for coking purposes in smelting the ores and for filling contracts with the Trans-Siberian railway.

It should be noted that the estimated production of the Riddersk mine in gold, merely as by-product, amounted to £1,000,000 annually, or as much as the average production of the Lenskoie Gold Mining Co. previous to 1915, which produced 25% of the gold output of Siberia. It is one of Russia's unwritten tragedies, not yet realized, that this fine fabric of industry, the result of the considered thought and well-directed energy of high-class specialists, should be brought dangerously near the verge of destruction just on the eve of its fruition, by the senseless acts of those who stood to gain the most good from it.

Other portions of the Altai zinc-lead domain have been developed by the Russian Mining Corporation, of London, and this company in 1916 made copper discoveries which may prove of importance. Altogether, it is stated that 4000 prospects exist in the Altai region showing silver-lead ores, only a small percentage of which has been worked or even looked at during the past three or four decades.

The Nerchinsk mining region, known to English readers since the time of Robinson Crusoe, who may be said, if one is to believe De Foe, to have been the first Trans-Siberian traveler, has not been the object of modern development. There are indications that it may yet become the seat of profitable base-metal mining, and it is perhaps fortunate for the future Siberian commonwealth that this great area has, as it were, been protected from

half-hearted private exploitation in the past by the old Cabinet system. Under that regime the convicts merely 'gophered' the rich streaks of silver ore near the surface and did not attempt any systematic mining of the larger masses of lead and zinc ore.

The Coast region, as has been stated, boasts the Te-Tu-He zinc mine, which has produced in the past few years a notable quantity of high-grade ore, and is not unlikely to be of importance in the future for the production of mixed base ores on a considerable scale. This region has the great advantage of being near tide-water, and therefore is not dependent on domestic market for the concentrate and spelter it produces. Ample deposits of coking coal are also available in the vicinity; therefore, should these ore deposits prove extensive, it is highly probable that the southern Sikota Aline may become the seat of an important lead and zinc smelting industry.

GOLD. Alexander von Humboldt is authority for the statement that gold has been mined in Siberia since the time of Herodotus, and the probability is that it was mined many centuries before that historian was born. All travelers in the southern Altai agree that ancient workings are numerous, although dates are not assigned. It is highly probable that much of the gold wrought into personal ornaments by the Greeks of the Chersonese found its way there from the Altai.

The recorded production of Siberia and the Ural since the middle of the 18th century is something under \$1,500,000,000 and with the thieving and illicit production which is the invariable accompaniment of gold mining, one may place the output during this historical period at not less than \$200,000,000. The greatest single contributions to this output have been from the North Yenesei district and the Vitim district, which may be estimated at \$250,000,000 and \$400,000,000 respectively.

In 1754 a 12-stamp mill was erected by a German engineer at Bereozovsk, near Ekaterinburg. The property on which this mill operated has continued to produce both quartz and placer gold with more or less regularity up to the present day. Up to 1820, when the location of claims was first allowed by private parties in Siberia, the Ural produced most of the gold recorded. Quartz mining was never an important factor, and placer mining became the chief source of the metal.

In the late 30's, the North Yenesei came into prominence, and several years before the discovery of gold in California this district was producing at the rate of from \$5,000,000 to \$7,500,000 per year. About 1842-'50 the deposits became exhausted according to the standard of work carried on, and the miners migrated east. One Trapeznikof located a claim on the Homolko river, a branch of the Zhuya, in the Olekma district in 1847, and there was a rush to the district, now famous the world over as the Lena.

It was not, however, until 1867 that Michael Sibiryakof located the Blagoveshensky mine on the Nakatami, a branch of the Bodaibo creek, tributary to the Vitim, and is said to have found by chance the deep-lying gravel that has since made this stream and the Bodaibo known wherever placer mining is talked of. The claim men-

MAP OF PARTS OF SIBERIA AND MONGOLIA

tioned proved the richest gold-gravel area of which we have record in the world, 1,000,000 cubic yards of bedrock gravel having produced \$15,650,000.

The fame of Bodaibo creek, which may be safely estimated to have produced over \$200,000,000 in 40 miles of length is too well known to need description. A really considered it is but a fraction of the gold-bearing territory of the Vitim and Olekma districts, and although worked out by the present Lenskoie company, there still remain important reserves of gold to be worked by modern contrivances.

Up to 1914 the methods of drifting used by the Lenskoie Gold Mining Co. were of that archaic description introduced into the Ural by some disciple of Agricola in the time of Katherine the Great. The so-called washing machines were of great historic interest, and one regretted that on account of their bulk it was impossible to transport them to some museum of antiquities in one of the world's great capitals. Fortunately, in 1913 Reuben E. Smith, a mining engineer and specialist on placer mining, was engaged by the company. He at once set to work to improve the methods employed, and in the course of three

THE THURN & TAXIS CONCESSIONS IN THE ALTAI REGION

years in the face of most intense opposition by the Lenskoie board and many of the local officials of the company, succeeded in greatly reducing the cost and increasing the gold output. Stealing of coarse gold from the drift faces and dumps which had for several years past averaged \$1,500,000 annually, was reduced to less than \$500,000 in 1915. This was the result of the introduction of all-the-year washing of gold instead of exclusive summer washing as formerly. A most ingenious system was developed by Mr. Smith which allowed of the gold being washed every day of the year, even at the record winter temperature of 1914-'15, when on the coldest day 88°F. below zero was recorded.

By this and other improvements, such as the introduction of standard Alaskan sluices, it became possible to save the fine gold which had formerly been lost. The output was gradually raised until in 1915 the record output of this property of \$9,000,000 in gold was recovered in one year. This, in fact, was the largest output in that year of any gold mine, either quartz or placer, in the world.

Underground improvements, such as the recovery of timber put into the workings, the reduction of man and horse power, and all-round general cost-cutting factors had been introduced and the Lenskoie property so far as working cost and production were concerned was fast getting in line with the world's well administered mines; but, unfortunately, the board at Petrograd had engaged the doctor when the patient had nearly expired, and the inevitable fact remained that Bodaibo creek was worked out. Therefore, irrespective of any political disturbances, the Lenskoie output began to decline in 1916, and has done so steadily since. Although it is reported that the property is still being operated, the 1919 output will probably not reach more than 20% of the 1915 output.

New discoveries of 'drifting' gravel are reported from eastern areas of the property, remote from Bodaibo. While it is possible that these will lend for a time a new life to the property, a thorough liquidation of the present organization will be necessary before even the richest gravel can be worked at a profit. Ancient poodage rights, imports, etc., exist on many of the best claims, serving to handicap their profitable exploitation, even were all the unnecessary overhead charges eliminated.

Outside the Lenskoie company, the output of any one mine in the Siberian or Ural territory is insignificant. The aggregate pre-war annual output of Russia was from \$25,000,000 to \$30,000,000 in gold. This was less than the daily cost of the war to Great Britain. Of this sum, the Lenskoie company annually contributed from 25 to 30%. Thus, notwithstanding the fact that Siberia promises to be the world's great gold-producing country of the future, it may be said to be at that turning point where the alluvial gold is largely worked out and the initiation of quartz mining, and the obtaining of gold as a by-product from base metal mines, has not commenced.

To select the areas where deep mining will be possible, and to develop the deposits, and apply the proper processes for extraction of the metal will require the services of foreign engineers from America, South Africa, and

Australia. There is no intrinsic reason why the Siberian output should not eventually equal or even exceed the present annual output of the Transvaal, but the evolution of the industry will be slow, as it has been in other countries.

Gold-dredging, which has attained success in other countries, will also have a wide field, but up to the present it has hardly commenced. Out of some 50 dredges that have hitherto been installed in various districts in Siberia, only about five are of any value as machines. Two of these are on the Pacific Coast, on the property of the Orsk Goldfields, and three are in the Ural, at the property of the Nikolai Pavdinsk company. Gold-dredges are only significant in increasing notably the gold production of a region when they are installed in multiple units on large

areas, since the recoverable content of the gravel on which they operate is generally very low, a few cents per cubic yard.

PLATINUM. I am credibly informed that 27 so-called dredges in the Ural region, mostly on the Iss and Tagil fields, were sunk during the political disturbances, but with one or two exceptions, one may say that the loss of these mechanical contrivances is not greatly to be deplored. For the sake of the future of the platinum industry, it is to be hoped they will remain scrapped and be replaced by modern dredges.

The entire platinum output before the War averaged about 150,000 oz. troy annually, and so far as can be gathered it dwindled to 80,000 oz. in 1917. The Iss field, by far the most important, if worked intensively by dredges for ten years with an annual output of say 300,000 oz., would probably be exhausted. It is not unlikely that other platinum districts will be discovered, either in the Ural or elsewhere, to take the place of this field when exhausted. It is also possible that certain zones of the Iss dunites may be found workable as a rock-source of platinum, since it is known that the platinum occurs in the dunite in recoverable quantity. The same may be said regarding the adjacent less important fields of the Pavdinsk estate and the Tagil.

The gold deposits of the Oatman district, Arizona, occur in fissure-veins that traverse all the rocks of the region. The veins apparently are identical in character and are equally mineralized and of the same vein-matter in all the rocks, which consist of andesites, trachytes, rhyolites, latites, and basalts.

'The Survey of Cornwall'

By J. C. MURRAY

There is both refreshment and profit in discovering for one's self the points of view of old writers on matters pertaining to mining. Mirth and edification walk hand in hand as one reads the pages of the volume whose title is displayed above.

Richard Carew, the author of 'The Survey of Cornwall', was born in the year 1555, at "East-Antonie, in the eastern part of Cornwall, within some miles of Plymouth". As a youth such was his precocity that he became a gentleman commoner of Christ Church when but 11 years old. At 14 years of age he engaged in a public debate with the "matchless" Sir Philip Sidney. Concerning his subsequent career, there are but hazy accounts. What is certain is that he became an ardent observer of natural history.

In the year 1602, Carew published his 'Survey of Cornwall', and dedicated it "to the Honourable Sir Walter Raleigh, Knight, Lord Warden of the Stannaries, Lieutenant Generall of Cornwall". His dedication is more than ordinarily ingenuous and naive. It commences:

"This mine ill-husbanded Survey, long since begun, a great while discontinued, lately reviewed, and now hastily finished, appealeth to your (Lordship's) direction, whether it should passe; to your correction, if it doe passe; and to your protection, when it is passed."

He prays that "each wel-minded Reader will wish a merrie passage, to this my rather fancie-sporting, than gaine-seeking voyage;" and, before getting down to real business, he indites a charming little "Prosopopeia" of five verses, one of which runs thus:

"I curry not with smoothing termes,
Ne yet rude threats I blaste:
I seeke no patrons for my faults,
I pleade no needless haste."

Herefrom could many an over-deprecatory author learn wisdom!

Nearly every page of the 'Survey' is tempting. However, we must content ourselves with those touching on mines and mining.

A brief sketch of the topographical features of the 'Duchy' closes with the remark that "in the rest of this earthy description, I will begin with such minerals as her bowels yeeld forth..... These minerals are not so deepe buried in the entrailes of the earth, nor so closely couched amongst the Rockes, but that desire of gaine with the instrument of Art can digge them up: they may be divided into stones and mettals."

Quarry-stones, pebbles yielded by the "sea-strond", slate, and limestone are successively dealt with. As to copper, our author confesses to small knowledge and less

curiosity; for he states that at one mine the ore was shipped to Wales to be refined, whether to save cost of fuel, or to conceal the profits, he does not care to venture a guess.

Silver is dismissed with the statement that although it is found, nature has not been lavish, for "what she proffereth with the one hand, shee seemeth to pull backe with the other."

The tin miners, Carew asserts, found "little hoppes of Gold" in their ore. These they kept in quills and sold to goldsmiths, but with little or no profit.

Diamonds, he declares, are found cleaving to the rocks in which tin is mined. "They are polished, squared, and pointed by nature," from which we may estimate Mr. Carew's acquaintance with crystallography.

On tin our worthy observer becomes eloquent: "But why seeke wee in corners for pettie commodities, when as the onely mynerall of Cornish Tynne openeth so large a field to the Countries benefit? this is in working so pliant, for sight so faire, and in use so necessarie, as thereby the Inhabitants gaine wealth, the Merchants trafficke, and the whole Realme a reputation: and with such plentie thereof hath God stuffed the bowels of this little Angle, that it overfloweth England, watereth Christendome, and is derived to a great part of the world besides." Thus delightfully does Carew ramble in dithyrambic prose.

Amongst other things, we are told of the Cornish miner's belief that Noah's flood, moving from east to west, on its course to the sea, produced by denudation all the alluvial tin. Stories of the discovery of tin veins ("loads") by means of dreams are repeated, though the author carefully refuses to guarantee their credibility.

Prospecting is described succinctly, but picturesquely, in one paragraph. "Shoad", the drift "shed from the maine Load, and made somewhat smooth and round, by the waters washing and wearing" is sought for by casting up trenches five or six feet deep and three or four wide. Rivers are turned from their courses, a practice to be condemned as being "little beneficiall to the owners of the soyle" since the low grounds have "herethrough their wrong side turned outwards."

Prospecting to find the "loadworkes" begins by "conjecturing by the sight of the ground which way the flood came that brought it thither, and so give a gesse at the place whence it was broken off." At that place a shaft five or six feet by two or three feet is sunk to a depth of seven or eight "to prove whether they may so meete with the Load" "But", advises the cautious Carew, "you may not conceive that every likelihood doth ever prove a certaintie: for divers have beene hindered.

through bestowing charges in seeking, and not finding, and many undone in finding and not speeding, whiles a fair show, tempting them to much cost, hath, in the end, fayled in substance, and made the adventurers Banckrupt of their hope and purse." A fair epitome, this, of the whole matter.

Carew speculates engagingly as to whether or not tin minerals grow in the rock. He discreetly leaves the question open after quoting authorities *pro* and *con*. A rich tin vein is described as one that "carrieth a foote and a halfe in breadth, and is not overbarren," a definition worthy of the most non-committal geologist of today. To work such a vein, the discoverer, unless his purse is "lined beyond ordinarie," associates himself with some more partners, who are either practical 'tinnners' or else adventurers willing to contribute money. The laborers, be it noted, worked for eight pence per day, or, if paid by the year, for from four to six pounds, out of which wages they paid their own keep.

Should the new mine assume respectable proportions it was duly christened and a mine overseer, or captain, appointed. In most places, according to Carew, the toil was so extreme that a shift lasted only four hours, no miner working more than the one shift. "The residue of the time they wear out at Coytes [quoits], Kayles, or like idle exercises. Their Kalinder also alloweth them more Holy-dayes than are warranted by the Church, our lawes, or their own profit." Carew had first-hand experience of the Cornishman's passion for pastimes, some of them so strenuous as to result in serious wounds and even in deaths. Farther on in the 'Survey', in discussing the rough game of 'Hurling to the Countrie', he remarks that the players retired home as from a pitched battle. Yet there was always evident the sporting spirit. "All is good play, & never Attourney [lawyer] nor Crouner [coroner] troubled for the matter."

To proceed with mining, however. The manner of working was "to follow the Load as it lieth, either side-long, or downe-right."

But here our friend Carew falls into heterodoxy by asserting that "both waies the deeper they sincke the greater they find the Load." Alluding to open stopes, he states that "from some of their bottomes you shall at noone dayes discrie the Starres." The miners were let down and hoisted up in a 'stirrup' by two men on a windlass. Shaft-sinking and drifting and the problems of ventilation are mentioned. Sympathy is expressed for the poor miners who meet death through falls of rock. Foul air and mine-gases are thus touched on. "While they [the miners] thus play the Mouldwarps, unsavorie Damps doe here and there distemper their heads, though not with so much daunger in the consequence, as annoyance for the present." Sometimes the rock was so hard that a good workman could "hew" only three feet in as many weeks. Pumping was effected by man-power, horse-power, and water-wheels where drainage could not be had by means of "addits" (or "audits"). Carew marvels greatly at the engineering skill of "other-wise thicke clouded braines" in driving these "audits".

He is also wonder-stricken that the operators should be "anyway able to acquite the cost" of the subsequent dressing, breaking, and stamping of the ore. The stamp-mill of the day, to which the ore was conveyed either "in waynes or on horses' backs," consisted essentially of "three, and in some cases sixe, great logges of timber, bound at the ends with yron, and lifted up and down by a wheele, driven by the water." From the stamping-mill the ore passed to the "crazing" mill, where it was fed between two grinding-stones (actuated by water or man-power) and there "brused" [bruised] to a fine sand.

But innovations were already creeping in. "Of late times," the author remarks, "they mostly use wet stampers, and so have no need of the crazing mills for their best stuffe, but only for the crust of their tayles."

The process of concentration was carried on by means of riffing the crushings over green turfs, three or four feet square and one foot thick. The concentrate was put into a wooden dish, broad, flat, and round, "being about two foote over, and having two handles fastened at the sides, by which they softly shogge the same to and fro in the water betweene their legges, as they sit over it, until whatsoever of the earthie substance that was yet left, be flitted away." But mark again the march of progress. "Some of later time, with a sleighter invention, and lighter labour, doe cause certaine boyes to stir it up and downe with their feete, which worketh the same effect."

Each partner in the venture then carried his portion to the 'blowing house', where it was melted and cast into "peecees of a long and thicke squareness, from three hundred to foure hundred pound weight, at which time the owners mark is set thereupon." Once again Carew marvels wherein can lie the profit in going to such extraordinary pains—two or three months of extreme and increasing labor, numberless dangers and vicissitudes, and, last, but not in his opinion least, the "tynnners" ugly countenances, tanned "with smoake, and besmeared with sweate."

The melting was done in lightly constructed thatched buildings. Once in seven or eight years these were burned down to recover the mechanically lost tin.

After reference to "coynage", the account concludes with allusion to the bargaining between metal-buyers and sellers. The former brought long tales of bad markets, idle stocks, dangers of piracy by sea, rumors of war, and so on, in their efforts to depress prices. "The owner, on the other side, stoppeth his eares against these charmes," and grows eloquent on the scarcity of tin and the waxing expense of winning it.

It is impossible to reproduce the charm of Carew's volume. Part of it lies in the quaint and uncertain spelling, part in the diction, which is tinged throughout with Cornish idiom despite the author's Oxford erudition. But mostly it consists in remarkable keenness of observation and frankness of expression, together with a gift for moralizing that is typical of the spacious times in which Richard Carew, Esquire, of Antonie, in the Duchy of Cornwall, lived, moved, and had his being.

The Deepest Well

During the last few years the Hope Natural Gas Co. and the People's Natural Gas Co., both of Pittsburgh, Pennsylvania, have been drilling deep wells in northern West Virginia and south-western Pennsylvania to find deeper oil-bearing and gas-bearing sands, their object being to reach, if possible, the horizon of the rich Clinton sand of Ohio, which, according to I. C. White, the State Geologist of West Virginia, should be found in this region at depths between 7000 and 8000 feet.

The first exceptionally deep well thus drilled, the R. A. Geary well, of the People's Natural Gas Co., is about four miles north-west of McDonald, Pennsylvania, and about 20 miles south-west of Pittsburgh. The mouth of the well is 1050 ft. above sea-level. It penetrates the Gordon stray sand, the last of the usual gas-sands in this region, at a depth of 1971 ft. From this point to a depth of 6700 ft. the strata penetrated are alternately lime and slate, and from 6700 ft. to the bottom, 7248 ft., they are sand and lime interspersed with about 60 ft. of rock-salt. The second deep well was drilled by the Hope Natural Gas Co. on the farm of M. O. Goff, about eight miles north-east of Clarksburg, in northern West Virginia. Its mouth is 1164 ft. above sea-level. The well begins 200 ft. below the level of the Pittsburgh coal and penetrates the usual oil-bearing and gas-bearing sands, the lowest being the Bayard, which lies at a depth of 2210 ft. The strata in the remainder of the well are alternately lime and slate. The third deep well, the J. H. Lake, of the Hope Natural Gas Co., is about eight miles south-east of Fairmont, West Virginia. It is about 20 miles north of the Goff well and about 60 miles south of the Geary well. The mouth of the well is 1300 ft. above sea-level. The Bayard sand, the lowest of the gas-sands, was found in this well at a depth of 2050 ft. The remaining strata are alternately lime, slate, and sand.

Named in order of depth, the four deepest wells in the world are the Lake, 7579 ft.; the Goff, 7386; a well at Czuchow, Germany, 7348, and the Geary, 7248 ft. The two deepest wells in the world are therefore the Lake and the Goff, the Lake surpassing the German well by the large margin of 231 ft. In comparison with these great depths, other depths reached by wells or mines sunk in the crust of the earth are rather insignificant. The deepest mine in the world is shaft No. 3 Tamarack, in Houghton county, Michigan, which has reached a depth of 5200 ft. Other shafts of the Tamarack Co. and of the Calumet and Hecla mine, in the Lake Superior region, reach depths between 4000 and 5000 ft. Three shafts in the Przibram silver mines in Austria have reached depths of about 3300 ft. The Victoria quartz mine, at Bendigo, Australia, is 4300 ft. deep. A number of shafts in the Transvaal gold region of South Africa have been sunk to depths of about 4000 feet.

The depth to which a mining shaft can be sunk is limited by the heat of the rocks, as the temperature at a depth of a mile in nearly all parts of the earth is so high

that workmen cannot live in it, even with ventilation. The depth to which a well six inches in diameter can be drilled seems to depend on skill in drilling and strength of cable. The cable itself is heavy, and besides carrying its own weight and the weight of a drill, which weighs 1 or 2 tons, it must bear strains produced by vertical movements of the drill, which may be so great as to break it at any moment, so that the drill and a part of the cable may be lodged in the well in such a way that they cannot be removed. Exceptional skill is required, therefore, in operating the ponderous machinery used in drilling a well. The drill, which is a column of steel about five inches in diameter and forty or fifty feet long, beveled to a V-shaped edge at the lower end, is attached to one end of the cable, and at some other point, determined by a driller, the cable is attached to a long beam, which is operated in the same manner as the walking-beam of a steamboat. Merely to lift the drill through the height determined by the swing of the end of the walking-beam and to let it drop repeatedly would do no drilling. In order to drill, oscillations must be induced in the cable; such as those set up by attaching a light weight to a suspended rubber band. A slight oscillation properly induced by the finger at the upper end of the rubber band will produce a very large oscillation of the weight attached to its lower end. In some such way as this the skilful driller produces oscillations in the drill-bit, which throw the sharp beveled edge of the drill onto the rock with high velocity. The only means that the driller has of knowing the behavior of the drill is the general behavior of the machinery and the slight impulses or tremors in the cable, which he detects by his hand alone.

The materials and the conditions in the interior of the earth have long been a favorite subject of speculation among scientific men. According to the modern mathematical theory of the propagation of earthquake waves through the earth the outer rocky shell of the earth, which is about two and one-half times as heavy as water, extends to a depth of less than 1000 miles. Inside this shell is some material, probably metallic, which is more than five times as heavy as water. Estimates of the temperature at the centre of this nucleus range from 3000° to 180,000°F., but these figures have little or no value, for mathematicians have not yet found the law of the distribution of temperature from the surface to the centre of the earth. The temperature evidently increases with the depth, a fact again confirmed by an elaborate series of observations of temperature made in each of the three deep wells, the Geary, the Goff, and the Lake, by C. E. Van Ostrand of the Geological Survey. In each of these wells the temperature at a depth of 100 ft. is about 55°F., and gradually rises with increase in depth, reaching 142° in the Geary well at a depth of 6100 ft., 159.3° in the Goff well at a depth of 7310 ft., and 168.6° in the Lake well at a depth of 7500 ft. The observation at a depth of 7500 ft. in the Lake well was made at the deepest point yet reached by any observer.

The source of the enormous quantity of heat stored in the interior of the earth is not known. Some writers

think this heat is due to the disintegration of radium in the rocks, others think that the earth is a cooling globe, radiating heat developed during condensation from the original nebula, and others think that it is due to various causes, such as radio-activity, chemical reactions, impacts from meteorites, or condensation from nebulous material.

The strata of lime, slate, and sand penetrated by these deep wells were originally sediments deposited from ocean water. A bed of ocean water was actually found in the Geary well at a depth of 6260 ft. Dr. White is of the opinion that this water is a fossil ocean, imprisoned since mid-Paleozoic time. Interesting evidence in regard to the geologic history of the formations was obtained by Charles Butts of the Geological Survey, who identified a number of fossils from depths of 7187 to 7355 ft. in the Goff well. The material from the Lake well has not yet been fully examined. It may be possible by examining the fossils to determine the geologic ages and horizons of the beds penetrated, and so to estimate the depth at which the Clinton sand should lie beneath the bottom of this well. The well probably does not pass through more than one-half the total thickness of sediments in this region.

Mining in California in 1919

The outstanding feature of metal-mining in California during the first half of 1919 is the closing down or the restriction of the operations of some of the principal productive deep mines. A number of mines, according to C. G. Yale, of the U. S. Geological Survey, have been closed by labor strikes; others by the low prices of the metals produced, the high cost of labor and supplies, the scarcity of skilled labor, and high taxes and other war conditions. Moreover, for the last few years there has been a manifest disinclination to invest capital in metal-mining, especially in the older centres of the industry. The copper and lead mines have been most affected by these conditions, but the larger deep gold mines have also had their troubles. The gravel mines, especially the dredging properties, have not been so seriously affected as the quartz mines, yet their costs have greatly increased and they have had difficulty in obtaining sufficient competent labor. The war surcharge cost for electric power has been the greatest burden borne by the gold dredgers, who assert that the voltage has gone down while the rates have gone up.

During the first six months of 1919, the United States Mint and the local smelters and refiners, to which most of the newly mined gold in California is sent, received from the mines in the State \$390,573 less gold and \$24,511 less silver than during the first six months of 1918, but as the annual output of gold is now \$17,000,000 to \$20,000,000 this difference in the output during the first half of the two years is insignificant. In 1918 there was a falling off in the production of gold, compared with 1917, of over \$3,500,000, but the small loss in the first half of 1919 compared with that in the first half of 1918 shows that the decline in output has been materially

checked and that under normal conditions the output of gold in the State will take the up-grade. In this connection it should be noted that the reduction in the quantity of gold produced may be attributed to a decrease in the output of the larger mines. The number of producing mines in the State has increased during the last year or year and a half, but the increase in number is really among the smaller mines, especially the deep or quartz mines, which after a few years of idleness are now being re-opened.

The Mammoth plant of the United States Smelting & Refining Co., the most productive mine in California, all metals considered, ceased operations on May 15, because of labor trouble. The closing of the smelter stopped work at a number of mines, which had been shipping ore to it, including the Afterthought mine. The Penn Mining Co., mining copper in Calaveras county, ceased operations, and the output of the Calaveras Copper Co. was curtailed. A number of copper properties in other counties also stopped work, owing to the low price of the metal and the scarcity of labor. The most productive lead and zinc mine in the State, the Cerro Gordo, in Inyo county, also closed down because of labor trouble. A fire in the Argonaut mine, Jackson, Amador county, the most productive of the Mother Lode mines, stopped work there for two months, but operations were resumed on June 1. Fumes from the fire hampered work in the adjoining Kennedy mine, another large producer. A miners' strike at Grass Valley, Nevada county, the region including the most productive deep gold mines of California, curtailed for a time the gold output of the North Star and other large properties. The larger mines have reduced their working force and will not be able to operate to advantage for some time. The lower levels will have to be pumped out.

It is pleasant to note renewed activity at the gravel mines, particularly at the hydraulic and drift mines. In Trinity and Siskiyou counties a large number of mines that have been more or less idle have given good accounts of themselves this year, when an abundance of water was available. Some of the townsites—old historic places like St. Louis, Sierra county—are being hydraulicked; the towns having been abandoned. In the same region hydraulic mining on a large scale is contemplated also at Howland Flat, Port Wine, La Porte, and other mining camps whose history can be traced back to 1849. Work at numerous silver-lead properties in Inyo and San Bernardino counties has been started within the last six months. Some of these are old mines, which have been idle for 20 years or more. Rich silver ores have recently been discovered near Randsburg, in Kern county, and their discovery has stimulated active prospecting throughout that region. The deposits are being mined with local capital.

No. 121 of the technological papers of the Bureau of Standards has just been issued. This pamphlet sets forth the results of tests and experiments made to determine the strength and other properties of wire-rope.

REVIEW OF MINING

COLORADO

GENERAL NEWS OF THE SILVERTON DISTRICT.

SILVERTON.—Production from the district is not very heavy, although a large amount of development work is under way. The rising price of copper will be an incentive to many of the smaller operators of the district to ship, but the present price of lead, on the other hand, does not encourage some of the operators to continue. The Gold King Extension Mines Co., after a successful mill run of several weeks, closed down to make some changes in the method of treatment. It is expected that operations will be resumed at an early date. The Iowa-Tiger Mining Co. has a force of men engaged in raising to connect the 200-ft. and the 400-ft. levels, in order to improve ventilation. After a few weeks, during which the entire force was engaged upon development work, shipment was resumed. A profitable vein of high-grade lead ore is now being worked. Construction work on the Sunnyside company's boarding and bunk houses continues and is progressing rapidly. A tailing dump is being worked over and a good recovery of zinc and other metals being made. The prospective plan for a unit of the Associated Mines, Smelting & Reduction Co. is receiving support from a number of mining men of the district. The plans call for a 25-ton mill at a cost of \$25,000. The process of this company provides for the recovery of the metals and the by-products that are generally lost in smelting operations, through a chemical separation at a relatively low cost. Should the project prove feasible, it would afford an outlet for the extensive bodies of low-grade ore as well as the large dumps of this district. The rise in copper is encouraging many producers of this district operating upon copper ores to continue. Among the leading shippers affected by the favorable copper market are the Dora Con. company, operating through lessees, the Champion Leasing Co., operating the various levels of the Champion through lessees, and the Anvil Leasing Co., at the present time developing the Emerald Lode. The Garfield Smelting Co. has leased the Silver Lake property to J. B. Giono & Co., which is getting out ore from the main workings. No. 4 level is being operated by a force of sub-lessees. The Tip Top Leasing Co. ceased operations after working over one of the dumps of the property. Among the properties to be reopened, after lying idle for many years, are the Idaho, and the Tom Moore. The Empire State Mining & Reduction Co. is to build a mill, and no further mining operations will be carried on until it is completed. It is reported that there is a large body of good

milling ore blocked out. The Mayflower Leasing Co. continues to develop its property. Heavy shipments are being made of high-grade silver concentrates. The Highland Mary Leasing Co. has sub-leased sections of the mine to various local men, and the workings are being developed extensively. It is reported that a five-foot vein of high-grade silver ore has been cut, and the outlook is favorable for heavy and continuous shipping. The Dives

SILVERTON DISTRICT, COLORADO

Leasing Co. is developing its properties extensively, and shipping in large quantities. A good vein of high-grade silver ore has been intersected. A force of 30 men is now employed, which will be increased as men are available.

NEVADA

GOLDFIELD.—THE ATLANTA MINE.—GEOLOGY OF THE SIMON DISTRICT.

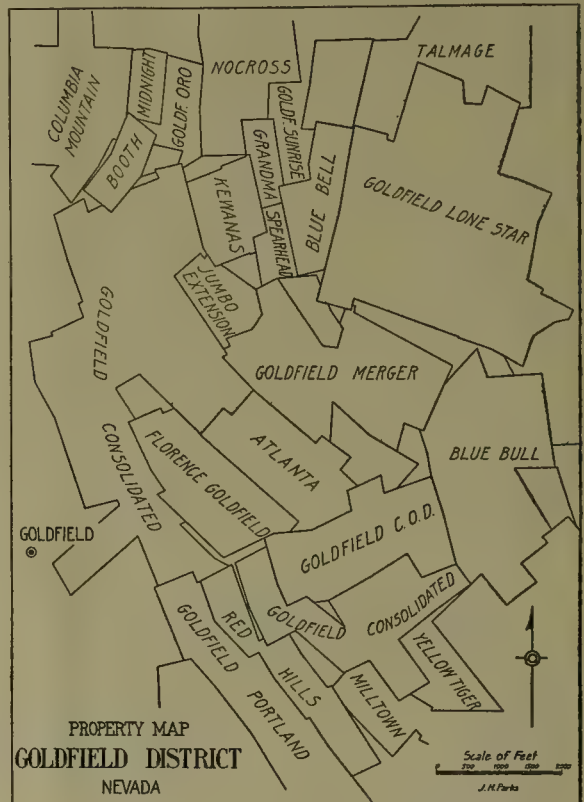

GOLDFIELD.—Mine and mill repair work has been almost stopped by the Goldfield Development Co. pending settlement of the Tonopah-Divide strike. Practically all the 125 men employed were discharged because it was feared a prolonged suspension of operations in the two

silver districts would result in financial trouble that would deplete the cash reserves of the company. The activities of labor agitators from Tonopah and Divide also was a large factor in the decision to practically suspend operations. The Florence, the only other company in the district employing a large force of men, is operating to capacity. J. B. Kendall, former manager of the Goldfield Consolidated and now manager of the Mayflower at Pioneer, has taken a lease on the Florence extending from 200 ft. north of the old Daisy lease shaft to the northern boundary of the Cornishman claim. Kendall will work through the seventh, or 358-ft. level, of the main Florence shaft in an attempt to open the intersection of the Florence-Consolidated vein and an important spur from the Jumbo vein. The Florence Divide lease on August 30 started loading the sixth car of ore since the 'high-grade' shipment.

The lower levels of the Atlanta have been abandoned following a fight with water that lasted nearly two months, and the 1800-ft. shaft of the Merger Mines Co., through which the Atlanta was working, will no longer be used in the operations of either company. The Merger shaft is the deepest in southern Nevada. Future work of the Atlanta will be from the 1465-ft. level of the Grizzly Bear shaft. Since March 14 all work in the Merger has been done through the Spearhead shaft. The reason for abandoning the lower levels was that the pumps, after years of service, were no longer capable of handling the heavy flow of water in the winze from the 1750-ft. level, through which all work was done at a depth of 1900 ft., and the cost of new machinery was considered too great. Removal of the Clermont head-frame for use at the main Development company shaft largely was responsible for recent rapid destruction of the pumps, as this permitted water containing a large percentage of sulphuric acid to flow into the Grizzly Bear shaft, from the 1465-ft. level of which the water from the Atlanta was pumped to the surface. A new head-frame has been erected at the Clermont shaft after long delay due to a shortage of suitable timber, but this was not completed and bailing resumed until the Grizzly Bear pumps had been damaged and those at the top of the winze practically put out of commission. The main winze is 1000 ft. from the Merger shaft. The water was pumped from the top of this to the shaft and from there to the 1325-ft. level of the Merger, from where it went by gravity to the 1465-ft. level of the Grizzly Bear to be pumped to the surface in one lift. Miners had not been able to reach the bottom of the winze for a month before work was abandoned. Operations to open the Atlanta vein from this winze were slow and costly. Driving in an eight-foot shoot of low-grade ore was well under way when work was stopped.

SIMON DISTRICT.—J. K. Turner, consulting engineer of Goldfield, recently visited the Simon district to inspect the newly erected surface equipment of the Simon Mina company, of which he is president. The shaft is now 40 ft. deep and sinking will be continued to 200 ft. before a cross-cut is driven to the vein. The Simon Mina owns

five claims one mile south of the shaft of the Simon Silver-Lead company and adjoining on the east the Simon Junior. The shaft is being sunk in the same vein in which the Simon Silver-Lead orebody was opened. Other companies sinking in this vein are the Consolidated West Extension, Thompson-Walsh, Silver Top, Norman and Simon Fagan, the last two having opened ore. According to Mr. Turner, the surface conditions are similar on the claims owned by all of these companies and it is his opinion that the same general character of ore as in the Simon Silver-Lead will be found at from 250 to 400 ft. In the Simon Silver-Lead the ore is found as a contact replacement. The shoot has a width of from 25

to 50 ft. to the 200-ft. level, is 77 ft. wide on the 300-ft. level and 140 ft. wide on the 400-ft. level. The length of the shoot has not been determined. On the 300-ft. level it has been opened for 300 ft. The average content of the sulphide ore below the 300-ft. level is 8 oz. silver, 9% lead, 10% zinc, and from \$1 to \$3 in gold. An experimental plant for testing methods for reducing the ore is in operation at the mine.

The Simon district is in the northern part of the Cedar mountains, in Mineral and Esmeralda counties. The range is 25 miles long and rises from surrounding lake beds. The elevation is from 6000 to over 8000 ft. The district is on the west slope of the range. In a report issued on the geology of the Simon district, Mr. Turner says: "The core of the mountains is a granitic rock. The flanks are composed of Juro-Triassic lime-

stones and schistose rocks, Tertiary volcanic lake beds. The limestones and schistose rocks (shales and slates) are uplifted, intruded, folded, fissured, and fractured by igneous rocks (granites, grano-diorites, and diabase) and partly covered toward the north end of the range by flows and intrusions of Tertiary volcanics (rhyolites, andesites, and basalt). The mineralization of the Simon district is extensive and outcrops of gold, copper, and lead ores are frequent. Oxidation and the action of surface water have greatly leached or altered the surface of the veins to such an extent that little of the metallic content remains, necessitating sinking to the unleached part, which is usually found at from 250 to 400 ft. Contact veins are frequent and the silver-lead veins largely follow the contacts between limestone and the intrusive igneous rocks. Many cross-fissures radiate from the contacts, containing good ore. The mineralized area extends far into the limestone."

WISCONSIN

PLANT OF THE NATIONAL ZINC SEPARATING CO.

CUBA CITY.—The National Zinc Separating Co. has a capacity of 275 tons of crude zinc concentrate per 24 hours. The plant uses a Wedge furnace and treats a variously composed ore running from about 23 to 46% zinc. The ore supply comes mainly from a string of producers operated by the Vinegar Hill Zinc Co., supplemented by purchases made in the open market from nearby low-grade producers. The ore is introduced into bins and distributed into a Wedge furnace which has seven roasting hearths and a top drying hearth, 22 ft. 6 in. diameter and 24 ft. above the floor. The roasted ore is discharged from the lowest hearth into two rotary coolers. No outside fuel is necessary in roasting the ore. The dust-laden gases, passing out through the side of the furnace from the first hearth, are first led into a dust-chamber, then through a Cottrell precipitator, and are then discharged to the air through a stack 6 ft. in diameter and 170 ft. high. The Cottrell precipitator consists of two units which are so arranged that either unit may be operated alone or in parallel with the other. At present each unit is operated separately and alternately for periods of about two weeks. From the Wedge furnace the ore passes through four rotary drums water cooled by means of a spray directly above them. The temperature is reduced appreciably but the ore is far from cold when it reaches the magnetic separators. Two types of Dings separator are employed, the M. M. rougher and the H. I. machine. The ore as delivered to the finishing machine will average 56 to 58% Zn and 3 to 4 % Fe. The finisher magnetic separator is made by the Dings Electro-Magnetic Separator Co. of Milwaukee. In its final stages the ore is brought up to premium grade, frequently assaying as high as 63% zinc. The power is furnished by the Interstate Light & Power Co. of Galena, Illinois, fourteen miles from Cuba City. It is transmitted to the National plant from the Cuba City sub-station and from there is transformed to 220 volts. The power consumption per 24 hours required for the treat-

ment of 125 tons of ore per day amounts to 2950 kilowatt-hours. The total cost of green ore roasted based on a tonnage of 125 tons per 24 hours is about \$3 per ton. The advisability of a thorough cleaning of concentrates is evident in a field where the zinc-blende occurs intimately associated with iron sulphide in the form of marcasite. With the ordinary methods of concentration obtaining in the Wisconsin field it is impossible to obtain a clean concentration. In fact so irregular do the assays appear that it may be stated that no two mines in the field show the same concentrate assay. Making a high-grade concentrate affords two distinct advantages; first, a marketable commodity commanding a higher price; second, a reduction of freight rates by the elimination of non-essential material.

Most of the roasting and magnetic separating conducted in the Wisconsin zinc-lead camps is done by three companies: the Mineral Point Zinc Co. at Mineral Point, National Separators at Cuba City, and Wisconsin Zinc Co. at New Diggings. There are, however, other and smaller concerns engaged in roasting ores. The Linden Zinc Co. has a small plant at Cuba City; the Block-House Mining Co. has installed an independent unit at Platteville in connection with its surface rig; and there are independent plants at Benton and Linden, both of which have been idle for two years. The Galena-Joplin plant at Galena, Illinois, resumed active work recently after a protracted period of idleness, but its capacity is limited. A return to normal conditions throughout the country, accompanied by a more stable condition in zinc mining, will no doubt witness greater development of the separating branch of zinc concentration.

BRITISH COLUMBIA

CARIBOO DISTRICT.—GENERAL NEWS.—A NEW DEVELOPMENT SYNDICATE.

Monthly returns of the gold bullion received at the Dominion Government Assay Office at Vancouver indicate that the output of British Columbia and the Yukon this year is not likely to exceed greatly that of the last twelve months, although an encouraging upward tendency in production is noted. A substantial increase is predicted in 1920 when new properties such as those being developed on Sheep creek begin shipping, when placer ground which has been dormant during the War is made productive, and when the dredging companies, several of which are commencing operations in the Cariboo, are operating. The value of gold bullion received at the Vancouver office from British Columbia last year was \$2,178,078 and from the Yukon territory, \$1,921,197. This, of course, does not represent all the gold produced by these parts of Canada.

Honorable William Sloan, Minister of Mines, has just returned after a trip through the Cariboo district. The object of his tour was to discuss with the miners and prospectors the question of dredging and placer licenses, to the end that the Government might ascertain what is necessary to encourage the opening of that region. Mr. Sloan is of the opinion that large areas that have been

held for many years without development should be made productive. He found much interest manifested in gold mining throughout the district and believes that although the output recently has not been so large as in the past it will increase in the future. With the Pacific Great Eastern Railway, which now is being constructed through the Cariboo to Fort George, and which eventually will tap the great Peace River country, furnishing transportation facilities, operators will be able to place heavy mining machinery on their property. The Minister of Mines pointed to the fact that men with large experience at dredging operations in the Yukon are going into the Cariboo and investing heavily, and considered that as being encouraging to the latter district. An instance was that of James Moore, one of the large

Boundary districts. The New Era Mining Co., of Vancouver, proposes placing the old Beatrice mine, near Camborne, on the shipping list. This property was shut down some years ago because of the low price of silver. It is on the summit of Lexington mountain, near the headwaters of Mohawk creek. The Gold Bug-Rambler mine is reported to be showing up well under development. A discovery just announced is described as consisting of 25 ft. of concentrating ore with 18 in. of clean ore on the wall, running high in silver with 55 to 60% lead and some gray copper. The property is on the south fork of Lardeau creek, seven miles from Trout Lake City. Some fine samples of clean galena have been taken from the Tenderfoot group on Tenderfoot creek. There are three parallel veins on this property which

YALE, B. C.

operators of the Yukon, who is placing a dredge on Antler creek. His associates have secured a large tract with promising placer grounds on the Swift and Little Swift rivers, and preliminary investigations have so satisfied them that they have arranged to install a large dipper dredge. Mr. Sloan also spoke of the activity of the Dominion government in conducting a geological and topographical survey covering 16 square miles of that section. This work is centred at Harpers Camp where there is some promising ground. At present the International Dredging Co. has a machine operating with good results. At the junction of the North and South forks of Horsey river a drag-line scraper is being put in by Victoria mining people and the experiment is being watched with interest.

LARDEAU.—The same evidence of revival in mining is found in the Lardeau district as in the Kootenay and

have been developed by about 200 ft. of tunnels, the greatest depth being about 50 feet.

ROSSLAND.—Residents of Rossland are confident that the large concentrator which the Canadian Consolidated Mining & Smelting Co. will provide for the treatment of the ores of the Rossland district will be placed in that city rather than at Trail. Surveys now are in progress and investigation under way as to the water supply. It is thought that no difficulty will be experienced in meeting the requirement in respect to the latter. In the meantime Rossland, once the busiest mining centre of the Province but recently suffering through the comparative inactivity of the mines on which the community chiefly depends, has taken on a new lease of life and is looking confidently to the future.

KIMBERLEY.—A forest fire swept away most of the equipment of the North Star mine, a well-known silver-

lead property which has been producing for some time. The tram line, some buildings, and necessary plant were destroyed. This is being replaced as rapidly as the material can be secured and the mine will be shipping again in a few weeks.

SLOCAN CITY.—The Evening Star and Silver Nugget mines, which have been dormant for years, are to be operated again. William Moore, owner of the California mine, is supervising the work. Cars, rails, and other mining supplies have been forwarded through Nelson. The Evening Star is situated on Dayton creek about seven miles from Slocan City. Considerable development has been done on the property and plans have been decided upon for continuing it. The Silver Nugget is situated about six miles from Silverton. This also has been opened up to the extent of driving two tunnels. A shipment of ore from the Evening Star two years ago ran 347 oz. of silver and \$23 in gold per ton, and in 1894 a shipment from the Silver Nugget gave a return of \$208 per ton, silver then being 57 cents.

VANCOUVER.—An organization known as the Vancouver Mining Development Syndicate has been launched with a capitalization of half a million dollars and \$100,000 capital subscribed. The object of this Syndicate is to bring mining prospects of British Columbia to the attention of the investing public. The idea is that in the event of a prospector locating a promising property which he lacks means of developing he can go to the Syndicate for assistance. The latter then will send a competent engineer to report and, if the report is favorable, the prospector will be given financial aid. Should the proposition look as well on development as it originally promised it will be placed on the market, a portion of what is realized to go to the discoverer and a portion to the Syndicate. Nicol Thompson, A. M. Whiteside, J. H. Greer, A. H. Wallbridge, and A. Erskine Smith are members of the board of the new organization. They are businessmen of the city of Vancouver.

ONTARIO

THE STRIKE SITUATION.—RECENT DEVELOPMENTS IN THE PROVINCE.

Mining operations in the Kirkland Lake and Cobalt camps remain completely suspended owing to the strike, which shows no signs of reaching a settlement. At Cobalt during the past week there was a strong attempt made by a committee of returned soldiers employed in the mines to bring about an understanding between the parties but without result, as neither the managers nor the strikers appeared disposed to make concessions. At last accounts the situation had reached a deadlock, the managers insisting on the men returning to work before any settlement of the questions at issue was considered, and the union leaders expressing their determination to continue the fight until spring if necessary.

PORCUPINE.—Official figures for the first 24 weeks of the current year show that the Hollinger Consolidated treated 316,386 tons of ore, with a total output of

\$3,166,625, a yield per ton of \$9.93. The cost per ton was \$5.20, and the total cost \$1,646,868, leaving a profit of \$1,519,756. The mill ran 69% of the possible running time. The company is now in a position to resume dividend payments at the former rate of 1% every four weeks, as soon as the directors consider it advisable. At the Dome Mines the mill has lately been treating ore at the rate of about 600 tons daily, the average grade of the ore being about \$9 per ton. The cost of operating is understood to be in the neighborhood of \$4.50. As the milling capacity is increased and the cost somewhat lessened by the treatment of a larger tonnage, the mill-heads will gradually be reduced. A resumption of dividend payments is looked for at the beginning of next year. Preliminary development on the Sovereign properties has exposed several good veins, one of which yields high assays. A shaft has been sunk 60 ft. in ore averaging \$9 per ton and 5000 ft. of trenching has been done. At the Clifton driving on the Boulder vein has now extended upward of 100 ft. in ore showing visible gold. Complete assay returns for the first 30 ft. give an average of \$30 per ton over a width of five feet.

LARDER LAKE.—The Associated Gold Fields cross-cutting on the Reddick property has cut a wide body of ore, which is believed to be a continuation of the extensive deposit on the Kerr-Addison. On the last it was 1200 ft. long and the new find may lengthen it to 2000 ft. The Crown Reserve has purchased two claims of a group owned by N. N. Maloof of Haileybury, situated a short distance north-east of the Harris-Maxwell. The purchase price is reported to be high. A recently published report by Percy E. Hopkins of the Ontario Bureau of Mines on the Larder Lake area expresses the opinion that "since the known richer shoots are small and scattered, the success of mining will depend upon the mining of extremely large bodies of low-grade ore, which will necessitate much capital and very detailed mining." This conclusion has excited much unfavorable comment on the part of mining men and prospectors, who accuse the Government geologists of knocking the area, and state that drilling to the depth of 700 ft. has shown high-grade ore.

MATACHEWAN.—At the Matatchewan (formerly the Otisse) lateral work is being carried on at the 170-ft. level and cross-cutting is also under way. Active development will be continued until winter, when an estimate can be made of the additional mining equipment required. On the Nelson claims several miles north of the centre of activity, surface outcrops show veins or mineralized dikes carrying gold contents. Test-pits are being sunk.

WEST SHINING TREE.—There is much activity in this camp and a large amount of diamond-drill work is being undertaken. The shaft at the Wasapika is down 100 ft., and the cross-cut at 15 ft. is all in ore with visible gold showing throughout. A shaft is going down on the West Tree with visible gold across its full width. At the Atlas three test-pits on the Evelyn vein show much free gold and a working shaft is being sunk.

SUSPENSION OF ASSESSMENT WORK

We have received many inquiries about the bill for suspending annual assessment work, the text of which was published in our issue of August 23. Owners of mining claims seem uncertain whether the report of the passage of the bill was official. We have just received a bulletin of the California State Mining Bureau, stating that this bill became a law on August 15.

CALIFORNIA

Allegheny.—There is a rumor current here that the famous Tightner mine is to be sold to a party of New York capitalists. It is understood that the price is more than \$2000 per share, which would make the purchase price in the vicinity of a quarter of a million dollars.

Grass Valley.—The hoist at the Union Hill mine is being dismantled and will be erected on the old shaft of the Idaho-Maryland mine. It is stated the Union Hill will be later worked through a central shaft that the Idaho-Maryland plans to sink to facilitate economical operation of the combined properties.——Re-opening the Central Consolidated is proceeding under management of John Nichol. This property was closed at the outbreak of the War and has been idle ever since. Some difficulty is being experienced in securing miners. Dewatering of the shaft is in progress. The company is controlled largely by Honolulu capital.

Heroult.—The Noble Electric Steel Co. is shipping a car-load of iron ore weekly to San Francisco foundries, where it is converted into pigs by the open-hearth process. Development of the deposit is proceeding, but no attempt is made to operate the electric steel smelter.

Igo.—A temporary injunction issued from the Superior Court restrains C. C. McDonald, V. V. Apperson, and S. Jamerson from shipping ore they have extracted from the South Fork mines until after the suit brought by Mrs. Mary Ballou is tried. Mrs. Ballou claims that the South Fork mines are hers.

Ingot.—The Afterthought Copper Co.'s new reverberatory furnace is in operation, and the oil-flotation plant will be started soon. The company has been having trouble obtaining a full crew of men.

Knob.—The Gibson mills are running on ore from the Midas and Bull Moose mines, controlled by the Victor Power & Development Co. Development of the Bull Moose has uncovered high-grade gold ore and a fair tonnage is exposed.

La Porte.—Prospecting old river channels nine miles north of La Porte is being carried on by three companies by means of Keystone drills. It is reported results have been encouraging, and long-sought deposits have been found. The South Fork Gold & Travel Co. reports that a channel 1500 ft. wide has been indicated by the drills, and preparations are being made for mining. Robert Edgar is superintendent. Head offices are at Lindsay, California.

Lewiston.—The Bablew hydraulic mine has closed down for the season, on account of a shortage of water.

Nevada County.—The Golden Center mine will close

temporarily about September 1, because of a heavy flow of water that flooded the present pumping plant. A heavier plant will be installed.

Sierra City.—The Hilda Gold Mining Co., the Yuba River Mining Co., and the Primrose Gold Mining Co. have recently been re-financed by C. P. Doelger, A. B. Matzene, L. J. Baumer, and several other prominent business men of New York. The several channel claims on the Yuba river belonging to the first two companies and the promising 12-ft. quartz vein of the Primrose mine will be fully developed. Recent work on the Primrose shows an excellent vein running \$15 per ton. Samuel H. Dolbear has been appointed general superintendent of all operations, and J. R. Evans, superintendent of the Primrose property.

Sierra County.—The U. S. District Court at San Francisco last week denied the injunction asked for by the Twenty One Mining Co. against the Sixteen to One Mining Co. involving vein rights to valuable mining ground at Alleghany. It was stipulated that the question at issue should go to the Supreme Court at Washington for final determination.——H. J. Sheafe, field geologist for the War Minerals Relief Commission, is making examinations and reporting on the chrome ore mined last year in connection with the claims of several applicants. Later he will pass upon deposits mined in Nevada county.

COLORADO

Cripple Creek.—Good ore at depth has again been intersected on the Lee 5 vein of the Portland company on Battle mountain. Driving south on the vein at the Roosevelt Tunnel level, 2131 ft. below the collar of No. 2 shaft, a rich shoot was cut, the ore breaking from four to five feet wide, with a core from one to three inches of sylvanite. The Portland shaft has been sunk 150 ft. below the tunnel level, a total depth from surface of approximately 3000 ft. A station is now being cut at this depth.——The El Paso Extension Gold Mining Co., having acquired control of the Lexington Gold Mining Co., will install machinery at the Clara D shaft on Gold hill. An electric hoist is planned for the Jeff Davis if lessees are secured for that property. Lessees on the Clara D are mining and shipping a good milling grade of ore. The dump has also been leased.——The Forest Queen Mines Co., operating the Forest Queen on Ironclad hill, has resumed production. A car of between \$30 and \$40 ore was consigned to the Golden Cycle mill last week.——Operations will be resumed by lessees on the Mary Cashen Mining Co.'s property at Victor, on or about September 1.——The property adjoining the Strong mine and Portland and Granite companies' estates has been closed down for a long period. The mine has produced a fair tonnage of low-grade ores, which, under the lower treatment rate now obtaining, may be mined at profit.——Reports from the Cresson mine are to the effect that the August production will show an increase. The directors of the company will soon meet in Colorado Springs, when it is expected the monthly dividend of 10c. per share, a total of \$122,000, will be declared.——The Golden Cycle Mining & Reduction Co. will pay on September 10 the regular monthly dividend of three cents per share, a total of \$45,000, to stockholders of record of August 31.

IDAHO

Coeur d'Alene.—Electricity will be used to operate a compressor which the Sterling Silver Mountain Mining & Milling Co. plans to install for the development of its property on Big creek. New buildings for machinery and men will be erected. One vein on this property has a width of 20 ft. on the surface. A lower cross-cut tunnel is expected to reach this vein at a distance of 500 ft. and a depth of 500 ft. A second vein lies beyond.—A carload of ore, the first taken from the shoot struck recently on the 500-ft. level, has been shipped by the Richmond Mining, Milling & Reduction Co. It contained 40 tons and included chunks of sulphide ore having an estimated content of 30 to 35%. Shipments will be made more frequently when the stope has been opened sufficiently for production.—Adjustment is proceeding at the concentrating mill of the Nabob Consolidated Mining Co., on Pine creek. Ore is being dressed in the period of adjustment and concentrate is being produced, although in less volume than anticipated when the adjustment has been completed. The tonnage available for milling is being increased daily.

Mullan.—The Copper King Mining & Smelting Co. has cut a vein 50 ft. wide on its tunnel level. The vein so far as it has been explored does not contain ore in commercial quantities, but galena and bunches of lead are found at intervals.

Southern Idaho.—F. A. Thomson, dean of the school of mines in the University of Idaho, has concluded a tour of all the mining districts in southern Idaho. "Interest in mining is being re-awakened in southern Idaho," says Professor Thomson. "The Delamar and Trade Dollar mines have been re-opened, and there is much activity in districts that have been quiet for a long time."

Ten Mile.—Recent development at the property of the Summit Flat Mining company has given encouraging results. A vein 35 ft. wide has been intersected by a cross-cut tunnel at a point 1100 ft. from the portal and at a depth of 225 ft. Drifts have been driven for short distances in both directions on the vein, disclosing an orebody of good size. Sampling encourages belief that at least \$20 in gold and silver to the ton may be expected from parts of the vein having a total width of 10 ft. Operations are in progress on 11 properties in the field, according to a letter from Ralston McCraig, secretary-treasurer, who is directing operations on the Summit Flat. The properties are the New York, McKay, South Fork, Buckhorn, International, Mineral Zone, Gilt Edge, Una, Homestake, Frank Peck, and Black Pine.

MICHIGAN

Houghton.—The Calumet & Hecla reclamation plant at Lake Linden now is recovering more copper than at any time in its history and is making a larger gross profit per ton of material handled than any mine operated by the Calumet & Hecla.—The additional flotation plant will be ready to operate September 1. It has a number of alterations intended to bring about greater economy in operation, the result of the lessons learned in the operation of the original plant.—The first cargo of Belgian flint bricks has arrived and the Hardinge regrinding mills now are being lined with them. The conclusion of peace makes the importation of these bricks again possible.—Franklin continues sinking. The shaft is now 3900 ft. deep and a station is being cut. The shaft is in the foot-wall of the Pewabic amygdaloid. The mineralized portion of this amygdaloid may be cut by a cross-cut to the west. The Allouez conglomerate is approximately 420 ft. to the east and may be cut by cross-cutting, so that the objective of the present shaft operations is the development, with depth, of these two formations. There will be no 38th level. Whether the

39th will be opened by laterals has not yet been determined. No plans have been made to resume production, but the conditions at the mine and at the mill are such that resumption may be brought about in a very short period of time. There is no production of copper at the present time, the only rock that is going to surface coming from the shaft sinking, which is in the foot-wall trap.

NEVADA

Austin.—The caved section of the Hiawatha tunnel has been repaired by the Austin Nevada Consolidated. The tunnel is advancing to strike the vein at a depth of 140 ft. H. G. Richardson is manager.—International Victory Mining Co. has resumed operations at its Birch Creek property and acquired the Eastern Star, Polar Star, and North Star claims from Frank Cochran and W. A. K. Robertson. Two veins traverse the claims, and a shaft will be sunk on the Eastern Star to open an orebody that shows five feet of milling ore on surface.

Goldfield.—It has been announced that the property of Le Champ-D'or French Gold Mining Co., Ltd., has been taken over by the Mt. Vernon Mining & Milling Co., a Nevada corporation. The property, consisting of 17 mining claims, is 30 miles south of Goldfield in Esmeralda county, and within nine miles of the Tonopah and Tidewater railroad. Plans are being made to build a mill and start development. G. A. Bice is president and S. O. Trescott is secretary.—The output of the Florence mine in the past 30 days approximated \$109,430, according to an estimate by E. A. Byler, consulting engineer. This includes \$98,000 from the Florence Divide lease; \$10,000 from the Giles lease, and \$1200 from the Arnold lease. Several applications for leases have been received and are under consideration by the management.—The Silver Glance Mining Co. has been incorporated to operate four claims at Coaldale. Ore containing gold and silver is exposed and several shipments have been made. Louis Sigmund is president, and M. Sigmund secretary-treasurer.—Washington Gold Quartz Mining Co. has arranged for resumption of work at the Randolph group, nine miles from Bonnie Clare, with J. K. Turner manager. Development includes a 410-ft. shaft and an adit 726 ft. long. Two veins have been developed, with the ore sampling from \$15 to \$40 per ton. The ore is principally lead carbonate and lead sulphide, with some gold and silver occurring. The main vein ranges from 5 to 15 ft. wide.

Loring.—Ex-Congressman E. E. Roberts of Reno, and W. I. Beauchamp of Loring, have purchased control of the Sheepherder's Dream property and arranged for immediate erection of a 50-ton mill. This was the first property on which rich ore was found in the district. Roberts also controls the New Willard Metal Mines Co. This camp was formerly known as Willard, but the name was lately changed to Loring in honor of W. J. Loring, the Californian mining engineer.

Mina.—Work in driving and cross-cutting at the Simon Silver Lead is progressing rapidly with favorable results.—The Simon Fagan mine, under the management of E. S. Chafey, is making encouraging progress. The vein is widening and the grade of the ore seems better.—On the Pierce-Likens property, about 1½ miles from the Simon Fagan, a strike of \$50 ore is reported, only 10 ft. from the surface.—Al Annett of the Norman Silver Mines Co. reports that the new hoist is very nearly ready for operation, and that the mine looks better than ever.—The Consolidated West Extension is pushing the cross-cut on the 110-ft. level, and the formation warrants a most hopeful outlook for the near future.—The Simon Junior is being developed under the superintendence of R. G. McDonald.

The main tunnel is in about 100 ft. and recently cut through the calcite vein, and it is expected it will shortly reach the rhyolite and calcite contact where the ore is expected to be found.

Rosebud.—Four feet of ore sampling 300 oz. of silver has been uncovered by the Church lease near the Dreamland mine, in the north end of the camp. The ore was found near the surface. A few years ago Rosebud attracted much attention as a result of rich discoveries but the limited development failed to uncover persistent orebodies. The district is five miles from Sulphur, a station on the Western Pacific.

Unionville.—Ore running high in tungsten has been discovered in the Arizona mine, operated by the Sunset Mining & Development Co. Three teams are hauling concentrates containing tungsten, silver, and gold to Mill City, for shipment to Utah smelters. The mill is running steadily and late developments have been satisfactory. The property is one of the oldest silver producers in Nevada.

UTAH

Marysville.—Operations at the Bully Boy mill on the old Webster mine in Pine canyon, after four years of inactivity, have been resumed. Recently Michael Barnett, agent of the Bully Boy company, arrived here from Pittsburgh, and a force of men was put to work opening up old stopes. The Veteran Mining Co. is driving a tunnel on the Great Western vein with the idea of getting under the orebodies. Recently a shipment of oxide ore that netted \$40 per ton in gold and silver was made from the old Deseret mine. This mine, which is the property of the Elias Morris estate of Salt Lake City, was re-opened a few weeks ago by Joseph Moss and Charles Carlson of Salt Lake City. The mine is reported to be in excellent condition.

Tintic.—Ore shipments from Tintic for the week ending August 29 amounted to 126 carloads, which is 11 carloads less than shipments a week ago, when the total was 137. The shippers follow:

| | Cars |
|-----------------------------|------|
| Chief Consolidated | 30 |
| Dragon Consolidated | 23 |
| Iron Blossom | 17 |
| Tintic Standard | 16 |
| Mammoth | 10 |
| Eagle & Blue Bell | 8 |
| Colorado Consolidated | 6 |
| Swansea | 4 |
| Ridge & Valley | 3 |
| Empire Mines | 2 |
| Gemini | 2 |
| Alaska | 1 |
| Sunbeam | 1 |
| Grand Central | 1 |
| Victoria | 1 |
| Utah Consolidated | 1 |
| Total | 126 |

Theodore Nichols of the Tintic Empire Mining Co. reports that a force of men is at work breaking ground preparatory to installing the head-frame for sinking a shaft midway between that of the Paymaster and the proposed shaft of the Lehi Tintic. It is stated that a contract has been let for a bunk-house, boarding-house, and blacksmith-shop, and the buildings will be in course of erection this week.

BRITISH COLUMBIA

Camborne.—R. R. Christie, of the New Era Mining Co., bondholders of the Beatrice mine, left Vancouver for Camborne on August 12 with a crew of men. It is the intention to re-open the Beatrice mine and keep a fair-sized crew on the ground through the winter.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

H. W. Turner has gone to central Idaho.

Fred. G. Farish, of New York, is in San Francisco.

H. E. West has returned to Santa Barbara, where he will now reside.

H. Foster Bain visited C. W. Purington at Vladivostok recently and is now at Peking.

Robert A. Schmucker has returned from New York to the Braden Copper Co., at Rancagua, Chile.

C. M. Weld has returned from war work at Washington to his consulting practice at New York.

H. G. Young, Lieutenant, has returned from France and is now at the Military Hospital at Quebec.

Robert S. Lewis has returned to the University of Utah, Salt Lake City, from Huntington Lake, California.

H. M. Kingsbury is returning to London from the Cape Copper Co.'s mines at Ookiep, in South-West Africa.

E. C. Bloomfield, Lieutenant in the Canadian Engineers, sailed on August 30 for the Burma Mines at Namtu.

H. D. McCaskey, of the U. S. Geological Survey, has left Washington to be stationed at Central Point, Oregon.

Jackson A. Pearce has gone to Santa Rosalia, Lower California, on metallurgical work for the Compagnie du Boleo.

Gilmour E. Brown, of Shanghai, arrived in San Francisco on the 'Empress of Asia', on his way to New York and London.

Herbert W. Gepp, general manager for the Electrolytic Zinc Co. of Australasia, passed through San Francisco on his way from Melbourne to New York.

Charles W. Wright, manager for the Pertusola Mining & Smelting Co., in Italy, has been on a visit to Marquette, Michigan. He will return to Europe early in September.

Carl H. Beal has resigned from the U. S. Bureau of Mines and has associated himself with Robert B. Moran as a firm of consulting geologists and engineers in the Sharon Bldg., San Francisco.

Walter Karri-Davies, who has been representing the British Provost-Marshal in San Francisco, with the rank of Colonel, has gone to Victoria, B. C., where he will remain for a time.

Henry Clay Callahan died at Los Altos, California, on August 30, at the age of 66. We deeply regret to record the fact. Further notice will appear in our next issue.

Frank W. Oldfield died in England on August 26. He had been suffering from Bright's disease for several years, while manfully attending to his duties as manager for the Cinco Minas Co. in Jalisco, Mexico. He graduated from the Royal School of Mines, London, in 1901 and obtained his first important appointment in 1903 as superintendent of the Zaruma mines, in Ecuador, remaining there four years. Between 1910 and 1913 he was manager for the Mexican Mines Co., in Mexico, and in 1913 he was placed in charge of the Cinco Minas, which prospered greatly, even during the revolutionary troubles, while under his management. He showed unusual tact and unflinching courage in his attitude toward the various groups of bandits that made depredations on the little community under his supervision, but the anxieties incidental to these experiences served to aggravate the disease to which he finally succumbed. A clever technician, a capable manager, an honorable engineer, and a faithful friend, his untimely death will be deeply regretted by many in Mexico, the United States, and England.

METAL PRICES

San Francisco, September 2

| | |
|--|-------------|
| Aluminum-dust, cents per pound..... | 50—80 |
| Antimony, cents per pound..... | 10.50 |
| Copper, electrolytic, cents per pound..... | 24.00 |
| Lead, pig, cents per pound..... | 6.25—7.25 |
| Platinum, pure, per ounce..... | \$105 |
| Platinum, 10% Iridium, per ounce..... | \$121 |
| Quicksilver, per flask of 75 lb..... | \$95 |
| Spelter, cents per pound..... | 9.50 |
| Zinc-dust, cents per pound..... | 11.00—13.50 |

EASTERN METAL MARKET

(By wire from New York)

Sept. 2.—Copper is quiet and easy. Lead is inactive but steady. Zinc is dull and lower.

SILVER

Below are given official or ticker quotations, in cents per ounce of silver 999 fine. From April 23, 1918, the United States government paid \$1 per ounce for all silver purchased by it, fixing a maximum of \$1.01½ on August 15, 1918, and will continue to pay \$1 until the quantity specified under the Act is purchased, probably extending over several years. On May 5, 1919, all restrictions on the metal were removed, resulting in fluctuations. During the restricted period, the British government fixed the maximum price five times, the last being on March 25, 1919, on account of the low rate of sterling exchange, but removed all restrictions on May 10. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the normal rate of exchange.

FOREIGN EXCHANGE

Foreign exchange was generally steadier during the week, particularly sterling. It is probable that the break the week previous on the Lloyd George speech left a much smaller total of bills hanging over the market, and the recovery reflects considerable short covering as well as the effect of selling foreign-held securities in New York, and the accumulation by Americans of funds abroad at low rates. Continental exchanges continue noticeably weaker than sterling, although following the latter's lead of less violent fluctuations. For the purpose of helping trade relations between the United States and Italy, a credit concern with \$100,000,000 capital, of which American bankers will take one-half and Italians the balance, is being formed. The Italian government will be asked to guarantee a return on the stock at either 5% or 7% and to guarantee credits up to \$500,000,000, which the company will be prepared to extend. It is understood the Italian government has informally agreed to at least a part of the guarantee. The plan calls for the deposit by the Italian government of its bonds at 50 cents on the dollar. Should the credit organization be perfected as now planned, two others will probably be formed, each with similar capital, for handling British and French business. If it should be believed, there will be sufficient bottoms available for its purposes. Little definite progress, however, apparently is being made in the matter of wholesale financing of credits to Europe; the questions of the Administration's attitude, of co-operation by the general business world, of the status of the domestic investment market, and of the interest rate, are still in flux. Meanwhile there is reported a considerable flow of money to Germany at the bargain rate of slightly less than a nickel for the mark, by Americans who bought German goods before the War and by those wishing to remit to relatives in Germany and Austria.

A reflection of the current exchange position is observed in the marketing here of considerable quantities of American railway bonds held in allied countries, the discounts of 15% and 36% on English and French currency, even at bid prices several points under the current market for these securities, constituting a strong incentive. Thus the movement of securities this way helps in a small way to offset the flow of goods outward. The real relief force, however, must be on a vastly larger scale, in the form of credits. As to this a lead is still awaited from Washington, which in turn stresses the need of first passing the treaty.

Gold. Gold holdings of the United States, including coin and bullion in Treasury, fell off \$105,539,358 during July, to \$2,989,548,109 on August 1, the smallest holdings since March 1917, when they stood at \$2,968,355,434. On April 1, 1917, gold holdings first crossed three billion, being \$3,088,904,808, and August 1, 1919, for the first time since our entrance in the War, they fell below three billion. From 1915 until April 1917 gold holdings increased about \$1,000,000,000, as Europe shipped gold to pay for war supplies and sustain her credit. When we entered the War gold imports fell to a minimum, as the United States Treasury advanced billions of dollars in credits to our allies. An interesting feature of our distribution which these shipments are taking. Among the most recent recipients are Venezuela, Guatemala, Switzerland, Japan, and China.

Quotations on September 2 are as follows:

| | | | |
|-----------|--------|-------|------|
| Sterling: | Cable | | 4.21 |
| | Demand | | 4.20 |
| Francs: | Cable | | 8.10 |
| | Demand | | 8.12 |
| Lire: | Demand | | 9.60 |
| Marks | | | 5.00 |

Eastern Metal Market

New York, August 27.

All the markets have again turned quiet, but prices in most cases are firm.

Outside copper quotations are at least 1c. under those of leading producers and sales have been made at both levels.

The tin market is uneventful. Arrivals are large and spot Straits is easier.

The lead market is quiet but strong with sales moderate.

Demand for zinc is light and trade is at a standstill. What is being done is largely by second hands who are trading in bills of lading.

Antimony is quiet and unchanged.

IRON AND STEEL

The opinion of the steel trade that the strength of the strike movement, engineered by the American Federation of Labor, has been greatly overstated is unchanged in view of last week's development, says 'The Iron Age'. The President's stand against a sweeping railroad wage advance has not helped the steel strike drive. The large majority of mill workers are opposed to being thrown out of employment. Neither manufacturers nor consumers of steel are apparently taking steps to stock up in anticipation of a strike. Export trade is still expanding, with the Orient, South America, and neutral countries good buyers. One large steel export company reports its August business the best of the year.

COPPER

There are virtually two copper markets and quotations depend on which one is taken. Virtually all the producers of electrolytic will take no business at less than 23.50c., New York, for August-September delivery or 24c., New York, for October. Some business has been done at these prices. From outside dealers and second hands, however, this grade of copper can be obtained as low as 22 to 22.25c., New York, for early delivery, at which level some business has been done. Some contend that a substantial amount is obtainable in the outside market while others claim that this metal has been pretty well disposed of. In the absence of any definite proof we quote the market at 22.25c., New York, for electrolytic copper for early delivery. Lake copper is closely held at 23.50 to 24c., New York, for early delivery by all producers. Whether obtainable from second hands at lower prices it has not been possible to determine. Because of the unusual conditions prevailing in the exchange markets, foreign inquiry has not developed as it is expected it will later. Demand from domestic consumers is light and although the market is generally quiet, the tone is strong.

TIN

The feature of the market is the free arrivals of tin, which have been large this month. Thus far these have amounted to 4055 tons, with 4090 tons reported afloat. Of the total arrivals, 2805 tons has come in at Atlantic ports. Because of this the price of spot Straits tin has softened slightly to 56c., New York, at which level some business is reported. Early last week an active business was done in future shipments from the Straits, but since then demand has fallen off and this phase of the market is quiet. Closing prices yesterday for future shipment were as follows: September shipment from the Straits, 52.50c., with October shipment at 52.25c.; Lamb & Flagg, prompt shipment from England, 52.25c., with prompt Straits from England at 53 to 53.25 cents.

LEAD

The outside market is still getting stronger and gradually approaching that of the leading interest, but as it comes nearer to the latter the upward movement is slower. The quotation of the American Smelting & Refining Co. continues unchanged at 6c., New York, or 5.75c., St. Louis; that of the outside market is 5.90 to 5.95c., New York, or 5.75c., St. Louis. There is not much activity but the tone is firm. One seller reports sales of at least 1000 tons at 5.95 to 6.05c., New York, in the last week.

ZINC

The market is lifeless. Producers contend that at present levels there is no profit and refuse to be interested except to buyers willing to pay higher than 7.60c., St. Louis, or 7.95c., New York, which seems to be the nominal market. Some producers say their price is 8c., St. Louis, or 8.35c., New York. There is no demand and hence no market. The general consensus of opinion is that 7.60c., St. Louis, or 7.95c., New York, is a fair quotation. It is stated that most of the trading being done is in bills of lading which are being freely handed around by outside interests and speculators. Demand from galvanizers is light because of the possibility of a strike in the steel industry, and brass makers are now in no need of zinc. Ore prices are again high. The fact that natural gas interests are attempting to double rates for the second time is a disturbing factor in some producing sections.

ANTIMONY

There is but little change. Wholesale lots for early delivery are still quoted at 9.25 to 9.37½c., New York, duty paid, with demand light.

ALUMINUM

Quotations are unchanged at 32 to 33c., New York, for wholesale lots of virgin metal, 98 to 99% pure, for early delivery.

ORES

Tungsten: The absorbing topic has been the passage by the House of a bill placing a duty on tungsten ore and alloys. On ores \$10 per unit is prescribed and on tungsten and its alloys, \$1 per lb. of contained tungsten. It is too early to obtain a resumé of opinion as to the effect of this action, but to many it has come as a complete surprise and there are various opinions for and against heard here and there. Already the market is stiffening and quotations are higher on a somewhat brisker inquiry. It is too early to judge of the effect on the market. Values of ferro-tungsten have not been tested recently so far as ascertainable. It is understood that the tariff measure is to be retroactive in certain respects.

Manganese: An Eastern steel company has bought a substantial quantity of ore at 5c. per unit and has arranged with an Eastern producer to convert this into ferro-manganese.

Manganese-Iron Alloys: British quotations for ferro-manganese are as low as \$100 to \$105, seaboard, and it is evident that producers there are endeavoring to regain the American market which they had before the War. In 1913 they furnished 50% of the alloy consumed in the United States. That they may succeed is strengthened by the fact that the American output now is down to a pre-war basis or about 10,500 tons per month, as against one of 28,750 tons per month in 1918. Spiegeleisen is firm at \$35, furnace. About 5000 tons has been sold for export in the last two or three months.

INFORMATION FURNISHED BY MANUFACTURERS

SOCIETY FOR THE PREVENTION OF CRUELTY TO MOTOR TRUCKS

Alfred F. Masury, chief engineer for the International Motor Co., manufacturer of Mack trucks, has suggested a society for the prevention of cruelty to motor trucks.

"Just because a truck can't feel is no reason why it should not be handled with care," argued Mr. Masury with sympathetic fervor for the much abused misused motor truck.

"The economy and efficiency of machinery lies in the way it is handled and treated. We need a society for the prevention of cruelty to our modern iron horses which feed on gasoline, just as we did for the old consumers of hay and grain.

"Trucks need one kind of care in hot weather and another kind in cold weather.

"Straw hats are put on horses to protect them from the excessive heat of summer; but very often drivers will forget to see that there is sufficient water in the radiator and enough oil in the oiling system to lubricate the various bearing surfaces.

"In winter horses are sheltered from the cold in stables and given an extra amount of bedding; but very often a truck will be allowed to stand over night without the water being fully drained from the radiator.

"If the horse is neglected, the animal suffers pain, and our humane societies see to it that it is stopped. But, if the truck is mistreated, it feels no pain and no one gives it any sympathy. The owner gets a severe pinch in his purse, and may hold up his right hand and swear, 'Never again'. But that is about as far as it goes. Users in general go on year after year, paying out large bills incurred through ignorance, carelessness, and indifference.

"We need a society to educate users of motor trucks to their proper care, winter and summer, and in all kinds of weather. It will mean longer life for all trucks, greater efficiency and economy, better service and greater satisfaction in every way."

ORONITE ENAMEL PAINT

Where materials and structures are exposed to severe conditions, particularly to the action of acids, acid fumes, alkalis, and salt water, protection by means of a special preservative paint is an absolute necessity. Oronite enamel paint has repeatedly proved its value as a protection against all kinds of deterioration and corrosive forces. It is unaffected by conditions which would quickly destroy materials and buildings were it not employed. On hot surfaces, such as boiler fronts and stacks, its use is invaluable. One of the largest boiler works in the North-West manufacturing steel tanks, donkey engines, and other heavy machinery, always paints its products with Oronite enamel paint before sending them out from the shops.

It is a well recognized fact that high temperatures make all kinds of metal surfaces much more easily affected by corrosive agents. Gas-making equipment is usually sub-

jected to very high temperatures, and it has been particularly difficult to obtain paints that would protect the metal. Oronite enamel paint has been found by a number of gas companies to give entire satisfaction, and several of them have standardized it for use throughout their plants. Engineers of gas companies have had long experience in the painting of generators, and the fact that Oronite enamel paint has been used by these engineers is sure proof of its value for this purpose.

Another use for Oronite enamel paint is in coaling stations. It was tested out recently in this connection and found to be the best preservative for all metal surfaces, including structural metal, hoists, dump cars, cranes, and buckets. Perhaps the severest service to which Oronite enamel paint can be put is in smelters and mining plants. In such places the machinery and structural steel work are subjected to acid fumes which quickly destroy all metal if it is not properly protected. Oronite enamel paint has proved a great success on smokestacks, boilers, and electrical machinery. A large mining company in Arizona is using it for insulating purposes, painting its underground motors where the water is polluted with copper, on its transmission lines, and elsewhere as an insulating coating.

These few examples of the use of Oronite enamel paint will serve to show its value under every sort of condition where protection against severe exposure is needed.

COMMERCIAL PARAGRAPHS

N. S. Braden has been appointed vice-president for Canadian Westinghouse Co., Limited.

Dunham, Carrigan & Hayden Co., San Francisco, have been appointed Pacific Coast distributors of the Nordstrom valve.

The Denver Engineering Works Co. has recently contracted for the exclusive manufacture and sale of commercial sizes of the Samson crusher.

Coast Equipment Co., Merchants Exchange, San Francisco, has been appointed representative for the Atlas Car & Mfg. Co., for California and Nevada. All inquiries from this territory should be addressed accordingly.

Arthur B. Reynders, former Director of Production of the Westinghouse Electric & Manufacturing Co., at East Pittsburgh, has recently been made works manager of its East Springfield plant. A. E. Kaiser, who has been Assistant Director of Production since 1912, has been appointed Director of Production, to fill the vacancy made by Mr. Reynders' new appointment.

The Goodyear Tire & Rubber Co. of California, with its principal place of business in Los Angeles, has been permitted by Commissioner of Corporations E. C. Bellows to sell 60,000 shares of its preferred capital stock at par, \$100, for cash, so as to net 98% of the selling price. It also is permitted to sell to Goodyear Tire & Rubber Co., of California, 30,000 shares in exchange for certain property rights, assets, and goodwill of that corporation at par for

cash. The company has an authorized capital stock of \$20,000,000 divided into 200,000 shares of the par value of \$100 each, 100,000 shares being preferred and 100,000 shares of common stock.

By change of name, but no change in its active organization, the Car-Dumper & Equipment Co. succeeds the Wood Equipment Co., the new style being considered better representative of the business of this concern, whose principal item of product is rotary dumpers for mine and railroad cars. General offices are at the company's plant, 1216-1222 E. 75th St., (Grand Crossing) Chicago, Illinois.

In order to meet the large and growing need for Plymouth industrial locomotives, clay working machinery, and other Plymouth products, The Fate-Root-Heath Co. announces that on July 1, 1919, it succeeded to the business of the J. D. Fate Co. and the Root-Heath Mfg. Co. The consolidation greatly increases their capacity and resources and enables them to meet every demand for products of the above two companies.

The Chicago Pneumatic Tool Co. plans moving its general offices from Chicago to New York and toward this end is erecting an office building at 6-8 East 44th St. The structure is being built by the Westinghouse Church Kerr Co. of combination steel, brick, and limestone, and will comprise initially ten stories. The ground floor is to be an exhibition room and will display Chicago Pneumatic prod-

ucts, including Boyer pneumatic hammers, 'Little Giant' pneumatic and electric tools, rock and coal drills, 'Giant' oil and gas engines, and air compressors, some of which will be shown in operation. In conjunction, a completely equipped service station will be maintained. The operation of the company's six American plants and twenty-six sales and service branches can be directed more economically from New York. There will be continued in Chicago a sales and service organization more extensive than formerly. The new building is to be ready for occupancy early in 1920, at which time the transfer will be effected.

On January 22, 1919, the Plymouth No. 5 breaker of the Hudson Coal Co. was burned to the ground. The breaker was of wood construction throughout and the fire left it a mass of ashes and tangled junk. Before the ruins had cooled, steps were taken for its replacement. The decision reached called for an all-steel structure with concrete floors, to be roofed and sided with non-inflammable material. On February 22 the contract was awarded the H. H. Robertson Co. to furnish and erect all necessary roofing and siding material for the breaker and main conveyors. Black corrugated sheets 22 gauge, were selected for the roofing, and red corrugated 24-gauge sheets for the siding. On February 5 the pouring of concrete foundations began, these being completed on February 26, and on March 12 steel erection was commenced by the contractors, the Bethlehem Fabricators, Inc., this being completed April 23. The original time table, or schedule of erection, as prepared in advance by the Coal Company engineers, called for erection of roofing and siding to commence on May 10, and it was with some surprise that word was received on April 7 that the steel erection had progressed to a point where they were ready for the roofing to be shipped. Erection of roofing began on April 27, and was completed on May 5. Erection of siding sheets having to follow the work of other contractors could not progress so rapidly, but this was finished by June 5. On June 2 the machinery of the breaker was running and 300 mine cars of coal were run through. On June 6, 1800 cars, about 4000 tons, went through and the new breaker was working practically to capacity in just 130 days from the time of the fire, beating the company's best estimate by 20 days and setting a new record for construction work in the anthracite fields. In addition to the contract for the main breakers, the H. H. Robertson Co. later received the roofing and siding work for the coal and slate conveyor housings and the roofing and siding for the building being erected by the Dorr Co., to contain the coal washing and classifying machinery. Robertson black structural paint is used as a special protective coating for parts of the steel work where moisture conditions are severe, and Robertson red and black rubber coat has been applied to some older buildings, of Robertson process metal, which were untouched by the fire.

MOTOR TRUCKS IN HIGHWAY CONSTRUCTION

Good roads and the motor truck may be said to be growing up together. One is aiding in the development of the other. Modern trucks are playing a prominent part in the building and maintenance of highways throughout the country. Horse-teams have been displaced entirely by the motor truck in road construction work in most localities.

Garford 7-Ton Tractor with Dump-Type Semi-Trailer

The result has proved a saving in time, labor, and expense. The accompanying photograph shows one of the latest types of semi-trailer used in hauling crushed rock for road building. The motor truck furnishing the power is a Garford 7-ton tractor. It is predicted that the time is not far off when every community will own and operate a fleet of motor trucks and trailers in highway maintenance work.

The high efficiency and dependability of G-E Synchronous Motors are relied upon in many industries today.

Three 212 h. p.-225 r.m.p. Synchronous Motor-driving Compressors in a railroad shop

88,000 h.p. of synchronous motors supplied in 1918 for air compressor drive

FOR a quarter century the General Electric Company has supplied synchronous motors designed for the particular work to be done. The first ones furnished are still in continuous service requiring maximum dependability.

For industrial drives these motors are furnished from 25 to 2000 h. p. capacity with speeds from 80 to 1800 r. p. m. and are designed to start any load met with in commercial practice without excessive current demands upon the power circuit.

The very high efficiency and dependability of these motors are due to their excellent design which is based on thorough testing of both raw materials and finished motors.

Our engineers will be pleased to supply additional information on these motors.

AMONG the subjects to be discussed at the forthcoming meeting of the Institute at Chicago will be the Federal Taxation of Mines. We are glad to note that the subject will be presented by Mr. L. C. Graton, who is a member of the Valuation Section of the Internal Revenue Bureau and by his knowledge of mining affairs is peculiarly fitted to discuss the problems involved.

CANADIAN soldiers discharged prior to the signing of the Armistice, and Canadian soldiers that did not see service in France, under the original Order in Council dealing with the payment of War Service Gratuities, were not entitled to participate. We have just received a notice that under a recent Order in Council this ruling has been changed, and men who come under these classifications are now entitled to payment of the Gratuity. As a great many of these men are now resident in the United States, we publish this here to bring the matter to their attention. Soldiers entitled to the Gratuity should write to the Secretary, British Columbia Returned Soldier Commission, Victoria, B. C., enclosing a copy of their discharge certificates. Necessary application forms will then be sent.

MUCH rubbish is appearing in the daily press concerning Washington's dictum about entangling alliances and the moral to be applied therefrom to the Peace Treaty and the League of Nations. Without going into the merits of the Treaty or the Covenant, it would seem evident that a caution given a century and a half ago, even by the most farsighted of statesmen, cannot be applied with any force to present conditions. At a time when it took as long to travel by stage-coach between New York and Boston as it does now to travel between New York and London, and when messages were carried by courier instead of being telegraphed or telephoned, the prevention of entangling alliances was a relatively simple matter. Today the case is not so simple. The effect of the tremendous development of methods of communication and travel during the last half-century has been to narrow the Atlantic to a mere river; Europe is just over the horizon; the theory of avoiding entanglements by leaving other nations alone is no longer practicable. Our new neighbors are here, at our doorstep, and deal with them we must. Our isolation, which resulted from lack of means of communication, is gone for ever; entanglements, or the lack of them, depend upon

the manner in which we choose to comport ourselves toward the rest of the world.

REVIVAL of British interest in Mexican mining affairs is indicated by the organization, in London, of a new corporation having unusually ample financial backing, "with a view to the acquisition of some apparently highly promising interests in Mexico that the parent companies' management has recommended after investigation". We quote our esteemed contemporary the 'Financial Times'. The "parent companies" that are co-operating in this venture are the Camp Bird and Santa Gertrudis, which recently acquired control of the El Bordo group of mines at Pachuca, in Hidalgo. The capital of the new company, called the Mexican Corporation, Ltd., is £1,000,000. We forbear from translating this sum into dollars because the old rate of exchange has become fictitious and the current one is too variable to permit of accurate equivalency. Of the capital, £850,000 has been placed 'firm' with the following representative mining companies: the Consolidated Goldfields of South Africa, the Consolidated Mines Selection Company, the Central Mining Corporation, the Imperial & Foreign Corporation, the Lena Goldfields Company, the Lake View group of companies, and the Exploration Company. The remaining £150,000 of the issue will be offered *pro rata* to the shareholders of the Camp Bird and Santa Gertrudis companies and will be used as working capital; it has been underwritten already. This flotation will have the effect of releasing the whole of the earnings of the two parent companies for distribution in the form of dividends, instead of using the earnings for new business. The Mexican Corporation is remarkable on account of the talent and character represented on its board of directors, namely, Mr. Frederick W. Baker, chairman of the Camp Bird and Santa Gertrudis companies, Mr. R. T. Bayliss, chairman and managing director of the old Exploration Company, at one time so honorably prominent in Western American mining, Mr. Walter McDermott, chairman of the Consolidated Mines Selection Company, and formerly managing director for Fraser & Chalmers, Mr. F. A. Govett, chairman of the Lake View & Oroya and Lake View & Star companies, and formerly closely associated with Mr. H. C. Hoover in many Western Australian ventures, Mr. A. Stanley Elmore, of flotation fame, a director of the Camp Bird and Santa Gertrudis companies, Mr. H. Guedalla, a director of the

Burma Corporation, Mr. John A. Agnew, an American mining engineer who may be said to have stepped into the position rendered vacant by Mr. Hoover's retirement from British mining activities, and Lord Brabourne, a director of the Consolidated Goldfields of South Africa, the Natomas Land & Dredging Trust, and the Oroville Dredging Company. It would be difficult to select a group of men more representative of London mining finance. We wish them complete success in their new enterprise, feeling confident, among other things, that no such performances as marked the flotation of the Santa Gertrudis will be tolerated by them. We refer to the heavy promotion loot taken by the consulting engineer of the Camp Bird when that company acquired the Santa Gertrudis mine. Messrs. Bayliss and McDermott stand conspicuously for the highest code of conduct in mining affairs and some of their colleagues share that reputation with them. Apart from its personnel, this enterprise is notable in that it suggests an optimistic view of Mexican political affairs and an expansion of British activity in the exploitation of Mexican mines.

DURING the week we received a friendly call from a Denver mining engineer, and in the course of conversation he asked whether there was much mining still being done in the Mother Lode region of California. We are used to the question and have learned not to resent the suggestion that gold mining in the historic districts of this State is largely a matter of the past. The impression that it is so is due to the unwise policy of the local syndicates that operate most of the mines, efficiently and successfully, but with an archaic love of secrecy that does them no credit and detracts from the good repute of the Mother Lode region. Despite the long-continued productiveness of such splendid mines as the Kennedy and Argonaut, despite the highly successful re-opening of the Plymouth, and the more recent expansion of operations at such mines as the Carson Hill group, it is difficult to engage the interest of capitalists in Mother Lode mining because so little publicity has been, or is being, given to the operations extending through the counties of Tuolumne, Calaveras, and Amador more particularly. Here is the place to acknowledge the notable service performed by Mr. W. J. Loring, himself a native of California, who induced British capitalists to join with him in re-opening the Plymouth, in Amador, which has already produced \$3,400,000 worth of gold, yielding a profit of \$1,000,000, since the resumption of work under the Plymouth Consolidated Gold Mines Ltd. in 1913, and the total expenditure of \$960,000. Mr. Loring likewise induced some of his Boston clients to finance the operation of a group of old properties in Calaveras county, including the Morgan and the Calaveras Consolidated, covering 9650 feet on the lode, and these are now producing \$100,000 of gold monthly. Again, he re-opened the Dutch and App mines in Tuolumne. We mention these facts with no little pleasure because Mr. Loring, after wide experience in other countries, has returned to California and set to work

with a proper regard for such publicity as is helpful to all concerned. The companies with which he is connected issue monthly reports and are always willing to supply information to those having a proper reason for asking it. We commend this example to his neighbors.

ROMANCE still survives in mining, as is suggested by the story of the discovery made at Randsburg in southern California. Mention of it has appeared in our news columns from time to time. It appears that a couple of prospectors, of the kind known in the South-West as 'desert rats', one of them being a half-breed Indian, together with a former sheriff of Kern county, were grubstaked by a group of citizens living at Bakersfield. The two prospectors are Hamp Williams and John Noser, and the ex-sheriff is Mr. John W. Kelly. Their backers were Messrs. Alfred Harrell, J. M. Jameson, E. T. Grady, J. A. Hughes, Dough L. Clarke, and two ladies named Ruby Southwick and Edith Coons, the last being the former Assessor of Kern county. These seven subscribed \$200 apiece for the venture. In June the prospectors located a claim in an old mining district, being influenced to do so by an outcrop that apparently had been overlooked in days gone-by. The site of the discovery is within 1½ miles of the town of Randsburg, in San Bernardino. It is a district known chiefly for the success of the Yellow Aster, a gold mine of some celebrity and about 2½ miles from Atolia, famous for its tungsten. The first assay of a piece of quartz showed \$75 in silver, as argentite. A hole 21 feet square was sunk and is now about 50 feet deep. Everything that has come out of it has been shipped to the Selby smelter, near San Francisco. The discovery was within a hundred yards of a paved highway and only three-quarters of a mile from a railroad, the Santa Fe line between Kramer and Johannesburg; so all that the diggers had to do was to shovel the ore into a motor-truck and take it to the old siding that the railroad officials had almost forgotten. They started on an 18-inch streak of high-grade ore that widened to 15 feet; all of it suitable for shipment in carload lots that averaged 150 ounces per ton. The original capital subscribed for the venture was \$1400; the fortunate adventurers have received \$250,000 already. When Noser and Williams had sunk 30 feet they decided that a little 'real money' would be welcome, so each of them sold half of his eighth interest for \$50,000 apiece to a group of Bakersfield merchants. They still retain their respective sixteenths. They have located the whole country around their 'glory hole', besides a townsite. Reserving 600 by 800 feet of ground around the discovery, they are leasing the outside territory in sections 200 ft. wide and the full width, 1500 ft., of their property, at royalties ranging from 15 to 25%. The enterprise has been organized as the Rand Divide Mining Company and the stock will be distributed among the present shareholders. It may be far from Divide and still farther from the Rand, but this young mine seems worthy of its sponsors. We would like to see them develop it and reap the full fruit of their enterprise.

The Diesel Engine in Mining

The first notable installation of Diesel engines for mine-power is described in this issue by Mr. C. Legrand, engineer to the Phelps Dodge Corporation. To many it will seem like a far cry from the introduction of the Diesel engine into the United States in 1903, to the Phelps Dodge installation at the Burro Mountain property in 1912, nine years later. The original Diesel patents were taken out by Dr. Rudolf Diesel in 1892, but it was not until the St. Louis Exposition in 1904 that we first saw a Diesel engine. It had been brought to the United States from Germany by the late Adolphus Busch, who afterward acquired the American rights to manufacture and sell under the Diesel patents. Thus was born the so-called American Diesel engine, as distinct from the English, French, Italian, Belgian, German, and Swiss Diesels, which were built under license from the inventor, one license being issued for each country. But the development of the American Diesel lagged, while Europe took the Diesel seriously and went vigorously to work to solve the many complex mechanical problems involved in converting the theoretical Diesel cycle into a practical power-generator, and soon the Willans-Diesel of England, the Tosi-Diesel of Italy, the Sulzer-Diesel of Switzerland, and the Carels-Diesel of Belgium were favorably known. Each was the same in fundamental principle, but differed in mechanical details.

The Diesel cycle created a set of new and unprecedented conditions in engine design. The pressure of compression in the cylinder is about 480 pounds per square inch; the temperature is about 1000°F. at the time the fuel is sprayed through the atomizing-nozzle at a pressure of from 900 to 1000 pounds per square inch. These working pressures and temperatures require the greatest nicety of cylinder design and foundry mixtures. The engines in the Burro Mountain plant are fitted with water-jacketed cylinders, pistons, cross-head slides, cylinder-heads, and exhaust-pipes, and on the efficiency of the cooling-devices depends to a considerable extent the continuity of operation of the engine. The classic treatise of Dr. Diesel, published in 1893, had the title 'Theory and Construction of a Rational Heat-Engine to Replace the Steam-Engine and Internal-Combustion Engines of Today'. Allowance may be made for the exuberance of the inventor, for without detracting in the least from the undoubted epoch-making character of the Diesel cycle, neither the steam nor the so-called gas or Otto-cycle engine has been replaced. On the contrary, each has developed its own field of application through its individual characteristics, the Diesel engine adding itself to the ranks of power-generating devices without displacing either of the other two. Undoubtedly the engineering and economic considerations that prompted the selection of steam for the Inspiration power-plant were just as sound as those that caused the selection of Diesel engines for the Burro Mountain plant. If fuel consumption were the only element to be considered, and

oil were available, the Diesel would sweep the field for every power purpose except motor-vehicles; but many other points also influence the selection of power-generators. The questions of load-factor, overload capacity, and the cost of each type of fuel at the power-house site are of prime importance. The four-stroke cycle engine is expensive in first cost, as compared with the same number of power impulses offered in the single-cylinder steam-engine. The two-stroke cycle engine is cheaper than the four-stroke, but not so economical of fuel. The overload capacity is low as compared with the steam-engine, about 15% as compared with 50%, or even 75%, for steam for short periods. Therefore, in a Diesel installation it is necessary to install power-capacity nearly equal to the peak-load, whereas when using steam, from 20 to 40% less than peak generally suffices, provided peak-load conditions are of comparatively short duration.

The grouping of certain power-driven units entering into the average installation of mining and milling equipment with respect to their load-factors is the best plan to pursue, where the installation is large enough to warrant it. Fairly constant loads and a correspondingly high load-factor lend themselves admirably to Diesel engine power. A Diesel engine driving a generator for furnishing power to mills running 24 hours per day would be ideal, and even hoisting-engines fitted with a fly-wheel motor-generator set are adaptable to this type of power, provided the hoist is in fairly constant operation during all three shifts. One interesting characteristic of the Diesel engine is its high efficiency for fraction-loads, there being almost no difference in fuel consumption per horse-power between full load, three-quarter load, and half load. Another is its catholicity of taste as far as fuel is concerned. Anything that is fluid and will burn will drive a Diesel engine. Any old oil, animal, vegetal, or mineral, derivatives from various distillation processes, artificial hydro-carbons, residues, and nut-oils will work, and work well. There are a number of Diesels burning gas-house tar. The tar is dumped in its solid form into a tank fitted with coils heated by the exhaust from the engine, and that is all there is to it. A test on the block was made in the plant of an Eastern manufacturer, and four barrels of fuel-oil were provided for this purpose. The test proceeded; it was satisfactory, and the engines were accepted. A few days later, the shop-foreman ran across the identical four barrels of oil that were to have been used for the test, intact as to contents. Non-plussed, he reported his discovery to the superintendent, who, after investigation, found that, by reason of their external similarity, four barrels of fish-oil, intended for the bolt department machine-tools, had been used for the test, and the Prony brake did not know the difference.

It is a melancholy circumstance that Dr. Diesel, fresh from many honors and a gratifying recognition of his great achievement from the world of technology both in the United States and abroad, mysteriously disappeared from the deck of a Channel steamer on his way to England, and ostensibly was drowned just as his career had reached its zenith. A short time later, the country of

his nativity plunged the world into the greatest war of history, and based its hopes of success on the Diesel-engine equipped U-boats that were to starve England into submission and prevent the passage of American troops to war-torn France. We are pleased to record a higher use of his genius in the winning of metals from their ores for the peaceful needs of civilization and the solving of economic problems for the benefit of mankind.

A Federal Department of Public Works

On another page we print the text of the bill to create this Department and to define its powers and duties. The bill was introduced in the Senate by Senator Wesley L. Jones and in the House by Representative Charles F. Reavis. The proposal that it embodies has been the subject of interesting discussion among engineers ever since Engineering Council called a convention to meet at Chicago last April for the purpose of considering the proposal. This convention was attended by the representatives of 74 engineering societies and showed marked unanimity of sentiment in favor of the proposed national department, which is to include all "the bureaus and services of the National Government having to do chiefly with matters of engineering and architecture". The idea is not a new one; it was advanced 35 years ago and has been revived in consequence of the experiences of the War period, during which it was found that the engineering activities of the Government were scattered among six departments and thirteen bureaus, producing a costly duplication of effort and a great waste of public funds. The subject was brought before the engineers of San Francisco by Mr. Philip N. Moore while he was here as a member of the Commission on War Minerals Relief. He addressed several representative audiences and aroused keen interest in the proposal by his lucid and convincing presentation of the arguments in favor of it. Himself a member of Engineering Council, he described how it was organized and how it had felt its way to useful work, culminating in the appointment of an Engineering Service Committee, at Washington, the expenses of which were underwritten by Mr. J. Parke Channing, the president of Engineering Council. The mere fact that an individual, and not the engineering societies, had to finance this work suggests the unorganized condition of the profession. Experience at Washington prompted the calling of the Chicago conference, which elicited a splendid spirit of co-operation and led to the drafting of the bill now before Congress. The Secretary of the Interior is the head of more engineers than any other department in the world, and it is pleasing to note that he has stated that the proposed Department of Public Works "is in the interests of efficiency and economy, and is inevitable". Those who have participated in various phases of engineering work at Washington during the last two years have been impressed by the waste of energy and money due to the over-lapping and rivaling of the various bureaus. Three

departments will collect the same statistics. We in California may recall the fact that an inquiry into the quick-silver industry, with a view to ascertaining the supply of mercury needed for munitions and other warlike purposes, was made successively by the Geological Survey, the Bureau of Mines, the Department of Commerce, and the State Mineralogist. The statistics of the Geological Survey are not available to the Bureau of Mines; so it starts to compile its own; any request for the data in the possession of the other bureaus has to go from the chief of that bureau to the chief of the other, and so up and down the ranks of officialdom. Each bureau is under a separate Assistant-Secretary of the Interior. The Bureau of Forestry is under the Department of Agriculture and controls water-power resources. Three departments direct the mapping of the national domain. The Bureau of Roads, essentially an engineering service, is likely to spend more money than any other and is under the Secretary of Agriculture. Each department and each bureau strives to magnify its operations in order to obtain an increased appropriation from Congress; it is considered a sin to have an unexpended appropriation or to allow another bureau to perform the same duty; yet as soon as one starts on a given piece of work another will follow suit. The commission sent to Europe by the Bureau of Mines to report on the condition of the mines in the devastated areas arrived when a similar Army commission was just finishing its work and these two commissions went over ground that was also covered by a commission sent to Europe by the Geological Survey. Obviously it is high time to correct such abuses. The various engineering services of the Government spend 60 million dollars per annum and 600 millions is to be spent during the next decade in highways alone. It has been the dream of the great engineers and leaders of the profession for the time of more than a generation, particularly of the civil engineering branch, and now the other branches of the profession, influenced by their war experience, are joining in a united effort to turn the dream into a reality. It might have been well to create a new department of the Federal government with its own member of the Cabinet, but the opposition to such a change would have been greater than the placing of the principal engineering activities under the direction of the Department of the Interior. The bill provides that the change shall be made when the present Secretary of the Interior shall vacate his office and it stipulates that his successor shall be an engineer, with four assistants at \$7500 per annum, appointed under Civil Service rules and therefore not at the mercy of political patronage. There will be opposition, of course, from the officers of the Army, and there remains the possible antagonism of the labor organizations, but if engineers throughout the country take pains to ventilate the subject, so as to obtain public support, and therefore Congressional help, this great plan to improve the Federal administration will be effected in due course, to the benefit not only of the engineering profession but of the Nation.

The Crowe Process

The Editor:

Sir—Referring to Mr. Keith's remarks on the Crowe process in your issue of August 23, I am inclined to think that few metallurgists will agree with Mr. Keith's position in reference to the Crowe patent.

Anticipation is not invention. It is safe to say that no invention of value was ever conceived out of a clear sky. It is for this reason that all patent applications are referred to as 'improvements'. If anticipation were invention, it would be quite easy to show that no one ever invented anything. It could even be shown that Columbus did not discover America and that Wilson and Lloyd George do not deserve much credit for the League of Nations, for, was it not Garrison who said, "The world is my country and mankind my countrymen"?

Any indefinite information that lies dormant for many years, should not be a bar to a valid patent if an inventor evolves something worth while out of the chaos. It is probably this view that largely governed the U. S. Supreme Court decision in the flotation patents.

Denver, August 25.

W. E. GREENAWALT.

A Metallurgical Journey to Shasta

The Editor:

Sir—I have read with interest Mr. Herbert Lang's article, particularly his description of the attempts to smelt the copper ores of Ingot. I am sorry, however, that more information was not given about the earlier attempts in this direction, as I have tried at various times to get this information.

In 1915 the late James Sallee told me of the heap-roasting of copper ores at Ingot, or Furnaceville, as the place was first called. Mr. Sallee spoke also of an attempt to smelt this roasted material, the objective being a matte of sufficient grade to stand shipment to Swansea. This, I think, was thirty or forty years ago. Acting on this information, in 1917, I secured a lease on the Furnaceville burning-ground, which had evidently been forgotten during the various stages of operation and idleness of the mines during these years. Indications showed plainly a long lapse of time since any operations and nothing remained of the smelting-plant, but limestone, charcoal, and considerable slag or matte was found just below the roast-heaps. It is interesting to note that the slag assayed only a little less than the roasted ore, and was all included in my shipments.

The ore was well roasted but the method of roasting differed from the later practice at Butte and in British

Columbia as circular pits about four feet deep and 35 ft. wide were made in the ground, the roasting being done in these pits.

The smelter assays on six cars of this material were as follows:

| Tons | Gold, oz. | Silver, oz. | Copper, % |
|------------|-----------|-------------|-----------|
| 37.8 | 0.05 | 13.15 | 6.17 |
| 42.2 | 0.05 | 14.15 | 6.69 |
| 49.1 | 0.03 | 13.99 | 5.31 |
| 47.5 | 0.015 | 8.20 | 6.01 |
| 42.7 | 0.03 | 9.55 | 4.58 |
| 41.6 | 0.05 | 11.45 | 3.90 |

G. CLEVELAND TAYLOR.

Redding, California, August 23.

The Status of Gold

The Editor:

Sir—Inasmuch as it appeared to me that the debate on this subject was assuming a decidedly academic slant, I had not intended contributing anything further to the discussion. However, two articles have lately appeared that seem to call for some comment. One is by R. B. Brinsmade, in your issue of August 16, and the other is by Irving Fisher in the 'Magazine of Wall Street' under the same date.

It is quite evident that Mr. Brinsmade is a student, and a deeply read one, of political economy. It is further evident that he possesses pet theories regarding taxation as applied to land-values and to inheritances that may have quite as blinding an effect upon his reasoning as, so Mr. Brinsmade accuses, does the monetary theory of Professor Fisher upon that gentleman's reasoning. In my letter, which you printed on February 1, I advanced certain suggestions designed to correct evils in our monetary system and at the same time to lighten our load of taxation. Mr. Brinsmade says my scheme is all wrong, but that all our debts can be readily paid merely by more and differently applied taxation. This looks to me like trying to cure a delirium tremens patient by increasing his consumption of alcohol.

Mr. Brinsmade says, "It is true that much of the money invested in these war bonds was gained with less work than in normal times, and if the policy of permanent price-inflation had merely to do with the re-payment of war-bondholders much could be said for its justice and expediency. Unfortunately, however, a permanent inflation of prices means a general defrauding of creditors by their debtors and such a general social disturbance that no thoughtful economist would advocate it except as a last resort to avoid national repudiation." He then states that the land-value tax and the inheritance tax are

capable of great yields, that fourth-fifths of our great fortunes are inherited, that 2% of our population owns 60% of our wealth, and, finally, "the national health would therefore be vitally stimulated by abolishing our aristocracy, along with our war debt, by a graduated inheritance tax."

He admits that if the payment of war debts were the only object of my proposals, they might be both just and expedient. Unfortunately, he says, the resulting high prices works harm to the creditor class. Even this harm thoughtful economists would condone if the result would be to prevent repudiation of national debts. After this he approves of abolishing our 'aristocracy', along with our war debt, by means of a graduated inheritance tax.

It is quite generally accepted as true that the bulk of our great fortunes consists of credits. For example, capital stock of a corporation is a liability of the corporation and is a credit in favor of the holder of the stock. Corporate and other bonds are direct obligations to pay. If four-fifths of the great fortunes are inherited, and if 2% of our population owns 60% of our wealth, we can figure that 1.6% of the population are in the combination creditor-inherited wealth class and that this class holds some 48% of our total wealth. If this is the outfit that Mr. Brinsmade is after, why not deal them a swift blow with a change in monetary standards instead of inflicting slow torture through the inheritance tax? Why not rest the burden on the shoulders of grown men rather than upon the bodies of babes and children unborn? A confiscatory inheritance tax is no better than anything else that is confiscatory, and Mr. Brinsmade will have to do away with paternal and maternal instincts before he can get anyone to subscribe to the full measure of his program.

Throughout this discussion there has been a clearly defined difference in opinion as to what will happen and should happen to prices. Professor Fisher states that we are on a permanently higher price-level. I do not hesitate to reiterate my statement of last February to the effect that one who engages to readjust price conditions by decreasing the scale of living attempts the impossible. As Professor Fisher points out, the present is but a single one of many price changes. Why shall we assume that the prices of 1913-1914 are correct in every particular? Although I am no octogenarian, I can remember when men worked for a dollar a day and brought up families without going into debt. Why should we not bring prices down to where this is once more possible? Why not reinstate conditions that made it possible for five cents per day to do what five dollars per day does now? Prices and wages are up to stay, just as they went up and stayed up more than once in past history. The man who cannot grasp this fact can present no reasonable argument. If we guard ourselves against fraudulent and fictitious advances in prices, now commonly known as 'profiteering', we do all that we can do.

Not all the political economists are so imbued with the sacredness of the gold eagle in its present magnitude that they brand one who worships not this idol as a disreputable type of iconoclast. Professor Fisher, in the

article to which I have referred, advocates a gold coin of variable weight but of fixed purchasing power. If his suggestions were put in practice the gold dollar would be diminished to half its present weight. If gold were demonitized, and free bidding for the available supply were permitted, it is my firm conviction that each gold coin would be exchangeable for double the quantity of other things that it now is. I do not believe it practicable to change the weight of gold coins monthly, or even yearly, but I do believe that from now on, and so long as the gold standard is maintained, the weight of gold which represents a 'dollar' must be periodically decreased. The time when the decrease is to be effected will be the problem of each generation. It will suffice us of the present if we fit our gold supply to the needs of our times and quit our attempts to trim the needs to fit the gold supply.

While I am upon the subject, allow me to allude to the letter of J. C. McPherson which appeared in your issue of March 22. Mr. McPherson's main criticism of my proposals was that their adoption would inflate our money supply in the same degree that it would be inflated by a too industrious use of the printing-press. He asserts that my suggestions merely substitute the mint-stamp method of coinage for the printing-press method. I may say that such was the result contemplated. My belief is that the world needs more honest-to-God coin. Whether the new coin is yellow or white or both, I assert that conditions will be improved if the supply is augmented.

San Francisco, August 23.

EDW. S. VAN DYCK.

A Message From South America

The Editor:

Sir—Travel broadens the mind, but it is also true that it brings a keener appreciation of all that which one leaves behind, when traveling abroad for a considerable time.

The world events of 1918 emphasize this so sensation-ally, that I ask the opportunity of recording the feelings of us American engineers and miners, generally, exiled abroad on business, and in particular, those in Spanish America. No matter how grouchy and unappreciative we may be at home, we quickly realize the comfort, privilege, and honor it is to be a citizen of the U. S. A., and to live within its confines.

There is no station or rank of life in the United States that does not shine by comparison with its similar parallel in the social organization of these countries. That is the sober opinion of one who has had considerable opportunity to observe and compare the manner of life of the poor, as well as those in easy circumstances, both here and in the States.

"Here" means seven Spanish-American countries, with an acquaintance of nine years duration. What American citizen duly appreciates the benefits of an abundant and sanitary supply of drinking-water, at the call of every home in his city? Or a healthy, varied, and nourishing food-supply in public, and in the home? Please don't smile and mention Hooverizing—there are

much worse things for the digestion that we encounter daily. No quantity of fiery *picante*, greasy *cazucla*, soggy *empanadas*, and dubious *chicha* can supplant American home-cooking, but they are what we get, willy-nilly.

Do you ever realize, you lucky Kansans and Californians, what it means to you to live in a community in which common honesty is taken for granted—honesty in all things, little and big? Where one does not have cause to regard the course of justice as subject to frequent deviations, due to the commercialization of the bench?

Who ever sees in Oregon or Iowa, a high adobe wall surrounding each private home, capped by a terrifying collection of broken glass, cemented into the top, to discourage the entrance of the constantly expected thieves and marauders? *En esta santa tierra*, theft is so common, and accepted a fact that the transportation companies unite in official warnings to the passengers against it, and he who chooses to disregard this warning is bound to regret it, sooner or later.

Did it ever occur to you that life is more agreeable amid a population which is convinced of the benefit and necessity of frequent bathing, and where high-class plumbing and bath-room fixtures are in general demand? The simple manners of these lands make it almost impossible to find a rented house supplied with a stationary bath-tub; if you wish a bath in a tub, you must supply the plumbing and the fixtures, at your own expense.

Who ever hears of typhus epidemics in the States, yet this year people have been dying by scores daily in the capital city of that South American country whose citizens have often been dubbed the Yankees of South America, for the supposed degree of advancement the term implies; and yet typhus is purely and simply a filth-disease. Typhoid fever is endemic almost everywhere, and on the high plateau regions the same is true of pneumonia and smallpox.

This is enough of material things, perhaps, though I might mention the matter of house-rents in the larger cities, which, in my own experience have called for \$75 to \$80, U. S. money per month, for a house that would find few tenants in Denver or Los Angeles, at \$16 to \$18 per month. Not one house in a hundred contains the essentials (not luxuries) of the kitchen in the average American home; frequently the meals are cooked out in the enclosed yard, at the rear of the house, even in the case of numbers of supposedly fine residences, and I have, in my own experience, sat down at table with members of the staff of British and American legations where the food was served at table by servants who lacked shoes and stockings.

What American schoolgirl or schoolboy can really appreciate the splendid American school-system, which opposes no bar to poverty or religious belief; which supplies free health inspection, free city playgrounds, and, in many cases, free school-books? Do they realize the privilege of attending schools that are the last word in modern construction, and directed by a fine body of loyal and competent American teachers? Education is not unappreciated down here, but it has had to struggle against

prejudice and jealousy in high quarters and the indifference of the ignorant.

If the native-born American has not hitherto duly realized the value of the privileges that have been his heritage, he can be sure that the European of cramped opportunity and the Spanish-American of humble station certainly do so.

Our boys who went 'Over There' with Pershing will bring back with them a new appreciation of their own land, as they have been receiving a high-speed education in national values, which will not be lost upon them. As one returning dough-boy said, "If this here place is that dear Europe, then for the Lord's sake, gimme Cedar Rapids."

Probably Congress will now provide an immigration law, with properly discriminative provisions; otherwise the States will be flooded, with a heterogeneous mass, calculated to break up and drag down our laboriously built national structure to the level of the wreckage of Europe, which will soon be seeking admission.

Spanish America is too sparsely settled and too far away, except in the case of Mexico, to furnish a current of peon immigration to the States; however, it is now the hope of every ambitious Latin-American engineer, doctor, dentist, mechanic, or commercial aspirant, to make a trip to the States "*en busca de horizontes mas amplios*, or in plain language, to locate themselves in a better position for snapping up some of those dollars, which are sneered at, but never refused, by foreigners.

Thus, if others can weigh properly the value of that marvelous development of human effort and genius, known as the United States, why cannot we, its own citizens, do so more promptly, and without cavil?

These few thoughts have been hastily jotted down *en route*, and though without finished form, they are none the less sincere, and are a part of the basis of my own unhesitating faith in the institutions of our common country, in the honesty and stability of its people and its government.

America has won the honest admiration of the world for her powerful and unselfish support of its liberty, when so lately threatened by autocratic Prussianism; it will do us good to accept this widespread conviction of our collective quality, as our own, and thus strengthen ourselves in upholding the value of American ideals.

Contrary to a general belief, the American abroad does *not* make a practice of boasting offensively of his nationality; as a matter of fact, many Europeans, and some of the South American peoples, are much more disposed to offensive self-assertion and general 'cockiness' than the American abroad.

Without prejudice to our world-neighbors, let us try to realize more fully that we have a wonderful country, with a heritage of honorable history, second to none in worthy actions; and that it is our privilege and duty to help in maintaining its democratic institutions and handing them on in safety to our children.

Arequipa, Peru, June 25.

MINING ENGINEER.

The English-Speaking Peoples

The Editor:

Sir—Being an American and having spent eleven active years in Canada, the letter of Mr. C. M. Campbell in your issue of August 9 appeals to me with particular force.

If I remember my Canadian history correctly, most of the fighting in 1812 was centred about the Niagara country, and upon the Canadian side was fought largely by British regulars assisted by French Canadians, while the United States forces were composed of irregular backwoodsmen officered by a few regulars. The battle of Stoney Creek was, I believe, a raid conducted by the American forces and was successful until a force of 600 British regulars cut off the retreat of the too exultant braves.

That battle of Stoney Creek looms large in Canadian history, and the monument, set high upon its supporting hill, looms still larger in the Canadian landscape, much too large, in fact, for the action which it commemorates. Be opinions as they may in regard to the importance of Stoney Creek as a factor in world affairs, we are confronted by the fact that the progenitors of the great mass of English-speaking Canadians were in 1812 living in Great Britain, Germany, and the United States, and played no part in the 1812 episode. At that time Upper Canada was a wilderness and only by the most far-fetched chauvinism has it been possible to glorify these backwoods squabbles into military traditions.

The industrial development of Canada has been due to the example of her big neighbor and it has been American enterprise and capital, even more than Canadian, that has enabled Canada to reach her present position. Moreover the war (?) between Canada and the United States was a fight between an exploiting imperialism and a struggling democracy, and it was the success of the United States republic which secured for Canada her own democratic institutions. The story of colonial wars has been worn threadbare and the military traditions have been blown up like a child's balloon in an endeavor to keep pace with the growth of Canada.

There has never been an American propaganda to 'annex' Canada; the habitat of that bogey lies north of the 49th parallel. The American 'invasion' of Canada has actually taken place by peaceful penetration into the North-West and has been encouraged by the Canadian government, with great benefit to Canada.

The United States has provided lucrative employment for ambitious Canadian boys who have found difficulty in securing employment at home, and the long list of successful Americans who were born and reared in Canada is a matter for mutual congratulation.

Until twenty-five or thirty years ago, Canada was undeveloped and stood on a par with South Africa, Australia, and New Zealand. The influx of American capital and the combined enterprise of Canadians and Americans have developed Canada from a colony into a nation. Canada today stands out as the only manufac-

turing dominion of Great Britain. The one industry that may lay claim to British birth and control is the Grand Trunk Railway, a glaring example of mismanagement. The moving of Canadian crops is done with American money; the promotion of Canadian industries and the sales of municipal, Provincial, and Dominion bonds depend upon American investors; the supply of semi-manufactured articles, such as skelp, wire, plate, and the like, upon which Canadian manufacturers depend, comes from the United States.

While the development of Canada is something for Canadians to be proud of, it in no way compares with the development immediately south of them. Along the southern shores of Lake Erie and Lake Ontario are conditions of prosperity tenfold greater than are found along the northern shores of those lakes. Canada has untold natural resources, but they are undeveloped largely because of the insularity which has characterized the past history of the country, an insularity inspired by a propaganda of distrustfulness toward American ambitions and ideals.

Happy the day when every man and woman born on the continent of North America shall have the right to vote anywhere upon the continent, with no other restriction than the usual residential requirements in regard to Federal, Dominion, State, or Provincial elections. I do not suggest a merging of Canada with the United States, but I do suggest that a Canadian resident in the United States should have the right to vote here, and an American resident in Canada should have the right to vote there, with no other formalities. The practice of making men forswear allegiance to one country and swear allegiance to another is a survival of a medieval custom, and has but one reason, an intention to go to war. If the United States and Canada do not intend to go to war with one another there is no reason for disfranchising a man when he crosses the boundary-line.

A short time ago I had a talk with Dr. McGillicuddy, who helped to run the 49th parallel, that mysterious imaginary wall which divides this continent in two. The greatest care was exercised in locating the line. As the survey parties approached the Rocky Mountains, the most careful determinations were made to correct the deflection of the plumb-bobs due to the influence of the mountain masses; sometimes when working with artificial horizons of mercury the work would be delayed for hours owing to ripples caused upon the surface of the mercury by vibrations transmitted from the hoof-beats of distant buffalo herds. They certainly spared no effort in exactly and precisely fixing the only barrier between the two countries.

If all of Canada stood on their side of that line and sang 'God Save the King' and all of the United States stood on our side of the line and sang 'America', there would not be the slightest discord. Any foreigner who could not understand our common language would think we were singing the same song; and so we should be; the same notes, the same ideals, and the same desire for free and enlightened political institutions.

If we could merge our most sacred political privileges, the right to vote, we should be serving notice upon Europe that the artificial enmity of the past century had collapsed. If we mutually trust one another there should be no objection to such a plan, and if we really intend to stand together in the maintenance of principles upon which we are fully agreed, and if we are both sick of the turmoil in Europe then we should start getting as close together as possible in order that no intrigue may cause a breach between us. The actual voting in one another's countries would not alter the politics of either country, but the moral effect of an interchange of voting privileges would be tremendous.

Our interests are so identical that we should get together politically as closely as we are financially and commercially, and not only work together as nations, but as individuals be at home in one another's countries, taking an interest in each other's affairs and working for the ideals in which we both believe.

And in order to further strengthen the bond, we might go beyond the exchange of political courtesies, and establish a Club of North America with branches in New York, Montreal, Buffalo, Toronto, Boston, and such other cities as might be advisable; a club in which every member would feel free to voice his opinions upon questions affecting the relations of the two countries.

A pious idea, born of the common Canadian and American tradition of burying the hatchet, might be to bury our war monuments. Let the club-building in the United States be founded upon stones taken from the Stoney Creek monument, and while we have no anti-Canadian monuments in this country, we might shed a tier or two from our Bunker Hill monument to provide corner-stones for the club-buildings in Canada.

The admission of returned Canadian soldiers who came in contact with American troops in France, that the American forces were equal to the Canadians in valor, and the testimony of the commander of the Australians that the Americans "delivered the goods" is sufficient military glory for any country. To be granted equality with the heroes of Ypres and Gallipoli should make the Stoney Creek traditions evaporate like a snowball in July.

Canadians and Americans are so identically alike in ideals, manners, and customs that they cannot recognize any differences themselves and have to ask one another what they are. In other parts of the world they are all classed as Americans; and in nine years of experience in South Africa I never knew a Canadian who could maintain his differential isolation; they would get tired of explaining to a non-comprehending audience that they were not Americans.

There is a paucity of human intelligence displayed in trying to keep open wounds that were inflicted one hundred years ago. Canadian and United States military tradition starts at Ypres and Chateau Thierry, and let us hope that it will end there. If we and Canada cannot get together, it is absolutely hopeless to expect European states to bury their differences.

Our two countries are more akin than any other two nations on earth; we think alike; we are bound together by financial, commercial, and family ties—in fact, by all the ties of advanced civilization; we understand each other and in the event of further European catastrophes we shall have to think and work together.

Let us get down to cases and make this North American continent so strong socially and politically that no European smash can affect us. We are the most constructive peoples in the world, so let us construct history in keeping with our present and future, instead of idly fondling the swaddling clothes of infancy.

San Francisco, August 12.

P. A. ROBBINS.

War Minerals Relief

The Editor:

Sir—I wish to congratulate you on the way you stirred up the so-called Minerals Relief Commission for the blundering way in which they have handled the so-called relief measure. This measure at present is causing great suffering to numerous operators of tungsten properties, who were called upon by the Government to give aid at a time when our country was in great need of tungsten.

The Act was proposed for the express purpose of giving relief to such companies as the one which I have been responsible for bringing into existence. But the result is, that while our questionnaire has been filed in accordance with instructions from Washington, and our case before the Relief Commission has been submitted under oath, we are still without the slightest bit of information as to what relief we may expect.

The Relief Act was passed for the special purpose of relief as I understand it, and not to furnish expenses for making investigations alone. If we are to receive relief, why is it that we are forced to wait until such time as our creditors are likely to swoop down upon us and take our properties from us?

My candid opinion is that while the Commissioners are sincerely desirous of ascertaining the merits of each case, they are not as conversant with the facts of the cases placed before them as they should be, even after hearing them, as to realize the great danger some of these enterprises have been driven into on account of Government stimulation.

The Pacific Tungsten Co. submits a claim for \$444,000. Any less award than the above amount will be a gross injustice to this company. I might say, in closing, that this is not a matter to be negotiated as if we were playing poker; it is a question of facts and the sooner these people are brought to realize that we are as much a part of the Government of this country as the Commissioners are, the sooner we will receive the relief we are entitled to.

Melones, California, September 2. W. J. LORING.

[The Commissioners are anxious to expedite a settlement, but the business of sifting the claims is laborious. An expert auditor has to pass upon them and the reports of the examiners have to be considered.—EDITOR.]

The Elm Orlu v. Butte & Superior Apex Litigation

By WALTER W. LYTZEN

What promised to be one of the cases most interesting to students of apex litigation, and most difficult of decision for the courts has been settled at the proverbial eleventh hour. After three weeks of testimony by the best geologists and engineers in the country, and the presentation to the Court of a set of exhibit maps and skeleton models superior to any heretofore made for litigation purposes, both sides to the suit agreed to a settlement, and asked the Court to sign the decree.

The Elm Orlu case, as it is generally known, involves the ownership of large bodies of zinc-silver ore, averaging during the years it was being mined close to 20% in zinc and 6 to 8 ounces of silver per ton, in the Rainbow lode. This broad vein system courses in a gently curving east-west direction along the northern border of the productive area of Butte, and in the early days was mined for its rich silver ore. The Rainbow lode is one of the few topographically prominent outcropping veins in the Butte district, and in places the quartz and silicified country form reef-like exposures, generally stained black with the oxides of manganese.

It was along this vein that both the Elm Orlu and Black Rock claims were located in the early days of Butte's history. Owing to its branching, and its segregated channels of ores, separated by granite only slightly altered, the true character of this vein was not understood at that time and locations rarely were made so as to have the main vein passing through both end-lines. Such was the case with the Elm Orlu and Black Rock locations, and also with the final plat as surveyed for patent. The Elm Orlu was the prior location, but the Black Rock patent was granted first. Owing to the failure of the Elm Orlu owners to adverse, the Black Rock patent included the surface areas in conflict.

From that date to about 1905, when the original Butte & Superior Copper Co. was formed, the two claims lay in friendly relationship, both being owned by ex-Senator W. A. Clark. About that time the Black Rock claim was sold to the newly formed Butte & Superior Copper Co. for \$1,000,000, together with adjoining claims belonging to other owners. The hope of this company, as suggested by the name, was copper. Its early development was disappointing and the surficial silver ore did not change to copper ore in depth. When the zinc orebodies were encountered at about 1000 ft. in depth, the venture was regarded as a failure on account of the difficulties in milling and marketing the zinc ore. But improvements in concentration, especially flotation, together with perseverance and re-organization, put Butte & Superior on the map. During 1911, '12, '13, and '14 the orebodies

increased in width as depth was gained, and laterally as drifts were extended.

Up to this time, owing to a lack of development on the upper levels, the geological structure was not understood and it was a distinct surprise when in July 1914 a suit was started by the Clark interests to obtain ownership to the orebodies in the western portion of the Black Rock mine by virtue of the Pyle branch of the Rainbow lode, outcropping within the Elm Orlu claim of prior location.

This first suit was brought in the Federal Court, District of Montana, before Judge George M. Bourquin. The decision awarded the plaintiff, the Clark-Montana Realty Co. and the Elm Orlu Mining Co., a portion of the Black Rock orebodies, the eastern limit being the decreed '301-ft. plane'. This point was where the evidence showed the Pyle branch to cross the common side-line to the Black Rock and Elm Orlu claims, and was 301 ft. south-east of the south-west corner of the Black Rock claim, as measured along the common side-line. The decision further stipulated that as to the eastward of this plane the facts as to the continuance of outcrop of the Pyle branch were unknown, and if future development should establish that the outcrop or apex or apices of the Pyle branches continued, a supplemental suit could be started and extensions farther eastward be claimed.

Judge Bourquin's decision showed a keen insight into the geological interpretation of mining law and was sustained by the Circuit Court of Appeals of the Ninth District. It was further sustained and complimented by the Supreme Court of the United States.

The suit just settled at Butte was therefore a continuance of the first suit, and, as the reserved decree stipulated, was for bringing before the Court evidence of further apexing of the Pyle branch eastward of the 301-ft. plane. The hearing had occupied three weeks, when suddenly, with all but one of the witnesses having been on the stand, a petition was presented to the Court asking for a decree based on a settlement arrived at by, and agreeable to, both sides. The hearing started on Monday, August 4, and on Monday the 25th the decree was signed.

The personnel of plaintiff's witnesses was as follows: Horace V. Winchell, James F. Kemp, Charles K. Leith, William B. Fisher, Fred Searls, Jr., and Rush J. White. The attorneys for plaintiff were John P. Gray, John L. Templeman, and Sidney Sannet. For the defendant Butte & Superior company, Albert Burch, William H. Emmons, Walter H. Wiley, Darcy Bard, Carl H. Hand, and Samuel Barker, Jr., were the witnesses; the attorneys being William Wallace, Jr., J. Bruce Kremer, and

William Seallon. The plaintiff was to call his six witnesses first and the defendant last. All the witnesses were on the stand except Mr. Burch, who was to be Butte & Superior's last witness. The cross-examination of Mr. Bard was not taken up, as it was at the conclusion of his direct testimony that the proceedings came to an end.

The proceedings started with a snap and vim that promised a course in mental gymnastics to anyone who followed the testimony and kept himself in a judicial frame of mind. The question of whether or not all development work should stop, so that the exhibits would be up-to-date without additions being made during the hearing was decided in the negative. This pleased Mr.

typical north-west veins and not uniting with the Rainbow, but of later age and therefore cutting it. Much of the testimony was to this point and naturally in this broad vein-zone that had suffered two deformations the narrow quartz-manganese mineralization of the Pyle branches was difficult to trace. The evidence points definitely to its cutting through earlier mineralization.

John P. Gray of the Coeur d'Alene opened the proceedings by briefly reviewing the findings of the former hearing and what they guaranteed to the plaintiff as to the showings of future development work. He said that since the first trial nearly six miles of drifts, raises, and cross-cuts had been driven at a cost to his side, for their

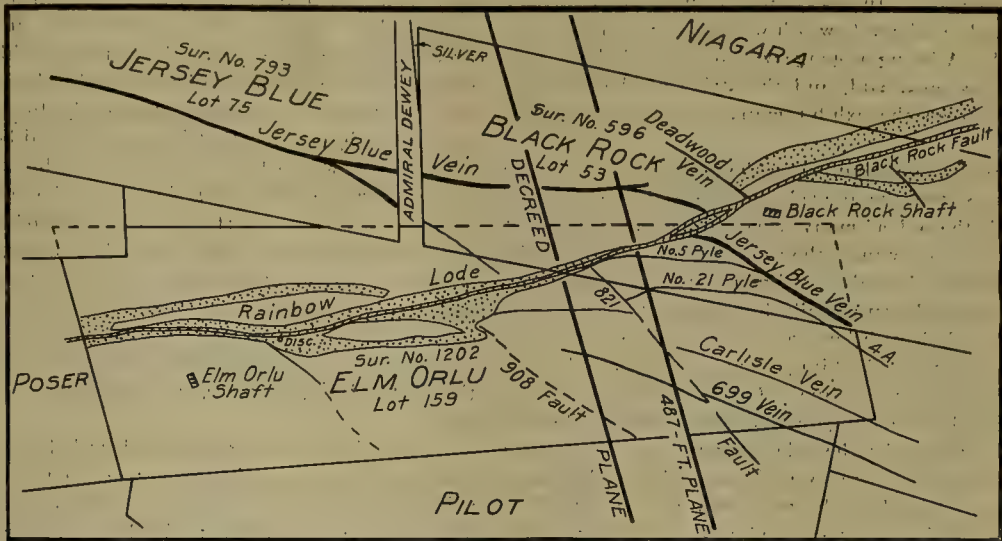

FIG. 1. PLAN OF THE ELM ORLU AND BLACK ROCK WORKINGS, SHOWING THE AREA IN CONFLICT

Kremer, who had pleaded for the continuance of work, and it was later shown that the Butte & Superior had a few places they wanted to test more fully as to vein-age relations.

It must be borne in mind by the reader that the vein system of Butte exhibits three ages of fissuring, considered in a broad and general way. They are, in turn, the east-west or Rainbow system, the north-west system, and lastly the north-east system. The younger systems fault and displace the older ones. The characteristic throw of the north-west system is to the left and that of the north-east is to the right.

A glance at the accompanying map (Fig. 1) will show a coincidence of east-west Rainbow fissuring and mineralization with a pronounced north-easterly fault-plane, called the Black Rock fault, which throws the north-westerly striking veins to the right, and at the same time obliterates the normal effect these north-westerners had on the pre-existing east-west system. This is important to remember because the '699' and Carlisle veins, claimed by the Elm Orlu side to be branching veins of the Rainbow, and to apex continuously within their claim, are regarded by the defendant Butte & Superior company to be

share, of close to \$500,000; that the work done by the Elm Orlu company had shown that branches of the Rainbow vein other than the one considered in the first hearing coursed easterly and southerly throughout the length of the Elm Orlu claim, and united and joined, both on strike and dip, with the Rainbow vein. These branches, Mr. Gray continued, were characteristic throughout the entire extent of the Rainbow vein, and the '699' and Carlisle veins were not unlike the Rainbow mineralization, varying in richness and size along their course and in depth.

The first witness for the Elm Orlu side was Rush J. White. Mr. White comes from the Coeur d'Alene, where, as engineer, superintendent, and geologist, he has had a broad training. Mr. White was prominently connected a few years ago with the Star apex litigation near Burke, Idaho. His connection with this case started in December 1917, when, at the untimely death of Fred Greene, he took charge of the development work for the Elm Orlu Mining Co. in preparation for this suit. As he had been in almost daily contact with the work, and had had an opportunity to examine the rock-structure when freshly broken, his direct testimony was very valuable. Mr.

White described in detail the various development openings driven by his side and the geological structure disclosed. The '699' and Carlisle veins were traced in the different drifts and raises, and his notes as to the widths of mineralization and of the altered granite were given in detail. It was apparent that, with the exception of the more northerly Pyle branches, the veins apexing within the Elm Orlu claim, upon which the plaintiffs hoped to establish their right to the Rainbow orebodies, were very narrow and often interrupted by faulting.

Quartz and manganese minerals alone constituted the material brought in, and only by claiming undue portions of altered granite could the veins be classed as of recognizable size. In many places quartz was entirely lacking and in others its width was measured in fractions of an inch. A lining of gouge was to be noted along these veins, the witness said, and the strike of the veins, as readily seen on the exhibit maps, was strongly north-west.

The various raises put up on the branching veins were followed up from the alleged junction with the Rainbow vein, with the aid of many separate raises on different planes. In two instances the raises not only followed the dip inclination, but also, inclining strongly to the east as they ascended, were finally brought up to the surface or to adits slightly below the surface. The reason for this was that many buildings, housing hoists and other necessary operations connected with a going concern, would have been endangered by continuing to the surface. The reason for the side inclination to some raises was given as the desire to avoid some faults that were due to pass through if the raise was put up normal to the strike. This, and the use of raises not continuously in one plane, was vigorously attacked by the Butte & Superior counsel in their cross-examination of Elm Orlu witnesses. The section maps of the plaintiff were on planes parallel to the Elm Orlu end-lines and at quite an angle to the strike of the veins. Necessarily, in making these sections, it was necessary to resort to projection.

The cross-examination of Mr. White was not so much to make his testimony contradictory, as to emphasize the smallness of the real mineralization and its lack of continuity by much north-west structure, and the latitude the geological projection allowed in making the vertical sections.

It was a disputed point all along as to which structure should have been followed when branching or splitting occurred. One raise in particular on the '699' vein, which the Butte & Superior side claimed to be vertical, was carried down by the plaintiff by following all north-dipping splits and ultimately coming on the Elm Orlu 1000-ft. level in the vicinity of the Rainbow vein. Testimony later by the defendants tended to show that by cross-cutting south on several levels a vein was picked up on each, that correlated exactly with the upper 400 ft. of the vein followed by this raise. The defendant's contention was that much of the alleged continuity of these branch veins was due to the fact that a person

starting at the apex of, say, the '699' vein, even at the most easterly opening, could descend through Elm Orlu raises for certain distances, then by a drift connection to the top of another raise, and so forth, finally arrive at the alleged junction of these branching veins with the Rainbow. The contention was also that the physical connection was only possible by using all three ages of geologic structure and evidence was pointed out by defendant's witnesses to uphold this interpretation.

This branching on strike was interpreted by each side differently and what, on direct testimony by Elm Orlu witnesses, appeared to be a nicely behaving and continuous vein, continuing to and joining with the Rainbow vein, was quickly separated into its alleged components by cross-examination. Naturally, in this small area three successive ages of fracturing would produce a complex fissure that would branch and re-branch. Many of these fractures would stop apparently, to be continued on the side by another that in reality would be the same. This was shown to be actually possible by Mr. Searles, witness for the Elm Orlu side, when he introduced a block of wood to support his explanation of the branching. The block had been struck a hard blow, and along the grain a fissuring was set up that both branched, and apparently stopped, only to continue again to one side. Mr. Bard, for the defence, introduced a piece of plate-glass that illustrated this same effect. The intention of this last exhibit, however, was to support the opposite view.

Mr. Bard, in defining the Rainbow lode, said that the various channels and branches need in no way be considered as a unit; that each piece of the vein was distinct and separate, and if being mined by a miner would not present evidence to justify him in cross-cutting the walls in the hope of finding another similar structure. But it is to be noted that the Butte & Superior has cross-cut the walls and found similar structures, and stoped thousands of tons of rich ore from them.

The foregoing illustrates how widely at variance were the views held by the two sides. All through the testimony the interpretation put on certain structures was as far apart as is possible to conceive.

The map-exhibits, for instance, prepared for both sides from the same surveys, showed no apparent discrepancies in outline, but the Elm Orlu maps with their broad red bands contrasted sharply with the modest red coloring on the Butte & Superior maps. The difference depended upon how much altered granite each side deemed permissible in estimating the widths of the veins. The plaintiff naturally emphasized the homogeneity of the vein-structure, whereas the defendant clung to Mr. Bard's theory of separateness and individuality of the branches. Mr. Kemp, professor of geology in Columbia University, witness for the Elm Orlu side, after stating his belief as to the No. 5, '21', '699', and 'Carlisle' veins being branches of and uniting with the Rainbow, was cross-examined by Mr. Wallace. The lack of gouge in places and of quartz in others did not destroy the continuity of the vein, said Mr. Kemp, who likened the vein to wall-paper with nu-

merous holes in it. The vein, regardless of the holes, could be followed, and was continuous. As to the intervening granite of the broad Rainbow lode being pyritized and therefore indicative of vein formation, the Professor replied that the granite here upon analysis contained

construction are deemed part of the vein and by the defence are held to be country. Mr. Wallace asked Mr. Kemp if a 'horse' might be in the Shetland or Percheron class, or even stretched to the elephant class, whereupon the witness replied that he would limit it.

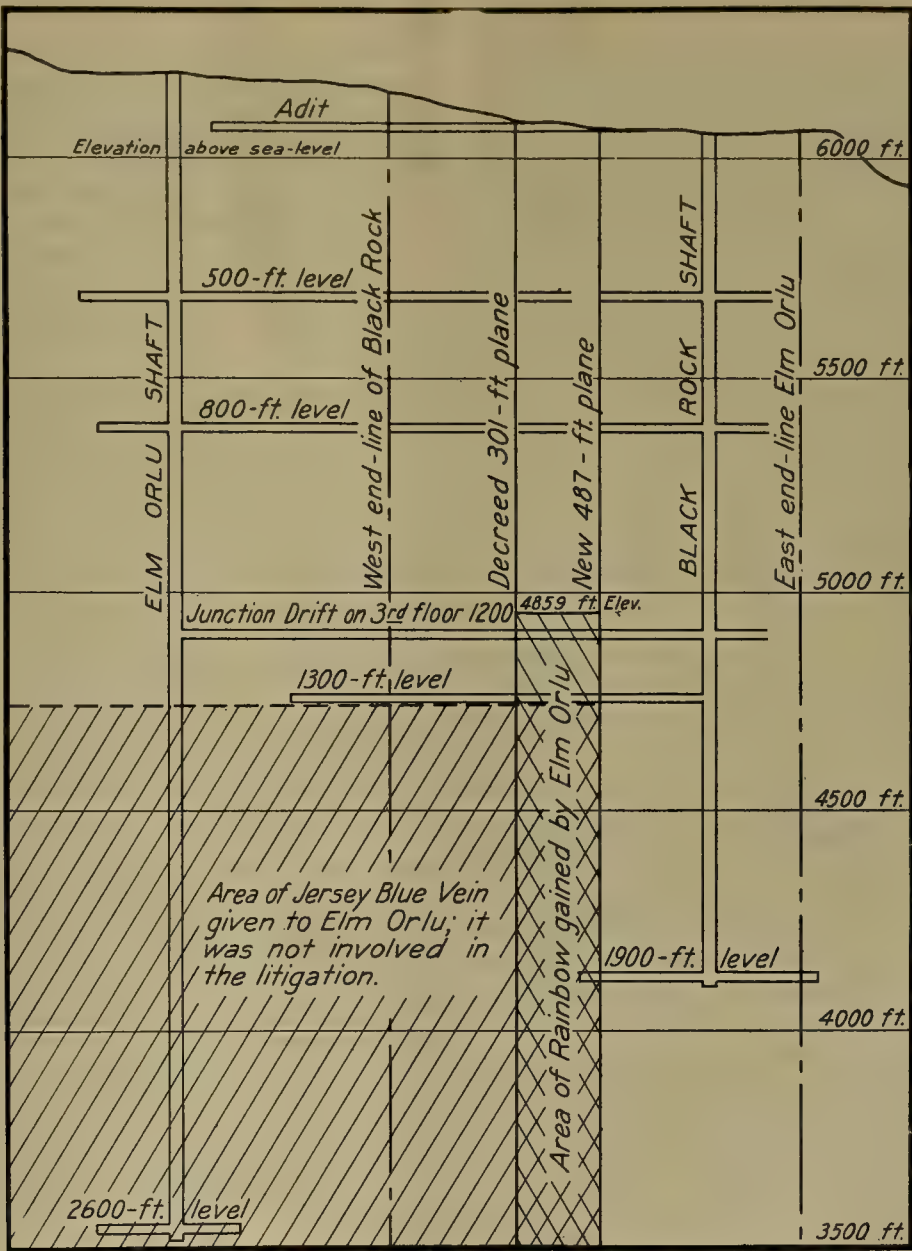

FIG. 2. EAST-WEST LONGITUDINAL PROJECTION SHOWING THE AREA IN CONFLICT

nearly twice as much sulphide as other typical analyses of Butte granite. The question how large a 'horse' could be and yet be called a 'horse', was finally limited by the witness to a length of 400 ft. Between the channels of ore are large elliptical masses of granite, in places pyritized and hydrothermally altered, that by the plaintiff's

Mr. Leith of the University of Wisconsin followed Mr. Kemp. Mr. Leith defined a vein as having five necessary elements: (1) mineralization, as quartz, manganese, zinc, etc; (2) mineralized granite; (3) gouge; (4) one or more walls; and (5) a banded or sheeted structure. Ordinarily, the witness said, it was necessary to have more

than one element to constitute a vein. On cross-examination by the defence he was closely questioned as to pyritized granite alone constituting a vein, the plaintiff having claimed much of this material, especially where altered, as 'vein'. Mr. Leith said he would hesitate to follow such granite as a vein unless bounded by a wall and a continuation of at least some quartz mineralization. Mr. Kremer questioned the witness as to widths of pyritized granite allowable within his conception of a vein, and was answered 10 feet.

It was noticeable all through the testimony that the Elm Orlu side wished to include the altered granite in the lode-structure, whereas the Butte & Superior endeavored to limit veins to 'brought in' material, such as quartz and manganese. The question of assay-values in zinc, lead, or copper was mutually avoided on account of the accepted fact that 'commercial' ore only began at about the horizon of the alleged junction. The main point of the suit, on the part of the plaintiff, was to establish a continuity of vein between the apices of the various Rainbow branch-veins contained in their claim and the main Rainbow orebodies as developed by the Butte & Superior company. Naturally the defendants tried to show by their development in this same area that the veins used by the Elm Orlu company were not continuous, but segments of veins, and the main structure followed was of later age and of a different type of mineralization.

Mr. Emmons, professor of geology in the University of Minnesota, witness for the defence, gave clear and instructive testimony along this line. His statement that the east-west Rainbow type of vein was pre-eminently a replacement, and the north-west veins the results of a fissure-filling process, got him into trouble on cross-examination, when Mr. Gray read from one of Mr. Emmons' recent books, 'Principles of Economic Geology', that both east-west and north-west veins were of the replacement type. The importance of this lay in the fact that the witness claimed to be able to distinguish, by the massive or mottled appearance of the replacement type, between the east-west veins from the north-west veins, which he claimed had a banded structure from the nature of their formation.

Much of Mr. Emmons' testimony was a description of vein-structure and consequent identification of the different veins as of one age or the other; so in the cross-examination the temptation was too strong for Mr. Gray to resist referring to the book. Mr. Emmons proved equal to the occasion, however, and answered Mr. Gray that in a book like this, devoting only a few pages to a general description of a district, the big important features only were treated, and he could hardly be expected to describe such insignificant veins as the '699' and Carlisle. The witness followed through the development openings and showed how in his opinion the plaintiff had utilized veins of different ages to establish continuity and likened some of their raises to highly inclined cross-cuts.

The other witnesses in their testimony followed the

same general trend. The branches that make up the '699' and Carlisle veins on the Elm Orlu exhibits were colored red; and the same veins on the Butte & Superior maps, blue. This blue coloring indicated north-west veins and more closely approached the interpretations of age relationship as shown by the maps used in the first trial.

After eleven witnesses had been heard the color carried mentally by an impartial observer was a hazy purple. One thing was apparent. The so-called 21 branch of the Pyle vein was of Rainbow age and did not continue east of the 301-ft. plane. Testimony and actual development showed that it crossed the common side-line 186 ft. beyond the decreed plane. Where 4A is marked on the map, the plaintiffs contend it swings south-easterly into the Elm Orlu claim again, but the defence maintained this was a vein of later age that cut the '21' vein. No matter now, however: the suit was settled on the 21 showings.

The Butte & Superior company granted the Elm Orlu the 186 ft. additional eastward extension of the ownership of the Rainbow vein below a horizontal plane, the elevation of which is 4859.50 ft. above sea-level, or in terms of mine workings, the third floor of the 1200 Black Rock. This was called, by the plaintiff, the junction drift. Furthermore, the Butte & Superior company gives to the Elm Orlu company the ownership of the Jersey Blue vein westward of this new 487-ft. plane to the west end-line of the Jersey Blue claim, below a sea-level elevation of 4740 ft., or the general elevation of the 1300 Black Rock. In return, the Elm Orlu company returns to the Butte & Superior company the \$314,450 that was put up by them as settlement of the first trial.

What the settlement will cost the Butte & Superior is not known definitely. That there was a payment in money is strongly suggested in the decree as signed by both parties and the Court, for it says: "By the way of supplemental and final decree, it is further ordered, adjudged and decreed that as the parties have settled all money claims as between themselves, therefore, etc." This, in connection with persistent rumor, would indicate that some money consideration played its part. Two and a half million dollars is the sum mentioned.

The preparation for this suit and the three weeks of hearing represent a vast amount of work and the cost in money runs up to a large sum. Witnesses and attorneys gathered in Butte from Los Angeles, San Francisco, Seattle, Wallace, Minneapolis, Madison, and New York. The testimony as transcribed makes 17 volumes of 235 pages each.

EXPERIMENTS on the recovery of tungsten from concentrates have been made by H. W. Hutchin and L. J. Meade, who found that a strong solution of caustic soda acting on uncalcined material effected a complete extraction of WO_3 . Calcining the concentrate first rendered the extraction incomplete. Dilute solutions of caustic soda were ineffective. The economic success of the process, however, appears doubtful, and further experiments have therefore been suspended.

Diesel Engines in Mine Power-Plants

By C. LEGRAND

Late in 1912 the Phelps Dodge Corporation decided to test engines of the Diesel type in practical service under the conditions existing in mine power-plants. Engines of fairly large capacity were not then made in this country, so that two engines were ordered from Belgium in 1913. Owing to delay in shipment, the first engine was not put in service until December 1914, and the second in about March 1915. These engines were installed at the Burro Mountain branch of the Phelps Dodge Corporation, at Tyrone, New Mexico, at an elevation of 5950 ft. above sea-level.

The engines are of the vertical two-cycle type, with five cylinders, 20.6 in. diameter and 26 in. stroke, running at 180 r.p.m., and rated at 1250 b-hp. at sea-level. The engines have water-cooled pistons, cross-head slides, cylinder-heads, and exhaust-pipes. They are equipped with cross-heads instead of the more usual trunk-pistons. This increases the cost of the engine, but was considered justifiable from the operating point of view.

The fuel is injected into the cylinders by compressed air, and the air-compressor for this work is direct connected to the engine. The same compressor furnishes compressed air for starting the engine, this air being stored in two air-bottles under a pressure of 1000 to 1100 lb. per square inch. The fuel-oil has to be filtered before being used, as sand is very destructive to the fuel-pump valves, which work under pressure up to 1000 lb. per square inch.

The scavenging pump is sufficiently large to maintain a pressure of two or three pounds in the cylinders of the engine at the beginning of the stroke, and in this way restores approximately sea-level conditions of pressure in the cylinders, giving the same power to the engine less the extra work performed in the scavenging pump. The initial pressure in the cylinders is varied accordingly with the barometric pressure at the point where the engines are used. This method increases the fuel consumption per available horse-power, but unless the fuel-oil cost is very high, it gives a cheaper total cost if the decreased investment is taken into consideration.

Although the two-cycle engine has a higher fuel consumption than the four-cycle engine, the cost per horse-power of engine installed is less; it eliminates the exhaust-valve, which is a source of trouble, especially with oil containing sulphur, and replaces this valve by the scavenging valves, which handle only clean air instead of hot gases. The two-cycle engine is more complicated and probably has a higher repair cost than the four-cycle engine, although it is difficult to obtain figures on comparable operating conditions and sizes of engines. It is also difficult to get information on the relative reliability

of the two types of engines and on what percentage of the time they are fit for service, but there is no doubt that with both types it is necessary to have spare units to attend properly to the maintenance of the engines if continuous service is needed.

The service given by the first two engines was satisfactory, and two additional engines, built in this country, were put in at the plant of the Burro Mountain branch, two at the plant of the Morenci branch at Morenci, Arizona, and a third one is being installed at this plant; one at the Old Dominion Co.'s plant at Globe, Arizona, and two at the Moctezuma Copper Co.'s plant, at Nacozari, in Sonora, Mexico. All of the above are direct-connected to 60-cycle alternators of 815 to 850 k.v.a. capacity. In addition, an air-compressor of 4000 cu. ft. per minute capacity, driven by a three-cylinder engine with the same size cylinders as the five-cylinder engines, has been running at the plant of the Burro Mountain branch for the last 18 months, and a 6400 cu. ft. air-compressor, direct-connected to a five-cylinder engine, should be running in Morenci by the end of August.

On these compressors the speed of the unit is controlled by the air-pressure, and on the one in service there is no difficulty in getting an automatic range of speed from one half to full speed—the full speed being 180 r.p.m.

The running of the compressor units has been satisfactory, as is shown by the cost of compressed air. For the whole year 1918 the costs at various plants of the Phelps Dodge Corporation, per million cubic feet of free air compressed to 90-lb. gauge, figured on equal cost of fuel and water, were as follows:

| | |
|--|---------|
| Bisbee plant (output 5913 million cubic feet)..... | \$25.64 |
| Globe plant (output 2986 million cubic feet)..... | 27.49 |
| Tyrone plant (output 860 million cubic feet)..... | 15.85 |

Year 1919 (four months with increased fuel costs):

| | |
|--|---------|
| Bisbee plant (output 1804 million cubic feet)..... | \$36.25 |
| Globe plant (output 664 million cubic feet)..... | 37.23 |
| Tyrone plant (output 464 million cubic feet)..... | 15.53 |

These costs are running costs, and do not include taxes or general expenses, but they include supervision as well as labor, fuel, lubricating oils, repairs to complete plant, supplies, water, and lighting.

The Bisbee compressors are 7000 cu. ft. units, driven by triple-expansion Corliss condensing steam-engines, using super-heated steam, and have a steady load, as we have a hydrostatic air-storage to equalize the demand on the power-plant. At times we have to use 3500 cu. ft. compressors driven by Corliss compound-condensing steam-engines.

The Globe compressors are all driven by cross-compound Corliss condensing steam-engines, using super-

heated steam, and varying in size from 2000 to 5000 cu. ft. per minute. Both plants have boilers equipped with economizers, and use oil as fuel.

The apparent anomaly of reduced costs at the Tyrone plant with increased cost of fuel is due to the increased output as well as the decreased general repairs to the plant. The total charge for labor on the plant is divided proportionately to the number of cylinder hours of service of the compressor and power engines, and not to the power delivered, so that with a larger output of air the labor charge per 1000 cu. ft. diminishes. In our steam-plants the labor is divided among various engines in proportion to the steam used. To make the two figures absolutely comparative, we should charge the labor on Diesel engines in proportion to the fuel used. This would decrease the cost of air at Tyrone in 1918, and increase it slightly for 1919. The cost of labor at the Tyrone plant was \$5.02 per million cubic feet in 1918, and \$3.70 in 1919.

The fuel-oil used in our Diesel engines is the same as we use for the boilers in steam-plants. It has varied in gravity from 14 to 20°B., and at times has contained over 2% of sulphur. The oil has to be heated so as to flow freely in the fuel-pumps and go through the filter. This is done by means of the circulating water of the exhaust-pipes, as the temperature of this water can be varied without danger to the engines.

A few minutes before shutting down an engine, the fuel-oil is changed to a 24°B. oil, so that the fuel-pump piping is completely filled with light oil before the engine stops. In starting, the same oil is used until the heavy oil has time to warm up. No adjustments on the engine are necessary when changing fuel-oil.

The result of our experience is that repair costs are heavy and are a large part of the running costs. These repair costs can be divided into two classes: those which consist of regular inspection and renewal of parts to avoid trouble when the engine is in service, and those which happen at irregular intervals regardless of the attention given to the engine.

In the first class I would place the piston-rings, the scavenging valves, the atomizers, the air-compressor valves, the water-connections for piston-cooling, the mechanical adjustments of bearings, gears, etc. In the second class, the head cracking, piston cracking, cylinder-liner cracking, and unforeseen accidents.

The regular and conscientious inspection of the various parts of the engine at fixed intervals, to be determined by experience, renders the engine reliable in service. The easiest way to care for the inspection of such parts as atomizers, scavenging and air-compressor valves, is to replace them by duplicate parts and put the parts removed in first-class shape to go back on the engine at the next examination. Our experience shows that it is cheaper to do this examination than to wait until a part gives trouble, as when this happens there is usually a sudden and costly shut-down, and the troublesome part has to go to the scrap-heap.

The condition of the piston-rings can be determined

by indicating the engine, and if compression begins to fall, immediate attention should be given to the piston-rings. Once the engine is down to its bearings, a fall of compression is due to faulty piston-rings, or to the cracking of a head or piston. Leaks in valves will burn them out in a few minutes, and show themselves forcibly to the attention of the operator.

The scavenging valves have given no trouble when inspected and ground every two months. It may be possible to extend this to a longer period, as we have operated some of them over six months without attention, but we prefer to keep on the side of safety.

With oil properly filtered, the fuel-pump valves do not give much trouble. They should be re-ground and kept in first-class shape. The intervals between grinding depends mostly on the cleanliness of the oil.

The gears driving the cam-shaft gave some trouble in the first engines, but they are now satisfactory and do not require frequent adjustment.

The greatest cause of trouble has been the air-compressor valves. The Belgian design was a balanced poppet valve, mounted between two springs. These were satisfactory, but required careful adjustment, and during the War we found it impossible to get springs that would stand the work. These valves have now been replaced by plate valves. We still have some trouble in getting suitable material for the valve-plates, but this should now be obviated.

The main bearings have given no trouble, and they are not adjustable for wear.

The crank-bearings and cross-head shoes require less attention than they do on a steam-engine, as they are of generous size.

The water-cooling system gives little trouble, but care must be exercised in erecting the connections for water-cooling of pistons, to ensure that the water is delivered at the proper point in the piston. The water used for circulation should have as little scale-forming matter as possible, as a little scale will reduce the life of heads and pistons considerably. In most localities the water should be treated, and where cooling-towers are used, a certain amount of the water should be wasted to prevent concentration of salts in the circulating water.

The greatest source of expense for repairs has been the cracking of the heads, although this causes practically no interruption of service. The heads crack when the engine is stopping, and if the cracks are not large enough to prevent the engine starting, through loss of compression, they take up in a few minutes after load is put on. However, we found it inadvisable to keep cracked heads in service if they leak water in the cylinders when the engine is not running, as the rust formed on the cylinder-walls wears them out rapidly. Water cannot leak into the cylinder when running, as the inside pressure is always greater than the water-pressure. The cost of head repairs has been considerably reduced by making the head in two parts, and will be further reduced by getting the proper material for the portion exposed to the heat. We have as yet not obtained, in this

country, heads that stood as well as the original heads on the Belgian engines.

The cracking of the piston is not so serious, and can usually be traced to some defect in the water-cooling system or defective castings.

The fuel consumption of the engines under test conditions is shown in the appended curve. The actual consumption does not vary more than 2 or 3% from that shown, even with variable load. The only time fuel consumption increases is when engines are allowed to run with leaky piston-rings, so it is advisable to keep daily records of fuel consumption.

The consumption of lubricating oil varies from 5 to 6 gallons of cylinder-oil per 24 hours, and is practically independent of the load. This oil consumption is the total oil used on the engine, and includes bearing lubrication, for which we use the same oil as for cylinders.

the plant was started. The same cost at Morenci for the first five months of this year has been \$11.25, and this I expect can be maintained through a period of years if we can obtain a better load-factor on the engines and after we have a spare engine.

The operating data on the Morenci plant for the first five months of this year follow: (The month of August 1918 is added to show the effect of load-factor on plant efficiency).

| | August 1918 | 1st 5 months 1919 |
|--|----------------|----------------------|
| Rating of engine | 800 kw. | 800 kw. |
| Average load on plant..... | 701 kw. | 798 kw. |
| Average load per engine (based on running time) | 692 kw. | 456 kw. |
| Load-factor | 86.5% | 55.7% |
| Average load for auxiliaries..... | 11.4 kw. | 13.5 kw. |
| Average load available | 681.6 kw. | 442.5 kw. |
| Pounds fuel-oil per kw-hr. generated..... | 0.681 | 0.776 |
| Pounds fuel-oil per kw-hr. available..... | 0.694 | 0.798 |
| Kilowatt-hours available per bbl. of oil (325 lb.) | 468 | 407 |
| Lubricating oil per engine-hour..... | 0.216 gal. | 0.204 gal. |
| Cost per available kw-year..... | | \$94.319 |

THE DIESEL ENGINE IN USE AT TYRONE, NEW MEXICO

At the Tyrone plant we use machine-oil for bearing lubrication, but the quantity needed is greater and it does not decrease the cost of lubrication.

We gained our experience at the Tyrone plant, and the cost of this experience is reflected in the repair cost to the plant, which averaged \$28.50 per kilowatt-year available (available kilowatts are the total generated less power taken for auxiliaries and lighting of plant) since

| | |
|--|---------|
| Divided as follows: | |
| Supplies (includes lubricating oil)..... | \$3.324 |
| Water (15 1/2 c. per 1000 gal.)..... | 0.820 |
| Fuel-oil | 62.362 |
| Repairs | 11.255 |
| Proportion at power-house: | |
| Labor | 13.583 |
| Supplies | 0.488 |
| Telephones | 0.154 |
| Hauling | 0.059 |
| Repairs | 2.013 |
| Fire insurance | 0.132 |
| Sundries | 0.129 |

In these costs the operating labor includes a proportion of the master mechanic's salary. Repairs include all material and labor; the shop labor includes overhead charges for supervision. The proportion of power-house repairs includes all repairs to buildings and general equipment not used exclusively by Diesel engines.

In analyzing these costs and comparing them with steam-plant costs, the load conditions have to be taken into consideration. On Sundays the average load is about 100 kw., while on week days we have peaks lasting several hours with over 1200 kw. load.

Comparing this plant with a turbine plant that would handle the same load, there would be a reduction of the cost of supplies, although this would be small, as the boiler-room supplies would have to be included.

The water would cost approximately five times as much.

The fuel-oil $2\frac{1}{4}$ to $2\frac{1}{2}$ times as much.

The repairs would be reduced to about one-third.

The operating labor would be a stand-off.

In conclusion, I am of the opinion that for plants of moderate capacity, and where fuel is expensive, the Diesel engine has a good field, but it is necessary to handle it with due regard to its limitations.

The above information is given through the courtesy of the Phelps Dodge Corporation, which allowed its publication.

INSPIRATION COPPER CO. has been able to effect a somewhat lower production cost than prevailed last year, due to the wage cut of six months ago and lower prices for materials. The company did not earn, however, in the past six months the dividends paid. With a monthly yield of 6,000,000 lb. of copper, Inspiration has been running about one-half capacity. It has been exceedingly difficult to get sufficient men in Arizona and much of the available labor has been inefficient. An experimental plant for treating oxidized ores, of which Inspiration has a considerable tonnage, has been completed. The latest estimates indicated that the company had 17,500,000 tons of ore averaging 1.31% copper. This material will be tried in a leaching process. If successful, an addition to

the equipment will be made. At the beginning of the year Inspiration had on hand 28,000,000 lb. of unsold copper, but recent sales have cut into this.

Future of the Belgian Zinc Industry

The Bureau of Mines has published a special report on the zinc industry in Belgium, by March F. Chase. The principal reason for the smelting of zinc ores in Belgium, before the War, was the fact that the country had an abundance of cheap skilled labor, the proper quality of clay for retorts, cheap coal, and cheap water transportation. Of these four factors, probably the most important was labor. The past four and a half years of enforced idleness, together with the removal of many of the workers from towns near the smelting plants, has resulted in a thorough disorganization and demoralization of labor, and its effects will be felt for some time in the industry, both in the efficiency of the operations and in the cost. The future of Belgium as a zinc-producing country is not particularly bright, but the relative position it will occupy from now on is not easily predicted. It is rather certain that for some years to come production will be far below pre-war figures and may never reach the 1913 level. The rehabilitation of the industry, even to a limited extent, will depend upon the obtaining of prompt and reasonable supplies of ore. If these are not promptly provided, the greatest asset that Belgium had—that is, the skilled workmen—will be lost, as these men undoubtedly will seek employment either in other countries or in other industries. The smelting capacity outside of Belgium has been so vastly increased that it can easily take care of the world's requirements, and the only Belgian plants that can hope to compete successfully are those that are in a position to operate on low cost and high recovery. The present cost of coal will no doubt come down, but the political and commercial control of the primary raw material, being outside of Belgium, will always work against the continuance of the industry. One factor that will be helpful, however, will be a profitable market for the by-products. This may compensate to a considerable extent for the disadvantages under which the industry will otherwise be in its efforts to rehabilitate itself. Aside from commercial considerations, the present physical condition of the plants will tend to retard the resumption of operations. During the last two years of the occupation, the idle plants suffered largely through lack of maintenance, and from equipment of all kinds being removed. Naturally there was some distinction made in the character of material removed from the plants that were German owned, and those owned by Belgians. The former operated to a limited extent during the entire period of occupation and are in fair shape to resume work on an extensive scale. The Belgian engineers have contributed largely to the metallurgy of zinc, and although they are now handicapped in many ways, it is entirely possible that they will be able to meet the situation and restore the industry to a fair proportion of what it was before the War.

A Federal Department of Public Works

Text of the bill (Senate 2232) to create such a department and to define its powers and duties:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled:

SECTION 1. That the name of the executive department now designated as "Department of the Interior" be changed to the name "Department of Public Works", and that the head thereof shall continue to be a member of the Cabinet under the official designation "Secretary of Public Works", to be chosen and confirmed as in such case now provided by law, except that when the present occupant shall vacate that office all subsequent occupants shall by training and experience be qualified to administer the affairs of the Department and to evaluate the technical principles and operations involved in the work thereof.

SECTION 2. That all the powers, functions and duties, executive and administrative staff, personnel and property, and all bureaus and other instrumentalities now vested in, a part of, or belonging or subordinate to, the Department of the Interior, be in like manner and to the same extent continued in the Department of Public Works, except as hereinafter provided.

SECTION 3. That the following bureaus and other instrumentalities now subordinate to the Department of the Interior shall, with all their functions, personnel and property and all boards, commissions, or agencies pertaining thereto, be transferred as herein specified:

A. The Patent Office to the Department of Commerce.

B. The Bureau of Pensions to the Department of the Treasury.

C. The Bureau of Education to the Department of Labor.

D. The Bureau of Indian Affairs and the Board of Indian Commissioners to the Department of Labor, PROVIDED: That the engineering and construction work and the land and mineral surveys now performed by, or under the direction of, the Bureau of Indian Affairs shall be prosecuted under the Department of Public Works.

E. The St. Elizabeths Hospital and the Freedmans Hospital, to the Public Health Service, Department of the Treasury.

F. The Columbia Institution for the Deaf and the Howard University, to the Bureau of Education, Department of Labor.

SECTION 4. That the following bureaus and other instrumentalities now subordinate to the departments in each case designated, with all their functions, personnel and property, and all boards, commissions or agencies pertaining there to be transferred to the Department of Public Works:

A. The Supervising Architects Office, now subordinate to the Department of the Treasury.

B. The Construction Division of the United States Army, River and Harbor Improvements, the Mississippi River Commission and the California Debris Commission, now subordinate to the Department of War, PROVIDED: That the engineer officers of the United States Army detailed to the non-military duties having to do with River and Harbor Improvements, the Mississippi River Commission, and the California Debris Commission, shall be detailed by the Secretary of War to like duties under the Department of Public Works for such period, not exceeding two years, as the Secretary of Public Works may find necessary to make gradual transfer of said improvements and instrumentalities to civil administration without detriment to the public interest; that upon such transfer to civil administration, said engineer officers of the United States Army shall be returned to military duties; and PROVIDED FURTHER: That for the purpose of acquiring instruction, training and experience, members of the Corps of Engineers, United States Army may, with the consent and approval of the Secretary of Public Works, be detailed by the Secretary of War for temporary duty under the Department of Public Works and shall be assigned by the Secretary of Public Works to such duties as may be deemed best adapted to the purposes of such detail.

C. The Coast and Geodetic Survey, and the Bureau of Standards, now subordinate to the Department of Commerce.

D. The Bureau of Public Roads and the Forest Service, now subordinate to the Department of Agriculture.

SECTION 5. That all officers of the United States Army attached to the Department of Public Works shall retain their military rank and succession and receive the compensation, commutation and emoluments provided by law in the case of Army officers of the same rank not detached from regular army service.

SECTION 6. That pending further action by Congress all personnel, appointments, tenure and compensation under the Department of Public Works shall, except as otherwise provided herein, continue under the laws now in force in the several bureaus and other instrumentalities retained in or transferred to said department under this Act.

SECTION 7. That there shall be four Assistant Secretaries of Public Works appointed by the President with the advice and consent of the Senate, each of whom shall be specially qualified by training and experience for the particular services over which he may have jurisdiction, and who shall be removed from office only for inefficiency and for conduct detrimental to the service, on charges duly made and adjudicated in accordance with law in such case provided, or for age or physical or mental impairment, and that each of said Assistant Secretaries shall be paid a compensation of \$7500 per annum; that said Assistant Secretaries of Public Works shall be included within the scope of any civil service retirement laws now or hereafter enacted by Congress and the regulations thereunder; that one Assistant Secretary shall have administrative jurisdiction over all matters of en-

gineering design and construction, by whatever bureau or other instrumentality of the Department performed; that one Assistant Secretary shall have administrative jurisdiction over all architectural work and construction, by whatever bureau or other instrumentality of the Department performed; that one Assistant Secretary shall have administrative jurisdiction over all scientific work and surveys, by whatever bureau or other instrumentality of the Department performed; that one Assistant Secretary shall have administrative jurisdiction over all land and legal matters, by whatever bureau or other instrumentality of the Department performed; that said four Assistant Secretaries shall, under the direction of the Secretary of Public Works, co-ordinate and bring into efficient relation all of the functions included in this section to the end that the work of the Department shall be harmoniously and most economically performed and administered.

SECTION 8. That all acts or parts of acts inconsistent with the terms of this Act are hereby repealed, and the Secretary of Public Works is authorized to perform any and all such acts and to make such rules and regulations as may be necessary and proper for the purpose of carrying the provisions of this Act into full force and effect.

Mining in Nevada in 1919

The high price of silver and the discovery of rich gold-silver ore in the Divide region, in Esmeralda county, have added materially to the interest in mining in Nevada. It is not probable, however, that the output of gold and silver in 1918 will be exceeded in 1919, and it is nearly certain that the output of copper, lead, and zinc will be much less.

GOLD. Gold is found in all the counties of the State, but most of the output comes from mines in Esmeralda and Nye counties. The output from the Goldfield district, formerly the largest producer, has been rapidly growing less from year to year. The production in 1917 was \$1,900,082, and in 1918 it was only about 60% of that amount. In 1919 the Goldfield Consolidated is being worked by a leasing company, and rich ore has been opened in the Florence mine. The output of gold from Tonopah is not decreasing so rapidly. The district was credited with \$1,539,529 in 1917 and about 80% of that amount in 1918. There was some improvement in the production of gold from the Comstock region in 1918 over 1917, and it is hoped that the total will be upheld in 1919, for the price for the associated silver is much better. In Elko county the Elko Prince continues to be an important producer, and the Elgoro mine, at Jarbidge, became a large producer in 1918, and has prospects of a greater yield in 1919. In Mineral county the Olympic and Aurora mines were productive, but the Aurora was closed at the end of 1918. Much gold comes from the copper ore of the Nevada Consolidated property at Ely, but the shipments from this source were curtailed in the first half of 1919.

SILVER.—The output of silver in Nevada has been de-

creasing during the last few years. In 1917 it was 11,269,969 oz. and in 1918 about a million ounces less. Mines of the Tonopah district produced 8,734,726 oz. in 1916, 7,068,737 oz. in 1917, and about 6,000,000 oz. in 1918. The Tonopah-Belmont, West End, and Tonopah Extension mines are maintaining good production, but the shipments from the district indicate a general decrease. The shipments from the Comstock district may improve somewhat in 1919, as rich ore has been opened at depth. The mines at Rochester produced 799,871 oz. of silver in 1917 and slightly more in 1918. There has been a decided boom at Divide, where much ore similar to that at Tonopah has been developed. It is hoped that this discovery may in the future offset the decreasing gold and silver production of other districts in Nevada. At present from 200 to 400 tons of milling ore is being shipped each week.

COPPER. The production of copper in Nevada was 122,794,704 lb. in 1917 and about 105,000,000 lb. in 1918. There will be a decided decrease in the output of copper in 1919, as the Mason Valley smelter was closed in February and the Nevada Consolidated Co. curtailed its output about 30%. The Mason Valley plant produced about 1,300,000 lb. per month in 1918, and only 1,000,000 lb. per month in January and February 1919. The output of copper of the Nevada Consolidated was reduced from 6,000,000 lb. per month in 1918 to less than 4,000,000 lb. per month in 1919. The shipments from the Yerington and Santa Fe districts were also greatly reduced.

LEAD AND ZINC. The output of lead in Nevada decreased from 27,677,928 lb. in 1917 to about 21,000,000 lb. in 1918. As the price of lead is reduced and the shipments from the Yellowpine district are smaller there will probably be a decrease in the total for 1919. Heavy shipments continue from the Prince Consolidated mine, at Pioche, in Lincoln county, and the Virginia Louise has become a considerable producer. The output of zinc decreased from 23,307,868 lb. in 1917 to about 15,000,000 lb. in 1918. Most of the ore containing zinc comes from the Yellowpine district, where shipments of both lead ore and zinc ore are only about half those of 1918. Zinc concentrates were stored at the Yellowpine property and new machinery was being placed in the mill building. The Potosi mine, near Arden, produced several thousand tons of zinc ore in 1918, but reduced its shipments about 60% during the first six months of 1919. In 1917 the district produced, aside from other metals, 9,298,706 lb. of lead and 20,535,768 lb. of zinc. In 1918 these totals were reduced to about 5,751,000 lb. of lead and 15,351,000 lb. of zinc.

In the early part of 1919 dividends from Nevada mines were declared by the Nevada Consolidated, Tonopah Belmont, Tonopah Extension, and West End companies.—V. C. Heikes, U. S. Geological Survey.

PLATINUM in Rhodesia occurs in the Somabula diamond-bearing gravels. These are found almost on the main watershed of Southern Rhodesia, about 12 miles south-west of Gwelo. The pebbles also contain chromite.

CALIFORNIA

CARSON HILL GOLD MINES.—MINE WORKERS PROTECTIVE LEAGUE.—GENERAL NEWS OF NEVADA COUNTY.

CALAVERAS COUNTY.—Interesting results are being obtained by the Carson Hill Gold Mines, Incorporated, properties, in operations started under war conditions and still operating under the adverse conditions resulting from the War. The ore is mined at the Morgan mine at Carson Hill and transported about three miles over the railroad of the Sierra Railway Company of California to the mill of the Carson Hill company at Melones. This mill consists of twenty 1250-lb. stamps followed by two 8-ft. Hardinge pebble mills, Deister concentrating tables, and a cyanide plant for the treatment of sand, slime, and concentrate. The tonnage treated from January 1 to July 31 is as follows:

| | |
|----------------|------|
| | Tons |
| January | 1964 |
| February | 3424 |
| March | 5332 |
| April | 6144 |
| May | 6509 |
| June | 6843 |
| July | 6930 |

The cost per ton for the above, divided into two periods, is as follows:

| | June | Average 6 months | July | Average 7 months |
|---------------------------------|-------|------------------|-------|------------------|
| Ore extraction, per ton..... | 1.702 | 1.819 | 1.635 | 1.785 |
| Milling, per ton..... | 1.142 | 1.324 | 1.128 | 1.287 |
| Marketing, per ton..... | 1.126 | 1.188 | 1.110 | 1.174 |
| General expense, per ton..... | 0.638 | 0.805 | 0.752 | 0.795 |
| Total operating | 4.608 | 5.136 | 4.625 | 5.041 |
| Development, per ton..... | 0.784 | 0.648 | 0.414 | 0.604 |
| Total operating and development | 5.392 | 5.784 | 5.039 | 5.645 |

GRASS VALLEY.—At a special meeting of the Mine Workers' Protective League on September 4, a motion was carried to enforce the League rules throughout the district, but to use conciliatory methods as far as possible. The mine-owners take no interest in the new order of things—at least outwardly. New workers are to be allowed one pay-day before affiliation and 15 days' grace should 'persuasion' be found necessary. At the end of that time the committee "would take such action as the circumstances demand." Occasionally a new man is found who does not take kindly to voluntary membership. What course will be pursued with unruly members has not yet been made public. The paid membership is now between 900 and 1000. The primary cause of the strike in June last was given as the high cost of supplies in Grass Valley. These are now about the same to the single man as formerly. High living costs brought about demands for other working conditions, and a compromise agreement was finally adopted, the principal

feature of which was a mine-operated store where goods were to be sold at cost. Since returning to work one hears nothing but 'time' and 'wages'; there has been nothing done toward maintaining a goods-at-cost store. No protest has yet been made by the men or by the League as a body. It is only conjecture whether anything will be done at all; but in solidifying the organization by insisting on every worker becoming a member, almost summary proceedings are taken. It is not unlikely that when the League has its full membership other demands will be made more unreasonable than the last. With a large income from dues the League must soon be in a position financially to enforce its demands or close down the mines entirely. The majority of the family men were against the June strike but were easily outvoted and what course they would pursue in the event of another strike can only be guessed. With a full treasury and changing conditions they would undoubtedly follow their officials. The League is accountable to no other organizations and so has a free hand.

The Golden Center Mining Co., operating in the heart of Grass Valley, which has been brought into prominence of late through its application for a mineral patent within the town-site, closed down September 5. The action was not unexpected in the light of recent statements made by the officials of the company. Some 25 men are thus thrown out of employment. The mine will remain closed as long as the present high costs continue. The ore on the 500-ft. level is stated to mill about \$18 per ton, and the recent discovery on the 1100-ft. level has proved a body of \$40 ore to extend from the 800-ft. line to the 1100-ft. There was a heavy flow of water at the lowest level, practically forcing an abandonment of that portion of the mine. The Golden Center has had somewhat of a spectacular career. At the beginning of operations several dividends were declared from high-grade ore and a great deal of specimen ore was produced; but no surplus fund was created, and when threatened with a continuation of high costs and labor troubles, coupled with a light pumping plant, closing down was all that could be done. The mine has paid about \$500,000 in dividends and at the late meeting the stockholders authorized the sale of 187,000 shares of treasury stock at \$1 per share to create a fund for the purchase of new machinery when operations are resumed.

William F. Bawden has bonded the 30-acre ranch of Thomas Geach. The bond runs for two years. Bawden did considerable work on a former bond and will recommence active prospecting immediately. There are

two tunnels, one 200 and the other 330 ft. long, with a winze 70 ft. deep. There are some well-defined veins running through the property, which is close to producing mines. The work of unwatering the Idaho-Maryland shaft will commence within two weeks, the delay having been caused by the failure of necessary machinery to arrive. E. M. Taylor, manager of the Signal mine, is doing extensive prospecting on the 200-ft. level with encouraging results. The first water was raised at the new Alcalde, formerly the Kenosha, on August 31, and the work of draining the mine is expected to proceed rapidly. George F. Taylor of Downieville has charge of a gang of 40 men who are rushing foundation work on the new concrete dam at Bullard's Bar, with the object of completing that portion of the work before the winter rains set in.

NEVADA COUNTY.—The Gaston mine near Washington has shut-down until spring, or until such time as labor

preparation for encountering the cemented gravel known to exist in the company's holdings and a portion of Harmony Ridge, famous as a gold producer many years ago. The channel has been worked on each side of this company's land and a tunnel now over 800 ft. long has been run toward the gravel at a heavy expense.

SIERRA COUNTY.—A. Siebert of San Francisco is looking over the Primrose quartz claim in Hog canyon, where he is having development work done. The long tunnel being driven to tap the gravel in the Gibraltar mine at Poker Flat will not be complete until next spring.

NEVADA

GOLDFIELD.—MINERAL COUNTY.—GEOLOGY OF TULE CANYON AND PRESENT OPERATIONS.

GOLDFIELD.—The winze from the 320-ft. level of the Cracker Jack is 100 ft. deep and a station is being cut

TULE CANYON, NEVADA: THE FLOW INTO THE SLUICES

may be depended upon. The company has been under a heavy expense for a number of months in repairing the surface plant and placing the mine in a condition to produce. From 30 to 40 men have been employed. The company lost one mill and other surface improvements by a fire a few months ago. The old Delhi mine, Columbia Hill, and some dozen adjoining claims under bond to A. A. Codd of Reno, Nevada, is being advertised by the sheriff to satisfy a judgment obtained by the heirs of Louis Nonnenmann of San Francisco to recover approximately \$40,000. The corporation under the Codd bond has been known as the Consolidated St. Gothard Gold Mining Co., and, aside from the claims, included water rights and easements. A. W. Hoge, superintendent of the California Mining Co., is building a 15-stamp mill at Willow Valley, three miles from Nevada City, in

preliminary to cross-cutting to the vein, which is estimated to be 50 ft. distant. The vein, when cut from the 60-ft. point in the winze, was found to be 28 ft. wide, with 8 ft. of ore averaging \$25 per ton. This work is the most interesting in the Goldfield district at the present time, as it is being done far north of what has been generally recognized as the limit of the orebodies. Sinking the winze 40 ft. will give an additional depth of 100 ft. on the dip of the vein. An ore-shoot from three inches to two feet wide has been drifted on for 30 ft. from the east cross-cut on the 910-ft. level of the Spearhead. The grade of ore is described by the management as "fairly good". From 18 in. to 2 ft. of ore assaying 127 oz. in silver has been opened by the West Divide Mining Co. in a 15-ft. drift from the bottom of a 60-ft. shaft. Driving was started in a three-inch seam, which

has widened to 18 in. at the top of the drift and to 2 ft. at the bottom. This is the only work being done in the West Divide district, 10 miles from the main Divide.

MINERAL COUNTY.—The east drift on the 280-ft. level of the Jumbo Copper Mountain company, north-east of Luning in Mineral county, has attained a length of 630 ft. At 365 ft. this drift entered the downward extension of the Fox lease orebody and continued in ore of mill grade for 150 ft., according to J. K. Turner, consulting engineer for the company. It is now entering the downward extension of the No. 1, or Lapatt lease orebody, which produced \$60,000 from above the 80-ft. level. The west drift is 150 ft. long and is being continued to open orebodies developed nearer the surface by lessees. The Jumbo Copper Mountain company, which is controlled by the stockholders of the Jumbo Extension of Goldfield, has been developed continuously

other Wingfield companies and now general manager for the Goldfield Development company, the Tule Canyon Placer Association has sunk a 35-ft. shaft to bedrock and has started cross-cutting to the west side of the canyon. This work is being done under an option on claims near the northern end of the canyon. South of the claims being developed by the Tule Canyon Placer Association the Goldfield-Tule Canyon Placer Mining Co. has sunk a 42-ft. shaft five feet into bedrock, has cross-cut the canyon to provide a sump for the heavy flow of water on bedrock, and has started prospecting for pockets of rich gravel.

Tule canyon has for many years been a problem for placer experts. It is 12 miles long, extending south toward Death valley from Mount Magruder, a heavily eroded mass of limestone and shale known to the placer miners as the 'water mountain' because the water in

PLACER MINING IN TULE CANYON, NEVADA

since it was taken over by the Goldfield company 26 months ago. The production, including ore shipped previous to July, 1917, has been over \$100,000 and over 6000 ft. of development work has been done through four shafts, the deepest 305 ft. Both east and west of the shaft the present work is being done on a contact of granite and monzonite, or granite porphyry. It is the intention of the company to continue driving on the 280-ft. level and to grant leases wherever they will not conflict with the work being done on this level. Ore that will pay at the present price for copper will be shipped when found. Laboratory tests to determine a treatment method for a mill which it is planned to erect have been completed satisfactorily and additional tests are now being made on half-ton and ton lots.

TULE CANYON.—Under direction of A. I. D'Arcy, former consulting engineer for the Tonopah Divide and

Tule is believed to originate in and near it. The walls, the bedrock, and the gravel are granite, with seams of slate. The gravel is from 10 to 20 ft. deep for five miles from the upper, or northern, end, and is over 100 ft. deep near the lower end. The gold, showing little wear and worth \$16 per ounce at the mint, was deposited from the upper end. Commonly it is found in flakes, practically all of which settle within 20 ft. of the head of the sluices, but in the upper reaches nuggets of fair size have been found. As the lower end is approached the gold gradually becomes smaller and is more difficult to recover. The deposits are supposed to have had their origin in the erosion of a large area extending north from the canyon. From bedrock to the surface for five miles from the head of the canyon the gravel is filled with boulders, some of which weigh hundreds of tons. The surface of the bedrock is fairly smooth, with ridges

crossing under the gravel at frequent intervals. Indications are that 12 of these ridges will be found within one and one-half miles on the claims of the Goldfield-Tule Canyon, and one is the present objective of a drift being driven north in the centre of the wash by this company. The ridges form natural riffles and there are some well authenticated instances of early day miners finding from \$10,000 to \$40,000 worth of gold banked against them above water level, as in no instance is bed-rock known to have been reached by them. In winter the water rises 17 ft. above bedrock in the shaft of the Goldfield-Tule Canyon company, and this summer, one of the driest ever known in the canyon, the average depth was eight feet.

There is only one instance known of comprehensive sampling being done in the canyon and in that work, reported to have been paid for by the Guggenheims, 75 drill holes to water level gave an average return of 10c. per yard. These holes are said to have sampled 160 acres. In recent years a number of companies and individuals have investigated the possibilities of Tule, all with exception of the two organizations now working having in view larger operations than are involved in drift mining. This led to the canyon being turned down by the investigators, either because they considered that the deposits could not be worked economically or because they considered the initial expense to be too great. Five years ago a placer expert, following an examination of the lower half of the canyon, gave it as his opinion that the deposits could be mined successfully with an initial expense of from \$500,000 to \$1,000,000 for dredging equipment. This part has been variously estimated to contain from 25,000,000 to 50,000,000 cu. yd. of gravel and sand. There is little on which to base such estimates.

The Goldfield-Tule Canyon company is equipped with a 12-hp. hoist and a 500-gal. sand pump placed 22 ft. from the bottom of the shaft. The equipment of the Tule Canyon Association is similar. The work of both is still in the experimental stage. Both are washing gravel averaging over \$1 per yard. The Goldfield-Tule Canyon company has found gravel worth as high as \$12 per yard and the Association has exposed material assaying as high as \$7 in small quantity. Officials of the former estimate they can clear expenses with \$1 gravel.

WISCONSIN

REVIEW OF THE ZINC, LEAD, AND PYRITE INDUSTRIES FOR AUGUST.

August has been a bad month for zinc mine operators, the uncertainty of the metal and ore markets complicating a situation already rendered sufficiently difficult by industrial troubles. Threatened railway strikes the first half of the month imposed embargoes on shipments of all kinds, and mining concerns were left without transportation facilities for an entire week and with irregular schedules over the greater part of the month, even after a desultory attempt had been made to re-establish stated schedules. The threatened strike in the steel industry

toward the close of the month was an added factor making for caution, and a scarcity of cars developed when demands came for increased shipping facilities to move live-stock and grain to market centres. Large buying interests, which have been out of the field for two months on account of strikes at smelters, were obliged to leave competitors with a free field, and consequently offerings were lower than standard and published quotations. Grasselli Chemical Co. of Cleveland resumed buying high-grade blende the last week of the month, but purchasing was light. Eagle-Picher Co. resumed buying in the Wisconsin field after having purchased the Lanyon Zinc Co.'s smelter, at Hillsboro, Illinois, but here too no very considerable tonnage was obtained. The United Zinc & Smelting Co. established a buying agent in the field and fair offerings gave hope to producers that when market improvements develop this added buying power will again introduce a measure of competitive bidding, to the advantage of zinc mining. Prominent operators interviewed during the month state the belief that no radical changes for the better may be anticipated in the zinc mining industry until industrial and transportation disturbances have been completely restored to a somewhat normal basis. In this belief operations are being conducted most conservatively, the output for the month of August, on zinc ores, being about 50% of actual maximum capacity.

Prices for zinc ore showed declining tendencies all through the month, opening the first week at \$50 per ton, base, for premium grade blende, with fancy lots selling at a point about \$3 higher. Second grade ore was in fair demand at \$47.50 per ton. A sudden drop brought the base on high-grade down to \$45. Second grades ruled at the same figure, but instructions to buyers carried the admonishment that prices were quotable to buyers only and where agreements were in effect sellers held an advantage. A gain was made the third week of the month, high grade going to \$48 per ton base; seconds, \$45 to \$47. The premium grades advanced \$1 per ton with second grades holding level. The last week of the month saw both high-grade ore and seconds on a par, namely, \$46. It was found, on comparisons, that offerings at several points in the field differed, some buyers offering as high as \$46 at the same time that others, on an equal zinc assay basis, were offering as low as \$42. This added to the confusion in the field, and many sellers admitted they could not gauge the situation. Low-grade producers, that is, producers of ore assaying under 40% zinc, found a poor demand for their product all month. The leading refining plants offered about all the market there was to be found, and they took only enough to offset the reduced output of the larger operating groups. The reserve of zinc ore of all grades showed 6000 tons of unrefined zinc concentrate and about 2000 tons of high-grade separator product.

Lead ore was also given a decisive set-back during the month. Offerings were held at \$67.50 at the beginning of the month. The first set-back carried to \$65 and the second to \$62.50. Then came a reaction, pig-lead hold-

ing firm in the Eastern and local markets, and bids went as high as \$65 per ton, assay basis 80% metal. The offerings holding at the close of the month were on a basis of \$64 but high-grade material brought the top price at a figure above \$65. Sellers were cautious and averse to considering the lead ore market at all. When the embargoes were in effect not a pound was offered for shipment and the total clearance for the month was very light.

There was little carbonate zinc ore shipped out of the Wisconsin field during the month. Shippers of pyrite showed some anxiety to dispose of reserve stocks as soon as prices for commercial sulphuric acid showed an improvement, but freight-rates and a scarcity of cars restricted the amount of this class of ore marketed.

Deliveries of ores were as follows for August:

| District | Zinc, lb. | Lead, lb. | Pyrite, lb. |
|-------------------|------------|-----------|-------------|
| Benton | 14,820,000 | 858,000 | 1,614,000 |
| Galena | 6,146,000 | 80,000 | |
| Livingston | 3,602,000 | 160,000 | |
| Shullsburg | 2,706,000 | 168,000 | |
| Hazel Green | 1,948,000 | | |
| Cuba City | 972,000 | 296,000 | 1,426,000 |
| Highland | 900,000 | | |
| Total | 31,094,000 | 1,562,000 | 3,040,000 |

Refining plants were actively engaged all month and made a fair record, all drawbacks considered. Shipments were as follows:

| | Lb. |
|----------------------------------|------------|
| Mineral Point Zinc Co..... | 6,986,000 |
| Wisconsin-Skinner Roasters | 5,116,000 |
| National Separators | 5,014,000 |
| Zinc Concentrating Co..... | 566,000 |
| Total | 17,682,000 |

The gross recovery of crude concentrate, at mills, for the month amounted to 15,692 short tons; total net deliveries to smelters, 9277 short tons. The Mineral Point Zinc Co., Wisconsin Zinc Co., and National Zinc Ore Separating Co., received the bulk of the crude concentrate as it came from mills. Refined ores from Mineral Point went to the company's own smelters at Nassau, Illinois; from the Wisconsin Zinc Co. to the American Zinc Co., Hillsboro, Illinois; from the National Separators, in open market to all representative open market buying agencies, in the field.

Exploration work conducted with drills was given fresh impetus during the month and some exceptionally rich ore was found at several points, especially for the larger operating foreign corporations of this field.

ALBERTA

SMOKY RIVER COALFIELD.

Subsequent to an investigation by a select committee of the Senate, the Hon. Arthur Meighen, Minister of Interior, has cancelled a large block of valuable coal leases in the Smoky River district, some 200 miles north of Edmonton. These leases were granted to Mr. Botts, a German-American, in 1912, and \$100,000 had been

paid on them up to 1917 and a survey had been made for a railway to connect the coalfield with the Grand Trunk Pacific system. In 1918 Mr. Botts failed to make the annual payment on his leases and consequently they have been cancelled. During the investigation, officials of the Geological Survey testified that, so far as is known, this coalfield is the richest in the whole of Canada, and if it is developed and connected with the Grand Trunk Pacific or the Canadian National railway—only about 60 miles of line is required—it would be capable of supplying the needs of the whole of Western Canada. The cancelled leases comprise 18,000 acres, and the area contains seams ranging from 5 to 17 ft. in thickness. It is estimated by the Geological Survey to contain between two and four hundred million tons of coal. The nature of the coal varies from a rich bituminous to a semi-anthracite. The following two typical analyses will give an excellent idea of the quality of the respective varieties:

| | Bituminous | Semi-anthracite |
|-----------------------|------------|-----------------|
| Moisture | 1.1 | 0.9 |
| Volatile matter | 18.4 | 13.4 |
| Fixed carbon | 74.0 | 81.7 |
| Ash | 6.5 | 4.0 |
| B.t.u. | 14,100 | 14,706 |

The area has been withdrawn from location, and it is suggested that the Government should develop it itself either on a national or a royalty basis. It is stated that the connecting link of railway between the coalfield and the Grand Trunk Pacific or the Canadian National railway will be started with the greatest possible speed. The price of coal in Western Canada has risen to such an alarming extent that it is threatening to throttle other industries. Thus, for example, the price of coal in Vancouver and Victoria cities has risen from \$7.50 in 1914 to the present price of \$11.25. If the Government decides to develop the Smoky River coalfield, as is proposed, it will be done with the view to controlling fuel prices within reasonable limits.

BRITISH COLUMBIA

DOLLY VARDEN SHIPPING.—CANADA COPPER CORPORATION.

After a protracted period of idleness, due to litigation, the Dolly Varden mine, recently acquired by the Taylor Mining Co., is once more on the shipping list. The mine is producing about 100 tons of ore per month, and the product is being sent to the Granby company's smelter, at Anyox, for treatment. With regard to the company's railway and the other mines in the district, after a conference between the company's officials, the Alice Arm Commercial Club, and Mr. J. H. King, Minister of Public Work for British Columbia, Mr. Taylor announced that, in regard to shipping custom ore to the water, much would depend on how the railway and equipment behaved during the shipping of the company's own ore, but that if he could possibly see his way clear to face the many complications involved he certainly would help the prospective shippers to the limit of his ability. A five-

ton trial shipment of copper ore from the Regal group, Princeton district, to the Dalziel copper leaching and recovery plant, at Vancouver, yielded 2.4% of copper, of which 93.5% was recovered with a consumption of 1.8 lb. of 66° sulphuric acid per pound of copper recovered. The ore was roasted for eight hours, the product crushed through a 20-mesh screen, and then agitated by compressed air in a solution of 40 lb. acid in 3000 lb. water. A four to eight-foot vein carrying a rich streak of antimonial-lead ore, running 21.6% antimony, 21.5% lead, and 7.4 oz. silver per ton has been struck on the E and M claim, on Cascade creek, Lardeau district. The Nelson School Board proposes to renew its course of lectures and laboratory work for prospectors this winter if a suitable lecturer can be obtained. The course will run from October 1 to March 31. The course was stopped during the War on account of lack of attendance. The Canada Copper Corporation's report shows that the deficit on operations at Greenwood last year amounted to \$19,574. The Greenwood mines and smelter were abandoned and the corporation is now bending all its energies to the development of the big copper deposits at Copper Mountain and in the erection of a concentration plant. The output from the Granby company's mines for July totaled 2,637,184 lb. of copper. New wharfs are being built at the Canadian town of Stewart and the U. S. town of Hyder to accommodate shipping from the Salmon and Bear River districts. The roads to the mines in this district are so impossible that shipping can take place only in the winter over snow. The Premier company intends to experiment with motor-sleds; it has a large tonnage ready for shipping.

ONTARIO

OIL COMPANIES OF UNCERTAIN STANDING.—CONDITIONS AT PORCUPINE.—THE STRIKE SITUATIONS AT COBALT AND KIRKLAND LAKE.

TORONTO.—Stock in several Texas oil companies of uncertain standing has been extensively offered for sale by local brokers, who have failed to comply with the law requiring that before shares are offered to the public a company shall file a prospectus containing full information as to the directors, the amount paid for the property, preliminary and promotion expenses, and other details which will indicate the character of the enterprise. The Provincial government has undertaken to protect investors against fraudulent schemes of the 'get-rich-quick' order, and has started prosecutions against several Toronto brokers, two of whom pleaded guilty to the charges laid against them and were fined \$400 and \$300 and costs respectively.

PORCUPINE.—The continued strikes in the Kirkland Lake and Cobalt camps have improved conditions at Porcupine, where labor is becoming more plentiful. More men are being taken on at the leading producing mines, the staffs of which show a steady improvement in efficiency. The Porcupine Crown has been dewatered and mining operations resumed. Preparations are being

made for re-opening the mill during the present month, plenty of ore to keep it running being available. Development work on the Dome Extension is being actively pushed. Three cross-cuts at the 600-ft. level show good ore and a fourth has been started. Preparations are being made for stoping. L. G. Harris, general manager for the North Davidson, has gone to England with the object of interesting British financiers in the enterprise. The company hopes to raise \$200,000 to enable the program planned to be carried out. The Anzac has changed the name of the company to the Wakenda in deference to the wishes of some of the war veterans who objected to the commercializing of the name Anzac.

KIRKLAND LAKE.—With the exception of a limited amount of work that is in progress on some of the outlying prospects, mining operations in the camp are at a complete standstill. The striking miners have nearly all left the camp except some who have found employment at road construction at much lower wages than they were obtaining in the mines. A number of the leading mines are making arrangements to remain closed down for the winter. This decision was largely influenced by the high rate of overhead expenses prevailing previous to the strike, which they hope will be considerably reduced by spring. The construction of the new road from Swastika to Kirkland Lake is making satisfactory progress. The Granby-Kirkland, a new company, is operating two claims about one mile north-east from the Tough-Oakes. About 400 ft. of surface trenching has exposed three promising veins varying in width from 3 to 5 ft. A shaft is being sunk. The Kirkland Porphyry, which has very few shareholders and no creditors, has gone into voluntary liquidation.

COBALT.—The miners' strike is still unsettled, and operations are generally suspended and many of the mines flooded. A visit to this camp was part of the itinerary of the Prince of Wales, and great preparations had been made to give him a fitting reception, including an inspection underground, but his visit has been cancelled on account of the strike. A committee of business men of Cobalt made an attempt last week to effect a settlement, but it was no more successful than former endeavors to bring the parties together. The mine managers have issued a lengthy statement defining their position, reiterating their determination not to recognize the Western Federation of Miners, and accusing the Minister of Labor of unfairness in refusing to accept evidence offered by them as to the objectionable character of that organization. The mine workers have appointed a committee independent of the union, and latest reports indicate that conferences between this committee and the mine managers may perhaps bring about an agreement. The Mining Corporation of Canada has taken over from Campbell & Fairbairn their lease of the Foster mine, which has four years to run. The Nipissing has declared its usual 5% quarterly dividend. The financial statement as of August 23 showed cash in bank, war bonds, ore on hand and in process, and bullion to the amount of \$3,863,386.

CONVENTION OF AMERICAN MINING CONGRESS

The convention of the American Mining Congress will be held at St. Louis, Missouri, beginning November 17, and will last from ten days to two weeks. In the last two years, on account of the War, there have been only directors meetings, and it is expected that the present convention will be the largest the American Mining Congress has ever held. Twenty-five hundred mining men are expected to attend. Coal, oil, and all metals, including chrome, manganese, and tungsten, will be discussed. The object of the convention is the stimulation of the mining industry, including the markets upon which it depends. The program of the speakers will be announced later. Bulkeley Wells is president and J. F. Callbreath secretary.

ARIZONA

Oatman.—The United Eastern Mining Co. has declared a dividend of 7c. per share, payable on September 28, to stockholders of record at the close of business on September 8.

CALIFORNIA

Eldorado County.—The Day brothers are getting out, for a test run, a carload of copper ore from the Lady Emma copper mine, 12 miles north-west of Placerville. The ore will be shipped to a reduction plant on San Francisco bay to be tested for recovery and best method of treatment. If it proves profitable shipments will continue to be made. The claim is patented and is owned by W. F. Detert, of San Francisco.——**T. A. Murray**, who was in Placerville recently from the East Belt of the Mother Lode, reports that active mining operations will be started soon by Omer and L. P. Denny, of San Francisco, on the Rocky Bar River Gravel gold mine, situated on the north bank of the middle fork of the Cosumnes river 14 miles south-east of Placerville. Special mining machinery will be installed. Last winter the Linscott Drilling Co., of San Francisco, drilled five holes with a Keystone churn-drill to a depth of about 60 ft. The sampling showed that a quantity of the gravel contains an average of \$9 gold per cu. yd. About a year ago, J. A. Prentiss, who was superintendent of the mine, is said to have recovered over \$6000 in gold nuggets from the property within a short time.——**Charles Woodburn** has given a working lease and bond on the Livingston Deep Gravel gold mine, near the Rocky Bar mine. A new drift tunnel will be run by the lessees to tap an unworked part of the buried river-channel. The property, which is a continuation of the rich Slug Gulch channel, was mined in the early days of the district and a considerable quantity of gravel gold was recovered.

Grass Valley.—Dewatering the North Star mine has been almost completed and mine operations resumed for the first time since the miners' strike last spring brought about flooding of the lower levels.——The workings of the Empire have been cleared beyond the 4300-ft. level. Preparations are being made for resumption of production at this point. The management is proceeding with construction of the 20-stamp addition to the 60-stamp mill.——Dewatering the Sultana is making progress and normal mining is to be resumed soon.——The Bullion Exploration Co. is assembling equipment

for dewatering the Bullion group. The shaft is 1500 ft. deep and it is understood three electric pumps will be installed.

——**The Kenosha mine** is being cleared of water at the rate of 15 ft. per day by the Alcalde Gold Mines Co. Lloyd Root, superintendent, is arranging for early mining.——From the 200-ft. level of the Signal Peak a cross-cut is progressing toward an orebody that shows good ore near surface. E. M. Taylor is manager.

Nevada City.—The Illinois placer claim near Logan canyon, Relief Hill district, has been purchased from J. N. Neuman by A. Warrilow of Richmond. Work is to start shortly.——**The California Mining Co.** is erecting a 15-stamp mill at its gravel property in Willow Valley. The face of the tunnel is within 180 ft. of the Blue Lead channel. The gravel is cemented, requiring crushing for release of the gold.

San Francisco.—On September 8 the U. S. Circuit Court of Appeals dismissed an appeal of the Butte & Superior Mining Co. v. Minerals Separation. The appeal was against certain provisions of the decision of Judge George M. Bourquin at Butte in September 1917.

MICHIGAN

Houghton.—The Mayflower shaft is down 1459 ft., and has intersected stringers of ore for the past 60 ft. At the bottom the shaft is in ore that has the characteristics of the Mayflower lode, although the management is not yet prepared to say so officially. At 1403 ft. the shaft went from the trap into the amygdaloid. The dip of the vein is so flat that exploration by continuing the shaft-sinking is uncertain. There is a great deal of interest in the exploration work being conducted at this shaft, partly because of the assays of the drill cores, and partly because the formation upon which the work is being done is out of the known ore horizon. If this Mayflower-Old Colony work should result successfully it offers opportunity for extensive exploration in many other properties in directions hitherto considered unpromising.

NEVADA

Ely.—The strike, which threatened to develop into a long drawn out struggle with no apparent benefit to anyone, was settled on August 29, and the men in the employ of the Nevada Northern railroad and the Nevada Consolidated Mining company, returned to work on August 30. Of the settlement of the controversy, in which he took such an active part, Governor Boyle said: "I believe there will be no more labor troubles in Ely district for some time to come. The agreement and contract which was signed last night by General Manager Lakenan, representing the company, and which the workmen's committee assures me will be ratified by the men, will result in conditions in the district being bettered and in harmony between the company and its employees. The men lost decisively all along the line in their demands for additional wage increases but won on improved working conditions and the guarantee of the company to establish and maintain an elaborate commissary. The men consider this is of more value to them than the wage increase demanded. I have been assured by the committee that all crafts will resume work tomorrow morning. The strike was

unique because of the completeness of the tie-up, its orderliness, and particularly because of the very apparent good feeling existing on both sides as work resumes. There was not one act of violence during the entire month of the strike, and not one of the men was arrested. There were no locks on the gates and men were boarding at the company's boarding-house and co-operating with the company in the protection of its property.

Austin.—Ore returning good assays in gold, silver, lead, and copper has been discovered three miles from the New Pass mine, 25 miles west of Austin. Numerous locations have been filed and work started at several points. The principal group is owned by Frank McLaughlin of Austin and Warren Dunston of New Pass.—A four-foot vein of \$75 silver ore has been uncovered in the old incline of the North Star, at Amador canyon, seven miles north of Austin. Dewatering the incline was completed recently after the property had lain idle 30 years. The main adit is being driven ahead to reach the vein. The North Star is controlled by Charles Kearns and W. B. Cummings of Austin.

Goldfield.—Hoisting ore from the Red Top mine through the Laguna shaft has been started by the Goldfield Development Co. The product is stored in bins of 5000 tons capacity at the Consolidated mill. Repairs to the mill have been practically completed. F. Dean Bradley, mill superintendent, states little change will be made in the flow-sheet until capacity of the 1200-ton plant has been increased to 2000 tons.—Sinking the main winze has been completed at the Crackerjack and a station is being cut. A cross-cut will be driven from this point to reach the Crackerjack vein at a vertical depth of 440 ft. and is calculated to reach the vein in two weeks. On the 340-ft. level the vein is 18 ft. wide with 8 ft. assaying \$25 per ton in gold and silver.

Sunshine.—The J. B. Ratliff lease on the Gem Five mine has exposed an ore-shoot showing native silver, hornsilver, and chlorides. Some gold also occurs. Sinking a 100-ft. shaft is proceeding.

UTAH

Tintic.—Ore shipments from the Tintic district for the month of August show a large increase over shipments for the month of July. In the shipments are included one car of bullion from the Tintic mill valued at \$90,000, while the ore shipped is estimated to be worth in the neighborhood of half a million. The output follows:

| | Cars |
|-----------------------------|------|
| Alaska (lease) | 4 |
| Centennial Eureka | 33 |
| Chief Consolidated | 136 |
| Bullion Beck | 4 |
| Colorado Consolidated | 39 |
| Dragon Consolidated | 94 |
| Iron Blossom | 77 |
| Eureka Mines | 1 |
| Eagle and Blue Bell | 50 |
| Empire Mines | 2 |
| Grand Central | 23 |
| Gemini | 20 |
| Mammoth | 41 |
| Ridge & Valley | 9 |
| Showers | 1 |
| Sunbeam | 2 |
| Swansea | 16 |
| Tesora | 5 |
| Tintic Standard | 79 |
| Victoria | 8 |
| Utah Consolidated | 1 |
| Tintic mill (bullion) | 1 |
| Total | 646 |

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

Harold Rickard is at Toronto.

T. A. Rickard is at Kellogg, Idaho.

Albert Burch has returned from Butte to San Francisco.

F. W. Bradley, who has been in the interior of Alaska, is now at Treadwell.

J. Dawson Hawkins, of Colorado Springs, was in San Francisco last week.

John A. Agnew has been elected president of the Mining and Metallurgical Club, in London.

S. R. Wagel, of New York, and C. A. Heberlein are on their way to Spokane and the Coeur d'Alene.

Arthur L. Pearse has returned to New York from an inspection of the Kirkland Lake district in Northern Ontario.

Arthur J. Hoskin has moved his office to 401 Kittredge Bldg., Denver. He has returned thither from Grand Valley, Colorado.

Thomas T. Read is Engineer in Charge of the Division of Education and Information in the U. S. Bureau of Mines, at Washington.

A. W. Stevens, superintendent and manager for the Idaho Consolidated Mining Co., at Atlanta, Idaho, will re-open the old Boise-King placer mine.

Arthur H. P. Moline has been promoted from superintendent to general manager of the Bendigo Amalgamated group of mines, at Bendigo, Victoria.

Herbert C. Hoover sailed from Liverpool on September 6. On his arrival at New York he will be given a complimentary dinner by the engineering profession.

E. W. Wagy, petroleum engineer of the U. S. Bureau of Mines, has transferred his headquarters from the San Francisco office of the Bureau to the office at Washington.

Shigemitsu Ohta and Ritara Hirota were in San Francisco last week and have gone East to inspect mining machinery with which to combat the increased cost of labor in Japan.

C. E. Carstens, Lieutenant in the Chemical Warfare Service, has received his discharge and resumed his position in the Research Department of the Anaconda Copper Mining Co., at Anaconda, Montana.

O. J. Eggleston, chief engineer for the United States Smelting, Refining & Mining Co. in its Western field, is to succeed George W. Metcalfe as general manager for the Mammoth Copper Co. at Kennett, California.

George W. Metcalfe, general manager of the mines and smelter of the Mammoth Copper Co., is to leave Kennett to take up other work for the parent corporation, the United States Smelting, Refining & Mining Company.

Forrest B. Smith, who is traveling in the interests of the American Mining Congress, is in San Francisco for ten days or two weeks. He may be addressed in care of the California Metal Producers Association, Merchants Trust building.

Gilbert Rigg, assistant to the managing director of the Broken Hill Associated Smelters, and consulting engineer to the Electrolytic Zinc Company of Australasia, passed through San Francisco on August 29 on his way to New York and London.

Van H. Manning, Director of the U. S. Bureau of Mines, accompanied by Mr. Bailey, assistant director, Dr. E. W. Dean, in charge of the petroleum work at the Pittsburgh station, and Dr. Kendle, of the Mine Rescue Division, spent several days during the month of August visiting the San Francisco and Berkeley stations of the Bureau of Mines.

THE METAL MARKET

METAL PRICES

San Francisco, September 10

| | |
|--|-------------|
| Aluminum-dust, cents per pound..... | 50-60 |
| Antimony, cents per pound..... | 10.00 |
| Copper, electrolytic, cents per pound..... | 23.50-24.00 |
| Lead, pig, cents per pound..... | 0.25-7.25 |
| Platinum, pure, per ounce..... | \$105 |
| Platinum, 10% iridium, per ounce..... | \$121 |
| Quicksilver, per flask of 75 lb..... | \$103 |
| Spelter, cents per pound..... | 9.50 |
| Zinc-dust, cents per pound..... | 11.00-13.50 |

EASTERN METAL MARKET

(By wire from New York)

Sept. 9—Copper is quiet and steady. Lead is inactive but easy. Zinc is dull and lower.

SILVER

Below are given official or ticker quotations, in cents per ounce of silver 999 fine. From April 23, 1918, the United States government paid \$1 per ounce for all silver purchased by it, fixing a maximum of \$1.01½ on August 15, 1918, and will continue to pay \$1 until the quantity specified under the Act is purchased, probably extending over several years. On May 5, 1919, all restrictions on the metal were removed, resulting in fluctuations. During the restricted period, the British government fixed the maximum price five times, the last being on March 25, 1919, on account of the low rate of sterling exchange, but removed all restrictions on May 10. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the normal rate of exchange.

FOREIGN EXCHANGE

Foreign exchange declined again during the week. This decline was started the preceding week by the action of the Bank of England in reducing the rate of interest on foreign balances from 4½% to 3%. It is possible the joint-stock banks now may follow suit. Apparently the new departure is in keeping with the indifference displayed by the British authorities as to what becomes of sterling in New York and other foreign centers. The theory is advanced that the action of the Bank of England is prompted with a view to driving foreign money, now in London, into British investments. With a loss facing them of perhaps more than 10% on sterling if their balances are transferred back to this side, American bankers and others may elect, when they observe this reduction in interest rates, to invest in British war bonds or other English securities selling at attractive yields. Sterling around \$4 is regarded as the ultimate salvation of British security values. Therefore, England is not worrying over the raising of credits here now. It means more to her if things are allowed to mend naturally. The Bank of England has been paying interest on foreign balances only through joint-stock banks. It carries no such balances directly, but it has allowed joint-stock banks 4½% on this class of deposits carried with them, on which they have in turn allowed their foreign correspondent ¼% less.

In drawing on her financial resources during the War England left the great mass of her home securities impaired in quoted values. The British people, rich as they were collectively, could not carry a \$40,000,000,000 war burden without sacrifices in other directions. British investors were denied benefit of a war boom, such as American investors experienced, while financing, on their part, a \$30,000,000,000 war. To crown all a short-sighted if not embarrassed government failed to make proper provision for protecting the finances of British railroads when taken over. As a consequence, practically the whole list of gilt-edged British securities have never recovered from the first crash that followed outbreak of the War. They are lower now than they were then. The British investment market is so thoroughly saturated with government war issues that it seemed well nigh hopeless to look for any restoration of former security values for a long time. Private investors, trustees, and fiduciary institutions have viewed the situation with dismay.

Meanwhile the provision of foreign credits on a broad scale seems no nearer so far as tangible developments are concerned. Such small credits as are advanced to particular countries for specific purposes are in fact regarded as tending only to defer such a general settlement. Not many weeks ago the problem of foreign trade, the establishment of credits, and the promotion of reconstruction work in Europe were the chief topics of concern and discussion in financial circles. But domestic problems, chiefly concerning relations between capital and labor, and bordering on a crisis, forced all other considerations into the background. A practical truce has, however, been declared for a time by the labor forces pending efforts to bring down the cost of living, and with domestic affairs on the way to some solution it may be expected that the problems relating to foreign exchange and the financing of foreign countries may be worked out in the next two or three months. The possibility of restoring foreign exchanges and working out a method of extending billions of credit to Europe contains the greatest possibilities for American business.

Quotations on September 10 are as follows:

| | |
|-----------------------|-------|
| Sterling: Cable | 4.16¼ |
| Demand | 4.15¼ |
| Francs: Cable | 8.35 |
| Demand | 8.37 |
| Lire: Demand | 9.65 |
| Marks | 4.25 |

Eastern Metal Market

New York, September 3.

Because of the holiday on Monday, and practically one on Saturday, all the markets were quiet the past week, and so far this week they have not recovered much momentum.

Copper demand has been light and the market controlled largely by second hands and dealers.

The tin market has been quiet and very little business has been done.

Demand for lead has not been heavy, but prices continue steady.

The zinc market has eased off slightly and demand is very light and quotations nominal.

Antimony shows little change.

IRON AND STEEL

Pig-iron production on September 1, according to the blast-furnace reports of 'The Iron Age', was 93,360 tons per day, or at a yearly rate of about 34,500,000 tons. The daily rate a month ago was 85,635 tons. The August output was 2,743,388 gross tons as compared with 2,428,541 tons in July. The blowing in of furnaces continued in August, 266 being in blast on September 1 as against 239 on August 1, a net gain of 27. The tendency toward higher pig-iron prices is pronounced, especially in the Cleveland and eastern Pennsylvania districts where advances of 50c. to \$1 have been made. With labor difficulties temporarily out of the way the iron and steel trade is beginning to devote itself to the commercial developments that are probable in the near future. Steel output in August will probably equal that of July.

COPPER

The demand that has appeared in the last week has been light and has been almost entirely satisfied by the outside market. Quotations are firm at 22.75c., New York, for electrolytic copper for September delivery from dealers and second hands, but it is believed that the amount obtainable is not large. Producers still continue firm in their quotations of 23.50c., New York, for electrolytic copper for September delivery with October held at 24c. Lake copper is quoted at 23.50c., New York, in the outside market with some producers holding to 24c., New York, both for September delivery. Most large consumers are believed to be well provided for September consumption.

TIN

The market has been extremely quiet the past week and very little business has been done. Spot Straits, New York, after easing off to 55.50c. last Wednesday, is again quoted at 56c., New York. Buyers have been uneasy the last week because of the possibility of strikes. Today, however, the situation is much better and the outlook more encouraging as to strikes, and sentiment on the entire non-ferrous market is stronger. A little business was done the middle of last week at 52.50c. in Straits tin due in September, and at 53.25c. on the same due early in September. Offerings of Straits tin for September shipment from the East have been made at 53c. Tin arrivals continue heavy, having been 5215 tons to August 26 inclusive, of which 2075 tons came in at Pacific ports. There was 3590 tons afloat. An interesting statement is that of George Armsby to the effect that a rebate of 2.98c. per lb. is given to all those who absorbed the allocated tin at 72.50c., thus making their net cost 69.52c. per lb. A statement is made public that all Ordnance surplus tin will not be sold but will be used by the ammunition division for future manufacturing purposes.

LEAD

This market has also been quiet the past week in line with all the rest. Odd lots have been offered at New York as low as 5.85c. and so New York has continued to be the weak point in the market. Some producers have sold lead at Middle Western points at an equivalent of 6.10c., New York. We quote the market in view of these facts at 5.90c., New York, or 5.65c., St. Louis. The American Smelting & Refining Co. continues to maintain a quotation of 6c., New York, or 5.75c., St. Louis, for early delivery. The labor situation has also affected this market.

ZINC

Because of the light demand and the possibility of a steel strike, prices have declined and the market has been quiet and easy. Prime Western for early delivery is obtainable at 7.50c., St. Louis, or 7.85c., New York, which we quote as the nominal market. A disturbing factor in this market has been the fact that German zinc has been selling in foreign markets as low as 5c. per lb., based on comparative grades here. Liberal sales are reported to have been made in Norway, Sweden, France, and perhaps England. The prospect of less strike trouble is today the cause of a firmer tone to the market.

ANTIMONY

Asiatic grades are quoted at 9.25 to 9.50c., New York, duty paid, for wholesale lots for early delivery. The market is strong.

ALUMINUM

Quotations for virgin metal, 98 to 99% pure, are unchanged at 32 to 33c., New York, for early delivery.

ORES

Tungsten: Pending some decision as to a tariff on tungsten ores the market has been very quiet. Buyers and sellers hesitate as to their future course. Quotations on Chinese ore are \$7.50 per unit with Bolivian ore at \$10 per unit, duty if any for buyers' account. Quotations on ferro-tungsten are uncertain, more so than ever. British ferro-tungsten, 75 to 80%, was quoted in August at 3s. per lb. of contained tungsten with the metal powder, 96 to 98%, at 3s.6d. per pound.

Molybdenum: The market is unchanged and still dull with quotations nominal at 75c. per lb. of MoS₂ in regular concentrates.

Manganese-Iron Alloys: British producers are taking business now at \$95, seaboard, but whether this is their established quotation it is difficult to say. Some will not take any more orders at \$95. It is evident that the British manufacturers are making a drive for this market. Already some American producers have taken steps to prevent any more British alloy coming into the country on the basis that it is in violation of the anti-dumping law, as it is asserted that the British producers cannot make the alloy and deliver it at present prices except at a loss. The market is active with inquiries of from 5000 to 7000 tons for delivery in the last quarter and first quarter or the next six months. London sales of British alloy have been made at \$95, seaboard. Spiegeleisen is quiet and nominal at \$35, furnace.

Pig iron production for the first half of 1919 is 16,278,175 tons, against 20,826,914 tons for the last half of 1918, and 18,227,730 tons for the first half of 1918. Of this year's product, 11,779,042 went to consuming interests and 4,499,133 was sold.

INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

NEW DESIGN OF ALLIS-CHALMERS MOTORS AND GENERATORS

A new line of commutating-pole direct-current motors and generators, known as type E, has been introduced by the Allis-Chalmers Manufacturing Co. The machines are rugged and compact, with excellent operating characteristics, and the many details which contribute to accessibility, reliability, and safety have been thoroughly worked out.

These new type E machines incorporate the latest and

ventilation. (8) Conduit terminal boxes on all motors. (9) Improved box type brush holders. (10) Standard enclosing covers. (11) Interchangeable parts. (12) All parts easily accessible.

In developing this line it has been the aim of the Allis-Chalmers company to produce not only a rugged serviceable motor, with the best operating characteristics, but also to incorporate the many details which contribute to reliability and safety. The following standard ratings are included:

1. Continuous rated (50°C. rise) motors, for applications where the power requirements are definitely known.
2. Normal rated (40°C. rise) general purpose motors.
3. Adjustable-speed motors for continuous or intermittent service.
4. Generators and exciters.

For constant-speed motors the ratings and

Group of Type E Motors, 20 hp., 10 hp., and 5 hp., 1150 r.p.m.

Semi-Enclosed Type E Motor

Type E Motor Dismantled, 25 hp., 230 Volt, 1150 r.p.m.

best features of direct current engineering practice in the design, construction, and commercial application of motors and generators for practically every industry. They have been designed for belted as well as direct connected application, and are particularly suited to the exacting requirements of machine tool service. Among their important features are the following: (1) Ratings and speeds corresponding to standard 60 cycle induction motors. (2) A complete line of constant and adjustable speed ratings. (3) Rugged cast steel yokes. (4) Commutating poles, insuring sparkless commutation. (5) Dust-proof bearings. (6) Windings treated to resist oil and moisture. (7) Thorough

speeds are the same as those of 60-cycle induction motors, and they can thus be used interchangeably with induction motors for direct connected applications without changing the method of drive or the ratio of gearing. Adjustable speed motors, intended particularly for machine tool and similar applications, are provided for 2:1, 3:1, or 4:1 speed range. Generator speeds also correspond to those of induction motors, thus permitting the direct coupling of the machines to form motor-generator sets in various combinations. The line of ratings now complete covers motors from $\frac{1}{2}$ to 50 hp. and generators from $\frac{1}{2}$ to 40 kw., and larger sizes are under development. Cast-steel yokes, combining light weight and rigid construction, are used for the larger ratings, whereas the smaller machines, which are of the bi-polar type, have riveted frames.

The accessibility of the commutator is apparent from the illustrations. Protecting grid covers can be provided for the openings in the front bearing bracket; they are readily attached and may be applied even to machines in service, without affecting the rating. Solid covers are used with completely enclosed motors, the rating of these machines being somewhat lower than open or semi-enclosed motors.

All machines have ring oiling dust-proof bearings, and the windings are treated to resist oil and moisture. Conduit terminal boxes, regularly supplied, have removable covers, giving ready access to the terminals. Box-type brush holders are adjustable for tension and suitable for either direction of rotation. Each holder can be removed independently with a screw-driver or wrench. At least two brushes per stud are used.

The field coils are wound on metal spools, which prevent any movement of the coils, and are protected by an outside layer of enameled wire. The armature core has the laminations riveted together, permitting the removal of the shaft without dismantling the core or commutator, and for ratings of 20 hp., 850 r.p.m., and larger, the core and commutator are built on a sleeve, so that the shaft can be pressed out of the finished armature without disturbing the windings.

An important feature is the thorough ventilating system which has been provided. The air is drawn out by a fan mounted on the rear armature head, fresh cool air flowing in through the ventilating ducts and taking the heat from the iron and windings. This heated air is forced out through openings in the periphery of the rear bearing-bracket. With thorough ventilation the internal temperatures are kept low thus greatly prolonging the life of the insulation. The entire line is new throughout, no attempt having been made to re-design old apparatus or to employ parts from any previous machines. Bulletin No. 1106, describing these motors and generators in more detail, has just been issued.

WESTINGHOUSE ELECTRICAL APPARATUS AT GEORGIA SCHOOL OF TECHNOLOGY

By M. Emmilline Pitt

The Georgia School of Technology is having installed a full equipment of Westinghouse electrical apparatus. This is a practically complete electrical equipment for a small power plant, consisting of the following apparatus:

One 187 kva., 3 phase, 60 cycle, 220 volt, A.C. generator driven by a 150-kw. turbine through induction gear. Also a 125 kva. 80% power factor unit of similar characteristics. For condensing the steam from these two turbines there will be supplied one surface condenser. There will also be supplied one 175 kva. coupled type generator suitable for gas or steam engine drive. For excitation of the above A.C. generators there will be provided one 25 kw. D.C. geared turbine exciter unit. For miscellaneous service there will be supplied one motor-generator set consisting of a 3-phase induction motor driving a 50 kw. D.C. generator. Driving power to auxiliaries and experimental work will be furnished by one 15 hp., two 50 hp., and one 100 hp. squirrel cage induction motors; these motors are all complete with reels, pulleys, and suitable auto starters of modern design. Three 50 kva. single phase, 60 cycle distribution type transformers, 220 volts low tension, 2200 volts high tension, and one 2 kva. 50,000 volts self-contained testing outfit are also included, together with a complete switchboard with an automatic voltage regulator and necessary control for all of the above generators and exciters. This equipment is modern and altogether is an excellent exhibit of a modern power plant and distribution system on a small scale.

HOME BUILDING PROGRAM

Due to the difficulty the employees of the Westinghouse Electric & Manufacturing Co. have experienced in getting homes near the East Pittsburgh works, the company has resumed the home building program that was postponed during the War. Forty-eight houses are now under construction. The site for the new dwellings is on a plot of 109 acres owned by the company in Wilkins township along Ardmore boulevard. The new houses will form a part of the

general building plan for developing the entire tract. It is estimated this tract will furnish homes for six hundred families. Side-walks and paving will be laid, and gas, water, and electricity will be installed. The houses, which are modern in construction, will be of brick with hollow tile backing, with concrete cellars and cement porches. They will consist mainly of five, six, and seven rooms designed to meet the needs and the pocketbook of the man in moderate circumstances and will be sold at cost on easy terms to the employees of the company. A number of the dwellings will be for rent.

In building the new homes an effort has been made to do away with features that have outlived their usefulness. The antiquated parlor is missing and the centre hall has been replaced with a modern living room which is more economical of space. Those in charge of the building program have made a careful study of the war-time houses erected by the Housing Commission, especially those built in the Philadelphia district for the use of the employees of the Essington works.

The Westinghouse company is one of the pioneers in building homes for its employees, having constructed 72 homes near the Trafford foundry almost ten years ago, as well as owning 127 apartments and homes in Trafford proper. It is likely the building scheme at present under way will later include apartments and duplex houses. T. P. Gaylord, vice-president of the Westinghouse company, is in charge of the building program. Bernard H. Prack, the architect and builder, expects to have the first of the houses ready for occupancy by October 1.

COMMERCIAL PARAGRAPHS

Allis-Chalmers Manufacturing Co. has just issued Bulletin No. 1812 on crushing rolls. This is an eight-page pamphlet describing rolls for spring pressure up to 2000 lb. per inch of roll face, designed for use in small mills and sampling plants where the conditions are such that a heavy roll is not required.

The Chicago Pneumatic Tool Co. announces the removal of their Cincinnati office from the Mercantile Library Bldg. to the Walsh Bldg., Pearl and Vine St., where a service station with a complete stock of pneumatic tools, electric tools, air compressors, oil engines, rock drills, and repair parts will be maintained.

The Wellman-Seaver-Morgan Co. has issued Bulletin No. 27, describing automatic ore unloaders in use on the Great Lakes. This bulletin, which is an 8½ by 11 in. pamphlet of 12 pages, contains numerous excellent illustrations of ore unloaders in action, accompanied by clear and interesting description of their capacities and operation. It will be sent free on request.

The Engineering & Sales Corp. of Chicago has just opened a branch office in San Francisco in the Rialto Bldg. to cover the Pacific Coast in various lines that it handles. It will also maintain an engineering office for the purpose of handling the design, consultation, supervision, etc., on automobiles, trucks, and tractors. The engineering department is under the supervision of F. H. Meyer. S. C. Kyle is the Pacific Coast manager.

The King Trailer Co. has recently opened its own factory branch in Dallas, Texas. This is at 1818 Main street, in the automobile district, and is in charge of A. G. Williams, South-Western sales manager. This step was taken in order to make quick delivery and give prompt service in the State of Texas, and particularly in the oilfield district, where hundreds of King trailers are already in use. A full stock of trailers and repair parts will be carried at the Dallas branch and every effort will be made to give the best of service.

Claims made for Wilfley Tables substantiated by performance records

Twenty-eight Wilfley Tables have been in use at the Judge Mining & Smelting Company, Park City, Utah, for the past seventeen years.

They separate the 200-mesh, and coarser, slime of a most difficult and complex lead, silver, zinc ore. They do it with complete satisfaction and "with low maintenance costs," as the superintendent writes us.

From time to time during their seventeen year's service, these tables have been brought up to

date with the latest Wilfley refinements such as improved riffling, non-clogging launders, and so on.

This is only one of a thousand similar instances where Wilfley Tables have established records for the highest capacities over long periods of time and at surprisingly low operating costs.

There is a type of Wilfley Table for every metallurgical requirement. It will pay you to consider the Wilfley on your work.

Wilfley engineers will gladly co-operate with you. Write for details.

THE MINE & SMELTER SUPPLY COMPANY
DENVER

SALT LAKE CITY

EL PASO

New York Office: 42 Broadway

Represented by Harron, Rickard & McCone on the Pacific Coast

SOMEBODY recently defined an optimist as a man who still carries a bottle-opener attached to his key-ring.

THE strike of the miners and railway men at Ely, Nevada, which was settled on August 29 so satisfactorily to all concerned, was one of the most remarkable that we remember in the lack of violence and in evident good-feeling on both sides. The men continued to board at the company's boarding-house and co-operated with the company in the protection of its property.

CAPTAIN ANDRE TARDIEU, speaking on September 2 before the Chamber of Deputies in Paris during a debate on the ratification of the German Peace Treaty, said the French War losses were 26% of the men mobilized. Of all men under 31 years old with the colors, 57% were killed. This last figure, particularly, is appalling. We on this side of the Atlantic find such losses difficult to grasp; we are too far away to realize fully the plight of that unhappy country. In the light of such statistics, it is small wonder that France demands assurance against a third invasion by her hereditary foe on the east.

A TELEGRAM from Dawson stated that mining had ceased on Bonanza and Eldorado creeks, the two dredges of the Yukon Gold Company having stopped operations, preparatory to being dismantled and shipped to Seattle. This is not quite correct. These two dredges, the only steel dredges introduced into this district, worked for three or four years and were dismantled in 1917. It is said that they will be sent to Burma or to the Malay States to win tin from the alluvial deposits in those regions. We know that Mr. C. H. Munro and other engineers are in that part of the world seeking suitable opportunities for profitable dredging, so the statement appears reasonable. The Yukon Gold Company is still dredging on Hunker, Gold Run, and Bear creeks, and in the bed of the main stream, the Klondike. The valleys of the Upper Yukon have yielded 200 million dollars worth of gold since 1898.

ANOTHER decision in favor of Minerals Separation, although not on the technology of the flotation process, was recorded on September 8 when the U. S. Circuit Court of Appeals in San Francisco dismissed an appeal of the Butte & Superior Mining Company against Minerals Separation. This appeal covered the payment

of costs assessed against the Butte & Superior company in the mandate of the Supreme Court of the United States, directed to the United States District Court of Montana. Butte & Superior took the position that as suit was begun in 1913, and the disclaimer was not filed in the Patent Office until 1917, it should not be liable for the costs. The decision in San Francisco held that Butte & Superior should look to the Supreme Court of the United States for its remedy, and accordingly dismissed the appeal. A petition has been prepared by Butte & Superior, which will be filed in the Supreme Court, asking the court to recall the mandate and disallow the costs.

THE American Institute of Mining and Metallurgical Engineers will hold its fall meeting in Chicago from September 22 to 26. Convention headquarters, where most of the meetings and technical sessions will be held, is to be at the Congress Hotel. More than 150 technical papers have been prepared, so the meeting should be richly supplied with material for the interchange of experiences in recent technology, and to serve as a basis for profitable discussion. There is, however, another side to a meeting of this kind that is not less important, namely, the sociable mingling of men of sympathetic interests, many of them from mining districts on the outskirts of civilization and correspondingly far from congenial companionship and the stimulation of unfamiliar minds. We are glad to see that this most necessary feature has received the enthusiastic attention of the committee, and has been carefully planned. The wives and daughters of members are cordially invited, and many excursions have been contrived for the entertainment of these ex-officio members of the Institute. It is promised that the smoker will be most unusual. Rumor has it—although we cannot vouch for the truth of this—that at the smoker the more serious purposes of the meeting are to be lightened by the presentation of a comedy by a member with an infectious sense of humor and a happy faculty for expression. The title bears a resemblance to a famous metallurgical process whose patents have added to the income taxes of an army of lawyers for many years; the characters have been taken from life; the names are easily recognizable. The banquet is to be held in the middle of the week, so that members who can come for only part of the meeting will almost certainly be able to be present at the banquet. This seems a wise provision, in accord with a suitable attention to the social side. The speakers will include

Mr. Horace V. Winchell, president of the Institute, General Leonard Wood, and Mr. Charles M. Schwab. Captain Robert W. Hunt will be toastmaster. We wish the meeting every success.

DISCUSSION this week opens with a letter from Mr. Charles A. Porter, who writes entertainingly and informingly on 'The Miner and the Protective Tariff'. Under the present law the miner pays an artificially high price for the tools he uses, whereas the metals that he produces are either on the free list or else protected by a tariff disproportionately low. Mr. Philip Argall sends us an interesting letter in defence of Dr. Keith's attack on the patents of the Crowe process, and in support of his opinion gives a detailed description of an apparatus for de-gassing cyanide solutions that was in use and open to inspection 11 years ago. Mr. J. H. Marion, in reply to Professor Uren's article on 'Conventional Symbols for Mine-Maps', submits an alternative set of symbols that he has used with success. Mr. A. R. Pierce writes on the subject of 'Sampling Large Low-Grade Orebodies', which was discussed freely in our columns a few months ago. It will be observed that Mr. Pierce is in error on one point; he assumes that the method of determining a sampling factor by comparing hand-samples with mill-tests, as advocated by Mr. Weber, was intended to be applied only to deposits for which the sampling-factor would be uniform over large areas, whereas those who have followed this discussion from the beginning will remember that it had its inception in the difficulty of sampling with accuracy deposits whose metal occurrence was essentially erratic. Mr. Pierce believes the 'combination method' would be most valuable for low-grade deposits in which the gold is uniformly distributed, but would like enlightenment on some of the details to be observed in taking the bulk-samples.

MEXICO has again come to the fore with a proposal a little more impudent than any that we recall from that land of impudent proposals and insolent threats, but this time it is from the revolutionists instead of the Carranza government. An appeal has been presented at Washington for formal recognition by the United States of the belligerency of the various anti-Carranza factions, and for financial aid toward the overthrow of Carranza and the assembly of a provisional coalition government. This appeal bears the signatures of Gilarado Magara, commander of the 'reorganizing army'; Guillermo Meixuelro, commander of the 'defensive forces of the free and sovereign State of Oaxaca'; Felipe Angeles and Francisco Villa, commanders of the 'convention forces'; and Manuel Pelaez, commander of the 'Constitution of 1857 revolutionary army'. A conference is proposed with representatives of the United States in order to formulate a program for "reconstruction and restoration" of Mexico. By all means! Having failed in our policy of 'watchful waiting', having seen our recognition of Carranza earn only the contempt and

silly threats of that suave gentleman, let us now ally ourselves with the bandits that raided Columbus, that robbed the seamen from the U. S. S. 'Cheyenne', that recently held two of our uniformed aviators for ransom, and more recently seriously wounded the pilot of an army aeroplane that ventured too near the border, and that have committed outrages without end, growing bolder and more insolent year by year as their contempt for us increased. Truly American forbearance is much misunderstood by our troubled neighbor on the south!

SHALL policemen and firemen organize? Or, at least, shall they enforce by strikes demands made collectively? The recent riots at Boston must have brought this issue home to every thinking American. From the unionization of policemen and firemen is but a step to the unionization of the Army and Navy. Indeed, this contingency is even now being discussed. Collective bargaining, that principle by which men with a common interest band themselves together in order that their spokesmen may present their demands with the full backing of their organization, has undoubtedly come to stay. We do not think that many men would have it otherwise. But collective bargaining of the kind that urges men, sworn to uphold law and order, to leave their posts and abandon the institutions in their care to mob violence, is a different matter. Two thousand years ago the plight of him who would serve two masters was foretold. The rapidity with which the situation at Boston got out of hand, so that Governor Coolidge was forced to take command and telegraph the Federal government to be in readiness to aid him with the army and navy, is a warning of what may be expected to take place in many of our large cities if this vicious tendency is not checked at the start. A simultaneous strike of policemen and firemen, combined with the activities of a few incendiaries, would produce a result easily and horribly pictured by anyone who remembers the fires of Chicago and San Francisco. This matter hits the very roots of government; the issue is quite different from that in ordinary industrial disputes. The proper method to obtain reform in the administration of the government of a democracy is by the ballot. An attempt by an organized minority that for some reason holds a position of power to bring about by force changes in methods of government, or changes in the administration of affairs under government control, is as intolerable as the domination of an aggressive autocracy such as that the world has fought for five years. Both are directly opposed to that great principle of democracy, government with the consent of the governed; both attempt to substitute the rule of the bullet for that of the ballot. The policeman is in a position of peculiar responsibility. Like the men in the army and navy, he is one of the ties that hold our government together, and that enforce the will of the majority, peacefully determined, upon that small lawless element that lurks in every community. Upon these rests a responsibility that the ordinary industrial worker entirely lacks. The people should consider carefully what

they would have men in these callings do, for at the end of the restless times we are now experiencing only that which has the support of the country as a whole will endure; and the men themselves should take stock of their responsibilities before they abandon the institutions they are sworn to protect, and embark upon a course that, if followed to its logical conclusion, would lay our government by the people, of which we are so proud, at the mercy of any organized minority that could hit us vitally enough to enforce its demands.

Class Journalism — I

The journalism that speaks for the engineering profession has grown with its clientele and with the development, in a world-wide sense, of the industries in which its supporters are engaged. The kind of publication through which it does its work is called sometimes a 'trade' paper, sometimes a 'professional' paper, and it must be confessed that few of the engineering journals merit the loftier and narrower designation; but it is scarcely worth while to discuss the choice of epithets, because another more comprehensive and more accurately descriptive term is available, namely, 'class' journalism. This conveys its basic purpose, which is to interest and to inform, and thereby to please, a particular class in the community, so as to render the journal itself an effective medium of publicity for those who sell the materials needed by that class. An engineering paper, for example, makes its appeal to the engineers that have the selection and the ordering of the machinery and supplies offered for sale by the manufacturers whose advertisements appear in that paper. Most readers of the technical press are aware by this time that their subscriptions do not even pay the mechanical cost of publication—the paper, printing, and postage—and that the publication of their favorite journal would be discontinued tomorrow if it depended solely upon the revenue derived from subscriptions. These represent only a small fraction of the total receipts of a successful publishing business. It is evident therefore that the commercial basis of a class journal is the printing of information that will be read by those whom the advertisers desire to reach, and whom they will reach effectually if the reading matter is such as will cause the subscribers, or others into whose hands the paper falls, to turn over the advertising pages. It is essential that this, the primary purpose of class journalism, should be frankly recognized. Nor does it require the least apology; on the contrary, it serves to establish the independence of the editorial department, in a manner not permitted to papers whose financial support comes directly from their readers. The editor of a class journal has to interest the class to whom he addresses himself: the advertisers, if they are sagacious, as they are, will ask only that he retain the willing attention of those with whom they, as manufacturers, desire to do business. Thus those who furnish the principal financial support

of the paper have nothing to say about its opinions, and the subscription price paid by those who care most about its opinions is not essential to its support, provided the paper is read by them. The engineer that reads his class journal without subscribing—as in a library or by sharing another's copy—is a more useful client to the publisher than the engineer that subscribes and does not read the publication. This is a cynical fact insufficiently appreciated by most advertisers. They expect the publisher whom they pay for publicity to put the paper into the hands of possible customers and it should not matter to them whether such customers are subscribers or not; but it should matter to them whether the subscribers are in arrears, because the subscriber that cannot or will not pay the small subscription is unlikely to be able to purchase their products, and if he has the money and fails to pay his subscription he may prove a bad risk in larger transactions. Returning to the relation of the editor and the advertiser, their efforts converge in a desire to interest the same class, but the advertiser can have nothing to say about the reading matter provided it succeeds in arousing that interest, and of this the editor should be the best judge; otherwise he will fail in his duty. The modern Greek word for 'editor' is *suntaktēs*, he that assembles the reading matter. If the advertiser asks the editor to insert some of the advertiser's own writing or a contribution prepared by an agent of his, he is foolish, because the publication of such matter in false guise undermines the confidence of the reader and thereby lessens the effectiveness of the paper as a medium of publicity, because the annoyance or disgust felt at finding a puff or 'write-up' masquerading as a technical or descriptive article will cause the discriminating reader—the very one whom it is the desire of the advertiser to reach—to throw the journal or magazine into the waste-paper basket. Good faith is essential to business; the advertiser and the editor that conspire even tacitly to fool the reader by indirection will forfeit his confidence. In order to hold that confidence thoroughly, not only in preserving a judicious detachment from the advertising, but in showing a thorough knowledge of the ideas and ideals of the class to which the journal makes its appeal, it is desirable that the editor should belong to the class that he addresses. For example, the editors of the two leading mining papers have been recruited, so far, from the mining engineering profession, not from daily or financial journalism. We hope that this tradition will be maintained, because it is in harmony with the basic idea of class journalism, namely, the printing of writings prepared in sympathetic understanding of the point of view and the higher interests of a special class. No journalist, however clever, can hold the attention of the class that is concerned with a given department of professional and industrial activity unless he is in close touch with the technique of the work done by that class and the purpose to which the work of that class is devoted; indeed, such sympathetic understanding between an editor and his readers is essential to the maintenance of a satisfactory and mutually stimulating relationship.

The editor has three distinct functions to perform: he revises the manuscript sent to him for publication, he assembles and arranges the various items required to make a complete issue, and he himself writes the articles of comment and criticism that are called 'editorials' in this country and 'leaders' in England. In performing this last function he plays the part of a self-appointed teacher in so far as he addresses a group of people whom he wishes to inform and to influence, but he is more fortunate than the pedagogue or professor in that he addresses himself to grown men, to his contemporaries, to men of wide experience and mature intelligence, so that he receives from them not only the direct help of articles and correspondence, but the mental stimulus of an appreciative and understanding audience. Upon the establishment of this relationship will depend his success as the conductor of a journalistic enterprise.

The Treaty and the Senate

A treaty is "a formal agreement or compact, as between two nations." An *agreement*—that essential will bear stressing. A treaty is not the will of one nation imposed upon another, except in the case of an opponent so utterly vanquished as to have no alternative but to accept the terms imposed. That was the case with the Central Powers; it was not the case among the Allies. Among themselves, the Allies were on an equal footing, if not in a military way, at least in the desire to be fair to each other and to avoid the seed of future wars. Each had certain requirements necessary to its safety or future development, and many of these requirements were conflicting. Italy wanted Fiume; Jugo-Slavia wanted a port; France wanted protection against the aggression that had twice crippled her; England wanted security for her colonies; Japan wanted a free hand for her development in the East; the United States wanted freedom from unstable conditions that would provoke further wars in which she would be inevitably entangled. To complicate the matter many secret treaties, entered into during the early part of the War, were in existence, treaties that could not be arbitrarily abrogated without a surrender of those principles of the sacredness of a plighted word that was one of the things for which we fought. We could not forget the 'scrap of paper'. The problems and conflicting desires discussed in secret sessions at Versailles must many times have seemed almost insurmountable. And out of this maelstrom of clashing interests, this strange entanglement of nations and even races of opposed ideals, a miracle was wrought: an agreement was reached. That little coterie of men, each the ablest his country could put forth, and on whom the peace and well-being of the world, perhaps for generations, depended, compromised their difficulties, and finally emerged with a document accepted by them all. Each had abandoned certain claims in return for other concessions, until a balance was obtained. The remarkable nature of this feat ought not to be overlooked. But it is being overlooked, if we may believe

that public opinion is accurately represented by press reports and the comments of intelligent citizens. The United States, in the Treaty and the Covenant of the League of Nations as they now stand, has not obtained everything she desired; but neither has any other nation. In the very nature of the problem such an accomplishment was impossible. Nor would it have been desirable. One nation that was sufficiently strong to force through a treaty favorable to itself out of proportion to the others would have been offset by other nations that did not obtain their share of what they fought for, with the result that they would have tried to balance the account at a later date. No; compromise was the very essence of the negotiations at Versailles. Let us remember that. If we believe that during the negotiations at the Peace Conference the men who represented us succeeded in having a treaty drawn that embodied a reasonable share of those ideals for which we fought, that with consideration for the rights of other nations we did not come off badly in the inevitable compromises, then we should think soberly before we unlock again a veritable Pandora's box of opposed ideals and conflicting jealousies, while a disrupted world awaits the opportunity to return to peaceful pursuits, and famine and disease stalk unchecked in Europe. It does not require a keen mind to point out elements in which the Treaty and the Covenant as they stand are not as favorable to the United States as we could have wished, or to formulate amendments that would be more favorable to us; but to make other nations accept such revisions would be a different matter. Our politicians have been more than busy suggesting amendments; formulating new treaties and covenants in the quiet of their studies and pouring them forth, surrounded with much oratorical flub-dub, upon an all but exhausted world; forcing our President to tour the country in defence of a Treaty for which he fought through many months at Versailles. The reason is clear: politics that, except in rare instances, has placed personal spite ahead of a speedy settlement of the turmoil that has racked the world for five desolate years. The split of the vote in the Senate on party lines points to this, as does the statement we so often hear that President Wilson slighted the Senate by not consulting it as the co-ordinate branch of the treaty-making power. If the President were of the type that consults easily with men with whom he is not sympathetic, and if he had taken with him to Versailles four or five influential Senators wisely selected from the party opposed to him, there is more than a suspicion that he could have returned with the same Treaty and Covenant, the Senate would have fallen into line behind its leaders, and ratification for both would have been obtained easily. That is the discouraging part of the whole wretched business: not that the Treaty or the Covenant is a compromise that, drawn up with due regard for the conflicting rights and desires of other nations, does not give us everything we want, but that party politics, jealousies, and spite can smother ratification in a mass of frothy oratory while Europe trembles on the verge of anarchy.

The Miner and the Protective Tariff

The Editor:

Sir—Must I apologize for re-opening the century-old discussion on the tariff? It is my purpose to show that the metal-mining industry, at least that portion that interests the Western miner, has been laboring under an unjust and insidious discrimination during the entire period of its development. That the mines have never been looked upon as "infant industries" and that their products have never been objects of solicitude on the part of the politicians at Washington, need not be told. What follows, it is believed, will make clear that to be ignored under a protectionist policy is to be discriminated against, and if any class of men has been ignored in the tariff juggling of the past, it has surely been the Western miner.

In order to study the effects of a tariff upon an unprotected article, silver will be used as an example, as it has never been favored by a protective tariff. That the silver miner is in full competition with the world it is not difficult to understand, for it is obvious that he must sell his product, whether at home or abroad, at the same prices, and under the same conditions as the foreign producer. When it is realized that, at the same time, he must purchase his supplies behind a tariff wall and must pay the high artificial scale of prices and wages usually prevailing under such conditions, one can appreciate that the policy of protection has been anything but a benefit to the silver miner.

Under the present tariff law, which represents the last revision 'downward' there is a duty on tools of 10%, engines 15%, rails 15%, cyanide 25%, automobiles 45% *ad valorem*. These are all articles used by the miner, and, being behind the tariff wall, they take on the usual artificial scale of prices. When these articles are purchased in free-trade countries, other things being equal, they are materially cheaper. Hence we find that our silver miner, and the miner of any other unprotected mineral, operates under an unjust, although indirect, discrimination.

The gold miner is also affected by the same cause. The fact that his product has a fixed selling-price may lead to the belief that he escapes this influence. If, however, we consider that the Rand miner may purchase in a free-trade market, while we remember that our Mother Lode miner must purchase under tariff restrictions, we cannot fail to see that the South African operator has a distinct advantage, and that if the Californian could

purchase in the open markets of the world, he could easily make larger profits.

The argument that prices are kept down by inside competition in the United States may be advanced, of course; but the disclosures of recent years, especially those of Miss Tarbell, should negative this idea. Indeed, we have but to look in an issue of some months ago of the 'Engineering and Mining Journal' to get a hint as to where the shoe pinches. Here we find a clear illustration of what we have been discussing and which we may term protective 'back-fire'. The tungsten miners foreseeing a big drop in the price of their product, sought Government aid. It was refused by the War Trade Board, the following being given as the reason, according to the 'Journal'. "To grant protection," the Board holds, "to one American industry, and possibly affect adversely other industries is without its province." The tungsten producers want protection in order to hold up the price. The powerful steel interests must pay the increased price, and accordingly increase the cost of production of steel just that much. The disadvantage of purchasing in a restricted market is here keenly felt. The view of the War Board was undoubtedly justified. They had no right to discriminate in favor of any one, but the point is, they clearly see the discrimination, and if it exists in that case, how can it be that the purchase of a multitude of articles in a protected market is not also a discrimination?

The conditions just outlined for gold, silver, and tungsten apply also to copper and the other so-called raw materials of the United States. They are either on the free list, or have the benefit of only a low tariff, and are under the usual necessity of purchasing within a protected market. It should now be obvious that the indiscriminate application of high protective tariffs is not an unmixed advantage. Protection concerns itself with the seller—seldom indeed, does it consider the buyer—although a low price may be as vital to the latter as a high price is to the former. It would indeed be interesting to know how many men have met financial ruin by insidious increases in costs due to the tariff juggling of the past fifty years.

The present tariff protects lead and zinc to a small extent, but not to a point where it may be said that these metals receive the average protection; and here it may be pointed out that any article that does not receive what for convenience may be termed an average degree of protection is laboring under discrimination. The formulation of a just tariff, even under the most favor-

able circumstances, is, in the very nature of the case, an impossible task. However, this wholesale method of discriminating against the producers of the 'raw materials' in general, and the miner in particular, should be called into question.

For years the miner has struggled along under this discrimination. He has been the unconscious 'goat' in wholesale class legislation. He has not been alive to the burdens that have been placed upon him. His position is similar to that of the English manufacturer before the abolition of the Corn Laws a century ago. At that time the English were encouraging agriculture by protective tariffs. They had anticipated our more modern methods of robbing Peter to pay Paul. These manufacturers, finally enlightened by the then recent great progress in the science of political economy, began the battle for relief. They had the further aid of English statesmen who had some attributes besides those of the glad-hand politician.

The Corn Laws were repealed. English manufacturing, which had languished, began to take on new life. The heads of these industries soon learned the importance of being able to reach the farthest and cheapest corners of the earth. Supplies for every class of work, mining included, began to pour into England. Ships laden with the products of North and South America, the Orient, Africa, and continental Europe sailed freely into her harbors; and as freely sailed out, bearing in payment a part of the same raw materials that they had brought in, but now having them fashioned into new forms, prepared and finished for the further use of mankind.

The following quotation is given at length as it is illuminating, and is an epitome of almost the entire question before us. Its author was F. W. Hirst, the editor of the London 'Economist', and he was writing, not to influence Americans, but to guide English investors who might contemplate the purchase of American securities, and which might be affected by the American system of protective tariffs. He said: "Sixty years ago, indeed, Paris was still a formidable rival in finance, and the United States in shipping. But just at this critical moment England adopted the policy of a free market for gold and all commodities. A sound currency and an almost perfect banking system were firmly established at the same time that perfect freedom of importing and exporting was given to the whole nation. In the course of a few years all protective duties, and all duties upon exports such as coal and machinery were entirely removed. Our trade advanced by leaps and bounds. British shipping expanded at such a rate that before the end of the century it actually represented, and still represents (1911) roughly, half the world's mercantile marine. The United States after the Civil War adopted an exactly opposite policy of restriction. Prices were artificially raised. The high tariff wall, which was erected to exclude foreign competition, raised the cost of production. American manufacturers were unable to compete in neutral markets, and the American mercantile marine,

which had threatened to rival and out-distance ours, dwindled into insignificance."

This brief review of British tariff history brings out vividly some of the weaknesses of a protective tariff. As a matter of fact, it is an assault upon the whole system. Our interest here, however, is concerned with the effects of protection upon the miner. Gold and silver seem to be beyond the possibility of aid from tariffs; they must suffer as long as the tariff endures. The position of copper is no better, unless the miner exerts enough power in Congress to obtain protection sufficient to enable him to sell copper at one price at home and at a lower one abroad. This is probably impossible; so copper, like gold and silver, must bear the burdens imposed by the tariff, and without any hope of participating in its benefits. On the whole, the tariff has been and apparently must be inimical to the interests of the miner, and while it appears impossible to suggest any remedy in many cases short of a free-trade policy, still an understanding of the indirect effects of the tariff should arouse the miner's opposition to any future attempts to place the country behind such high protective barriers as have been common in the past.

CHARLES A. PORTER.

Tecoma, Nevada, August 25.

The Crowe Process

The Editor:

Sir—In your editorial comment on Dr. Keith's article, in the issue of August 23, you express the opinion that the general idea of de-aerifying cyanide solutions preparatory to precipitation, recognized vaguely in the literature of the subject, was not enough to support Dr. Keith's contention, "but the application of the idea to milling practice, specifically by removal of the dissolved oxygen by means of a vacuum, is quite another matter." Perhaps it is, hence the object of this note is to show specifically such application extending back over 11 years practice.

I was much impressed by Caldecott's article* showing that highly aerated cyanide solutions dissolve off the filiform zinc from gold already deposited, for the reason that I had a somewhat similar experience in a large mill where for a period of nearly three days the solutions emerged from the zinc-boxes with increased gold content—the gold being dissolved in the precipitators—but its solution was not due to excess air. Nevertheless Caldecott's work was duly noted for future use.

Shortly after the introduction of zinc-dust precipitation by Merrill, I was shown the operation of his process in the Homestake mill. Compressed air was used to agitate the solution and zinc-dust in an open vat, prior to pumping the mixture into the filter-presses. That system of agitation was subsequently abandoned for the very reason pointed out by Caldecott (quoted above), or as Rose neatly puts it, "the air agitation, however,

W. A. Caldecott, Proc. Chem. & Met. Soc. S. A., Vol. 2, page 747, 1899.

tended to defeat its own object, one effect being to re-dissolve the gold.”† Here then we have ample warning against the use of a strongly aerified solution, covering the use of filiform zinc and also zinc-dust in the precipitation of gold from cyanide solution, dating away back to the days of decantation or mechanical agitation of slime, including, of course, the leaching-vats that have always been with us. In my own experience the charges in the leachers proved very good absorbers of oxygen; I cannot recall having any particular trouble or expense in precipitating the percolate therefrom even after sending compressed air under the filters to furnish a fresh supply of oxygen to the depleted cyanide solution. A mill-superintendent, who had some trouble through

In 1907 I designed my first plant for air-agitation of slime followed by vacuum-filters of the leaf type. The plant had a capacity of 5000 tons per month, or about 3000 tons of slime, and on reference to Fig. 1, a print from drawing No. 110, Stratton’s Independence mill, dated January 8, 1908, it will be seen that provision is made for de-gassing the solutions in combination with the operation of the filter. This apparatus was given a trial run in April 1908, and during the following year it was placed in continuous service.

The de-gasser was connected with a 16 by 10-in. dry-vacuum pump through a stand-pipe 21 ft. 6 in. to the return bend leading down to the pump, a height deemed ample at an elevation of 10,000 ft. above sea-level. The evolution of gas, however, proved so vigorous that foam occasionally passed over into the air-pump. So the stand-pipe loop was extended through the roof of the mill and became at once an object of curiosity and comment. The header from the suction-filter was connected direct to the gas-separator and the de-gassed solutions removed therefrom by a two-stage centrifugal pump, set 8 ft. below the solution

FIG. 1. RECEIVER FOR DE-GASSING SOLUTIONS

level of the separator, which delivered the solutions to the clarifiers from which the de-gassed solution was piped to the old reliable zinc-boxes.

drain-pipes choking with sand passing worn filters, increased the drop of the main drain-pipe and put in a small air-lift to boost the solution into the collector at the head of the zinc-boxes, without, I was informed, any noticeable effect in the precipitation. I do not approve the method, merely offer it as evidence that solutions from deep vat-charges will under certain conditions stand a little aerifying without materially affecting precipitation on filiform zinc.

Regarding the results obtained from this apparatus, I quote part of an official report addressed to the directors of Stratton’s Independence, Ltd., under date March 17, 1910:

Itimized milling cost, Stratton’s Independence, Ltd., Victor, Colorado, compiled from milling 29,877 tons, in half-year ended December 31, 1909.

With the introduction of air-agitation, however, came, as one might naturally expect, the loading up of the solutions with gases and shortly afterward came the remedy, to those wise enough to apply it correctly. I refer to the vacuum-filter, in my opinion the greatest mechanical advance in slime treatment in the history of the cyanide process. The cheaper and more easily applied method was the wet vacuum in which a single pump pulled the mingled solutions and gases through the apparatus and discharged them to the precipitators or storage-vats. The dry-vacuum process, however, is far superior, though somewhat more expensive to install; it requires an ample receiver, an air-pump to pull out the gases from the filtrate, and a solution pump or barometric pipe to remove the de-gassed filtrate from the receiver. It follows that those operators who installed receivers or de-gassing-vats, as we might more appropriately call them, of ample proportion to make a practically complete separation of the gases from the liquid, have enjoyed the advantage of what has lately been called vacuum precipitation.

level of the separator, which delivered the solutions to the clarifiers from which the de-gassed solution was piped to the old reliable zinc-boxes.

Regarding the results obtained from this apparatus, I quote part of an official report addressed to the directors of Stratton’s Independence, Ltd., under date March 17, 1910:

Itimized milling cost, Stratton’s Independence, Ltd., Victor, Colorado, compiled from milling 29,877 tons, in half-year ended December 31, 1909.

CYANIDE DEPARTMENT

| | | Per ton milled |
|---------------------------|-------------|----------------|
| Labor | 7532.61 | 0.2521 |
| Supplies, general | 1690.52 | 0.0566 |
| Repairs, labor | 788.85 | 0.0264 |
| Repairs, supplies | 453.07 | 0.0151 |
| Pumps | 135.30 | 0.0045 |
| Power | 1730.00 | 0.0579 |
| Insurance, accident | 93.29 | 0.0031 |
| Insurance, fire | 739.02 | 0.0247 |
| Taxes | 594.73 | 0.0199 |
| Cyanide | 3689.00 | 0.1235 |
| Bromo-cyanogen | 2401.77 | 0.0804 |
| Zinc | 490.00 | 0.0164 |
| Acid | 163.08 | 0.0054 |
| Lime | 530.77 | 0.0178 |
| Coke | 61.65 | 0.0021 |
| Fluxes | 144.69 | 0.0048 |
| Chemical reagents | 104.04 | 0.0034 |
| | \$21,342.19 | \$0.7141 |

The weight of chemicals used is not shown, but can be easily ascertained on reference to current quotations for 1909. Zinc probably cost 9 or 10 cents per pound; if the latter, say, 0.164 lb. zinc per ton of ore milled, so far as I know the best record at this mill.

I shall not at this time refer to later practice except to state that when the mill was enlarged a second filter-

†T. K. Rose, ‘The Metallurgy of Gold’, sixth edition, page 381.

vat was installed and a similar de-gassing vat, but this one was placed vertical, its base 7 ft. above the pump, the header from the filter entering 2 ft. below the top so that the filtrate might spray across the vat and cascade down to the solution level. The two de-gassers were so connected that each filter had its own de-gasser and centrifugal pump, yet both filters could be operated from either de-gasser, while the original air-pump served both filters and de-gassers for the entire period, April 1908 to June 30, 1915, when the Independence mill was sold as a going concern to the Portland Gold Mining Company.

This de-gassing apparatus was not set up in a cellar or behind locked doors, it was out in the open mill in full view of the many visitors, and to my knowledge no interested person was ever denied admittance to the mill or an explanation of our practice. The zinc-boxes passing solutions from the leaching-vats and showing at times some of the white precipitate were in full view, as were also the zinc-boxes passing the de-gassed solutions invariably free of such precipitate.

I have not seen the patent from which three claims were quoted in Dr. Keith's article, which claims in the light of cyanide practice during the last decade look like a ghastly joke; yet I doubt if it matters much, for few laws are retroactive and patent claims can scarcely be so classed; anyhow, the design described herein will accomplish for others the same service as it rendered in the Independence mill; its use is as free as the air that it pulled out of over a million tons of cyanide solution in the said mill, including oxygen and, of course, nitrogen, helium, argon, neon, bromine, carbonic acid, etc., whose influence on precipitation is, so far as I know, yet in the womb of future chemical research.

PHILIP ARGALL.

Denver, August 27.

Conventional Symbols for Mine-Maps

The Editor:

Sir—I have read Professor Uren's article in your issue of August 16 with considerable interest, as I have devoted some time to an effort to develop a practical set of map symbols that will conform to general practice. There are a few criticisms of Professor Uren's conventions that should be considered from the draftsman's viewpoint before any effort is made to secure their general acceptance.

First, it should be borne in mind that a great deal of mine-mapping is done by men who are not skilled draftsmen, and, secondly, it is usually desirable to prepare maps in such a form that tracings can be made for blue or brown printing. Therefore symbols should be forms easily and quickly drawn with as little use of colored lines as possible. Attention to these two points will save a great deal of time in the drafting-room and will make the engineer in the field more inclined to accept suggested standards.

Several of Professor Uren's symbols are unnecessarily

elaborate and could be replaced with much simpler conventions. This applies especially to the geological conventions. On colored maps, while yellow has good printing qualities, its use is undesirable for such important features as contacts, faults, and veins, owing to the fact that yellow-ink lines do not stand out well on a drawing, especially under artificial light. Blue for faults and red for veins are preferable. On large-scale maps, where buildings are to be shown in color, the system of the Sanborn Map Co. should be followed as closely as possible, as it is used for all insurance maps throughout the United States. Their colors are as follows: Wood, yellow; brick, red; stone, blue; iron, gray; adobe, brown; others, green.

Professor Uren omits several important symbols, such as sample-cuts, inaccessible workings, etc.

Unless contour-lines are so crowded as to obscure other information on a map, they should be drawn in black. When they are shown in color on tracings intended for

Fig. No. 1.

Fig. No. 2.

blue-printing, brown ink should be used. If blue or brown line prints are to be made, use orange. Features of minor importance can be in carmine. Yellow, orange, and vermilion print nearly as well as black, whereas blue, green, and violet make very poor prints. Colors are unnecessary on most maps except when geology is to be shown without obscuring other features. When prints are to be colored, all black-ink work on the tracing should be done first, and a negative made, after which the colored lines may be added to the tracing. The colored lines may then be copied on the prints by working over a glass plate. The areas of various rock formations should be filled in with washes of solid color arranged to secure as much contrast as possible. In addition to the colors used, all formations should be identified by abbreviations, such as the U. S. Geological Survey uses on its maps. Faults and fissures can be shown with blue lines. Mineralization can best be shown with irregular lines and dots of carmine for gold and silver, brown for iron or manganese, and green for copper.

GEOLOGY

These are the most easily drawn conventions used by the USGS on maps when colors are not used. They are suitable for any rock formations, the names given here being only intended as suggestions. The only rule to be observed is that the symbols shown for sedimentary formations should not be used for igneous or metamorphic rocks.

Sampling Large Low-Grade Orebodies

The Editor:

Sir—I have been a close student of the discussion on sampling and was much impressed with the combination method evolved by Morton Webber. However, I have felt that some of the engineers who have written articles on Mr. Webber's combination method have erred in criticizing it by attempting to apply it to mines to which, from Mr. Webber's writings on the subject, it is evident he would not attempt to apply it himself. For example, Mr. Sleeman attempts to apply it (and thereby attempts to exhibit its shortcomings) to a mine evidently in the transition stage of secondary enrichment.

The combination method, if I have read the discussion correctly, was evolved by Mr. Webber for the sampling of large low-grade gold deposits, such as the Alaska Gastineau, where great accuracy in sampling was fundamental; where a sampling error of, say, 40c. per ton would mean the difference between profit and loss. Having a fair knowledge of Alaskan conditions, I infer that secondary enrichment would not be important, because secondary enrichment in such deposits is practically absent. There has been leaching of solubles at the top which increased the original gold content, and the gold content decreases with depth as the leaching of solubles became less marked, but I think you will agree that this is not secondary enrichment as described by recognized geologists such as Lindgren or Van Hise. I agree, therefore, with R. Raymond in his contribution on the subject that had this method been employed in such an example the enormous capital loss would have been prevented, or at least a large part of it.

To attempt to criticize Mr. Webber's combination method by assuming its application to mines of a different type is illogical. In the large low-grade gold deposits for which this combination method was intended, the sampling error, in my opinion, will be found to be either generally small or generally great. It will not jump about from place to place, as would be expected in a mine of the bonanza type, which as a rule owes its existence to secondary enrichment. The trouble in the case of the Gastineau, and other similar deposits with which I am familiar, was in the inability to determine whether the sampling error was large or small, would the mill-feed as a whole stand up to sampling or would the deposit as a whole show a sampling error that would wipe out the profit.

It seems to me that this combination method would also apply to a large number of low-grade mines whether of gold or copper; I refer to the deposit, either of gold or copper, of large dimensions that is just on the border of the cost-line, the deposit that requires enormous capital expenditure to put it on the map. Careful hand-sampling may show a profit of, say, 50c. or \$1 per ton provided the mill-feed proves to be the same as indicated by hand-sampling. However, this vital point, if hand-sampling is solely relied upon, cannot be disclosed or determined until the final investment is incurred—as at the Gastineau. Mr. Webber's combination method would

show the sampling error as the mine was being opened up and the people putting up the money would realize at a reasonably early date, taking into consideration the size of venture, whether or not the mill-feed would stand up to expectations, how far it was likely to fall short, and if the shortage would wipe out the expected profit. The combination method therefore would seem to me to be of incalculable value in such a deposit and it seems fatuous to apply such a system to mines for which it probably was not intended.

There remain a few points of importance which have not been sufficiently dealt with either by Mr. Webber or his critics. They are: (1) The method of taking the bulk sample, that is, the weight of ore to be removed for each individual mill-test and the method of hand-sampling it during removal; I mean the sampling of the "successive backs" in order to obtain the sampling error, to correct the hand-sampling for the zone. (2) Discussion on the method of determining the size of a zone to be governed by its mill-test. In your editorial of May 2 you indicate that Mr. Webber would space the mill-tests at equal distances throughout the deposit. I do not gather that Mr. Webber has suggested that the ore for the mill-tests would be taken at regular intervals. He has stated that the distances apart would be determined on the evidence of the individual case. To me, the discussion seems to lack a good deal of information on this important phase; Mr. Raymond wrote constructively on this part of the subject, but on these matters there seems to be a good deal left to be said, and I think it would be extremely valuable if this phase, such a vital step in sampling, could be further enlarged upon by either Mr. Webber or some other engineer.

Butte, August 19.

A. R. PIERCE.

THE NELCHINA-SUSITNA REGION, southern Alaska, which covers the headwaters of the Copper, Matanuska, and Susitna rivers, though more accessible than many parts of Alaska that are much better known, had not been fully covered by Government surveys until a few years ago, when a party from the U. S. Geological Survey examined and mapped the unsurveyed areas in that region. There has been but little productive mining in that region, and its geology does not encourage the hope that much placer gold will be found there, but gold lodes may yet be discovered at some places. The region will be made accessible by the Government railroad to the Matanuska coalfield, and its systematic prospecting for gold placers or lodes may perhaps be warranted. A report on the region, by Theodore Chapin, geologist, has just been published by the U. S. Geological Survey as Bulletin 668, under the title 'The Nelchina-Susitna Region, Alaska'. The report sketches the geography and geology of the region and contains topographic and geologic maps covering about 10,000 square miles as well as half-tone views, and includes brief notes on the work done on placers. The report can be obtained free of charge from the Director of the U. S. Geological Survey at Washington, D. C.

A Metallurgical Journey to Shasta, California—V

Smelter Fume. The Fields and Hall Process. Flotation Concentrate.

By HERBERT LANG

A large volume of smoke is evolved at the Kennett works. Computation will shed light upon its bulk and composition, and inferentially upon the comprehensiveness of the means required for handling it. Certain assumptions may be made for convenient calculations. We may assume a daily duty of 1000 tons only, of which 30%, or 300 tons, consists of iron, wholly in the form of pyrite; 4%, or 40 tons, of zinc, in the form of blende; 30 tons of copper, wholly in the form of chalcopyrite; and that no other mineral constituents than these require to be oxidized. The fuel requirements are 8% of indifferent coke, which hardly contains more than 80% carbon. Disregarding the production of sulphate and the waste of oxygen in the blast-furnace and the converter, and the vast quantity of 'false' air drawn into the converter and furnace-flues and passed into the bag-house system, we have as minimum requirements these amounts of oxygen:

| | |
|---|------|
| | Tons |
| To convert the sulphur into the di-oxide..... | 342 |
| To convert the iron into protoxide..... | 85 |
| To convert the zinc into protoxide..... | 20 |
| To convert the carbon into di-oxide..... | 170 |
| <hr/> | |
| Total oxygen | 617 |

To obtain this amount of oxygen requires the blowing in of 3085 tons of air, or a little over three tons to each ton of charge—a quantity largely in excess of what is deemed the average requirement in the pyritic process, which is 1.75 tons per ton of charge. In this case—largely hypothetical—the oxidation is abnormally extensive, and the heat requirements are much exceeded.

The Mammoth plant, after a long and uninterrupted career of usefulness, closed its doors on the 18th of May of this year, on account of the strikes. For several years it had been running on sufferance. Involved in the fume difficulties that caused the ruin of the neighboring smelters, it had been allowed to run under conditions of compliance with certain restrictions deemed impossible at the other plants. A quasi-legal enactment, borrowed from the Utah courts and enforced in Shasta, provides that the smoke shall be freed from sulphur tri-oxide, and that the proportion of the di-oxide in the effluent gases should not exceed $\frac{3}{4}$ %. The fixation of the former is not difficult, but it is costly in proportion to the amount of tri-oxide present, the lime required for neutralization being in the proportion of 7 parts to 10 parts of tri-oxide. The di-oxide is unaffected by the bag-house treat-

ment, and passes into the atmosphere in much greater proportion than is admissible under the terms of the enactment. Dilution of the fume with air is therefore essential. This is accomplished by means of subsidiary blowers, which add an enormous bulk to the gases before their escape from the smokestacks.

This expedient of diluting the gases is so obvious that it is somewhat remarkable that the neighboring smelters did not avail themselves of it. It does not, however, obviate damage suits, since the court decision permits the prosecution of such suits whenever damage can be proved; for it is considered that even this small proportion of di-oxide (about one part in 133) might prove prejudicial to crops.

Twenty years experience and study of the fume problem have neither brought its solution nor settled men's opinions as to the damage caused. The question in its more important aspects therefore remains as at first. No new remedy of thorough efficacy against the effect of the sulphur gases has been put into use, though many of possible utility have been proposed. As regards the effect of the di-oxide upon vegetation, something has been ascertained by experiment and some qualitative results have been reached. A great deal of money has been expended, in experiment, in litigation, and in the settling of claims, many of which, perhaps the most, have been founded on injustice. As in most such circumstances a popular sentiment inimical to the smelting industry was carefully built up by interested persons, among whom lawyers out of a job took the lead, and conducted an active opposition, which can hardly be characterized for the most part as anything more than a blackmailing campaign, the upshot of which was the closing of all the smelters in Shasta but one. As for the more honorable and intelligent part of the community, they, while recognizing that some damage has always accrued, make light of it, and even see in the effects of the smoke on certain insect pests a positive advantage. Evidence is not lacking to prove that orchards at a moderate distance from the smelters have improved during these years, in consequence of the smoke—an admission which shows commendable candor. On the other hand, the casual visitor, impressed with the desolation existing along the gorge of the Sacramento, is apt to take a too desponding view, and assume more serious and long-continued damage. For it is along the railway track and in the immediate vicinity of the smelt-

ing works that the greatest harm has been done, and it is precisely this area, as adverse fortune will have it, that is most visited by the stranger. In the hilly region, where the destruction of vegetation has been fairly complete, a secondary effect of some importance is noted. Divested of its protective covering of trees, brush, and herbage the blanket of loose soil, unprotected from the storms of winter, has become furrowed by thousands of little watercourses, like wrinkles on the countenance of age. The soil, agriculturally considered, could never be supposed of much value, but it is rather a pity that it should be lost. Nature will doubtless take her own method of repairing these slight ravages, helped perhaps by some well considered scheme of scientific re-forestation.

Since the measurable extinction of smelting in Shasta county has robbed the subject of furnace-smoke of its local importance, it is scarcely worth while to speak in detail of the efforts that were made there to control this troublesome product; but two of these attempts possess even now enough interest to command attention. These are the processes known by the names of the inventors, Fields and Hall. The first aimed to remove the sulphur di-oxide by cooling; the other was designed to prevent the formation of the di-oxide, obtaining instead the elemental sulphur, which, besides being innocuous to organic life, is a saleable product. I shall speak of the Fields process first.

The condensation of sulphur gas by the application of cold and pressure is a practical, or at least possible, means of rendering smelter gases harmless; indeed, it is a method by which, under certain circumstances, the condensed product may become an article of industrial importance. The process consists in subjecting the purified and concentrated gas to a temperature low enough to cause it to assume the liquid form, when it is placed in stout iron vessels, to be sealed up and transported to market. Various uses have been found for it when thus prepared, but they are so circumscribed that only a few hundred tons per annum is sold in the United States, and scarcely more in Europe. The Fields process, which was tried at Redding a few years ago, is founded upon this principle, but the experiments were made with such inadequate apparatus and carried on with so little reflection as to the ultimate outcome that they failed completely, with a loss of some thousands of dollars. The central idea was to pass the fumes of the roasting sulphides through a long horizontal flue, and cool them in bulk, whereby the sulphur di-oxide was to have been condensed to a liquid, to be collected apart from the remaining constituents of the smoke. In thus attempting to cool the whole body of the gases a mistake was made. The procedure should have imitated that of the Somerset company, in New Jersey, whose method, imitated in turn from the Germans, consisted in first collecting the di-oxide in water, by which it is dissolved and separated from the other constituents, and afterward heating the watery solution to expel the di-oxide, which is thus obtained entirely free from the other gases and solids

with which it must have been associated. The procedure is entirely analogous to that by which the liquid carbon di-oxide, so much used in connection with the beer industry, is prepared, and it is not at all difficult. In this instance the paucity of demand is the great difficulty—a difficulty not to be overcome until the commercial requirements shall have greatly increased.

The Hall process was tried in 1914 at the plant (generally known as the Balaklala smelter) of the First National Copper Co. at Coram, under fairly favorable auspices, and with results that, although hardly to be called conclusive, seem to give promise of large usefulness. This process aims to desulphurize ores through the interaction of certain combustible gases, especially those containing hydrogen—either free or combined with carbon—directly on the sulphur, but by secondary reactions releasing the latter, so that the element is evolved alone and can be collected by itself. The chemical reactions are not fully understood, or at least probably have not been fully substantiated, although the effect of steam upon hot sulphides has been much investigated. It would appear from the experience at Coram that gaseous hydrocarbons act more readily upon the ore than does steam, and it would also appear that the familiar reaction between sulphur di-oxide and hydrogen sulphide, by which water and free sulphur are produced, played an important part in the Hall process. According to the statements of H. F. Wierum, the engineer in charge, the process, while receiving considerable modifications at his hands, met its best success when a quantity of crude oil, equal to from 6 to 7% on the weight of ore, was burned with a deficiency of air, thus producing a reducing atmosphere, and that the rate of desulphurization was nearly equal, in like furnaces, to that achieved in ordinary roasting. Even at this rate, we are told, the reduction of ore averaging 40% sulphur, was so nearly complete that only 2 or 3% was left. The exit gas contained but little di-oxide—so little, in fact, that it could hardly be detected by the smell. These results are certainly surprising. The apparatus chosen for the tests consisted of turret roasters of an ordinary kind, 18 ft. in diameter, one fitted up for using artificially prepared hydrocarbon gas coming from a producer, while another was provided with crude-oil burners. The latter arrangement, though not contemplated originally, is declared to have been the more efficient. The principal difficulties, consisting in the imperfection of apparatus, especially of the mechanical washer, which was expected to condense and remove the elemental sulphur from the fume, do not seem to have been of an insuperable character at all; and it is hard to see why the process was abandoned. Among the minor difficulties, Mr. Wierum mentions the formation of "certain undetermined organic sulphides," which interfered with the production of pure sulphur. This might have been expected, and it is not unlikely that the undesired products were those polythionic acids which arise from the reaction of the simple di-oxide on hydrogen sulphide, and which injuriously interfere with the practical success of that reaction.

In carrying out the operation in the turret furnace (a plain McDougall) it was found that the process was naturally divisible into two parts. First on the upper hearths there took place a desulphurization, which appeared to leave the metals in a comparatively unattached form, retaining some little sulphur, if we may infer so much from Mr. Wierum's account. This material, having become considerably heated, sinking to the lower hearths, was met by a rising current of air, by which it was oxidized thoroughly, as would happen in ordinary roasting. The hydrocarbon gases, being introduced at a higher level, exercised their effect upon what we may call the rawer portions of the charge, and meeting the rising gases from the lower part, which necessarily contain the sulphur in the di-oxide form, the before-mentioned reaction occurs, among others. This result was evidently not foreseen by the inventor, though it by no means detracts from the value of the method.

In comparing the Hall process with that of Cottrell, which was tried and abandoned at Coram prior to the time of which we are speaking, it would seem that they are in a measure the complement of each other. The Cottrell process removes from the fume the solid and condensable matters, but has no effect upon either the production or the arrestation of sulphur di-oxide. The Hall process prevents the production of the di-oxide, as well as of the condensible tri-oxide. It would seem, then, that the application of both at once should produce an effluent totally free from objectionable matter.

The idea of utilizing the reaction between hydrocarbons and sulphur is not especially new; since Schnabel relates in 'Metallurgy', Vol. I, page 209, that "Sinding generates producer gas with raw fuel and leads it over red-hot pyrite; by the consequent reaction hydrogen sulphide is formed," etc., etc. Reference to this reaction may be traced in other comparatively old publications.

The fume question, which was the cause of so much persecution and so much annoyance and loss, reached an indirect solution when the Mountain Copper Co., ever foremost in vital improvement, removed its activities to the neighborhood of Martinez and set about the manufacture of sulphuric acid from its sulphides. This move was dictated largely, no doubt, by necessity; but largely also by the prospect of finding economic use for a wasteful and noisome product. In this sense, then, the fume agitation was a blessing in disguise; since it was the means of building up an important industry, which in one form or another promises to endure so long as the mines that gave it birth continue productive.

The ores most in use for acid-making are the simplest class of pyrite, carrying a large proportion of sulphur, and consequently of iron, but not much copper. An ore containing 45% sulphur has not been difficult to procure, either in Shasta or in other mining regions, but much material is burned for this purpose that carries considerably less. The average content in copper is hardly above 1%, although this percentage is exceeded from time to time. The expansion of the acid trade here, as in other parts of the United States, has reacted in such

a manner as to bring into use larger and larger amounts of base sulphides, but in California the acid plants have not yet advanced to the utilization of zinc-bearing material as elsewhere. For many years, however, a notable amount of acid has been made from concentrated stamp-mill tailing, which offers the same advantage as the crude pyrite; but this source of sulphur is unimportant. For a good many years the acid works around San Francisco bay, to the number of a dozen, first and last, have drawn a good proportion of their ore from Shasta, so that the utilization of it is no new thing.

For reasons that are obvious to the initiated, the manufacture of acid at the mines of Shasta has never been undertaken. In this regard it is sufficient to say that as a ton of acid requires the sulphur of less than a ton of ore, and as the acid would require to be shipped, at much higher cost than the ore, the local manufacture would prove unprofitable. The character of the ore thus far utilized in acid-making is superior as regards its sulphur content, but the residual matters left after calcining are almost negligible, consisting of a large proportion of iron, with but little of copper, and quite low in the precious metals. In large quantities the residue (cinder) contains 1% or less of copper, together with about one dollar in gold and silver. Such material is almost too poor to pay for smelting, and is discarded at once. Several large dumps of such cinder are now to be seen at the various acid-plants around the Bay, awaiting the time when the advance of metallurgical skill shall create a demand for this kind of material. Meantime some attempts have been made to extract the soluble copper by lixiviating the heaps with water. The extraction in such cases hardly surpasses 30 or 40%, and therefore is not especially profitable.

Sulphides of better quality leave a cinder that is invariably matted. As an example there is the flotation concentrate produced by the Mountain Copper Co. at its large plant at Minnesota, on the Iron Mountain railroad. Of this material some 70 tons per day, containing 15% copper, were made from 500 tons of ore averaging about 2% copper. This concentrate, after roasting, was smelted into a rich matte, which was then bessemerized in the usual way.

We may pause here to note that this company was the first to adopt flotation, as it was the first to introduce pyritic smelting and other modern methods. Its transfer of operations to Martinez marked a decided advance, and was a step which is likely to have an increasingly beneficial effect upon the mining industry.

Besides the Mountain Copper Co., two other companies have taken up the flotation method, the Afterthought and the Bully Hill. In their cases the conditions are far less favorable, owing to the peculiar composition of their ores, which have been sufficiently described, so that it will be unnecessary to say more now than that they consist of heavy sulphides with so little gangue that the proportion of matter 'lifted' by the process is almost one-half. Thus there can be no proper concentration, since the value of the concentrate could not be more than twice

that of the original ore. It would necessarily consist of a granular mixture running high in zinc, which if sold to the zinc smelters would subject the other metals to heavy deductions. On the other hand, if sold to copper smelters the presence of the abundant zinc would be found objectionable, in either event heavy losses being incurred. To avoid these difficulties both companies have instituted modifications of the flotation process that are extremely interesting and well repay investigation. Working on almost identical ore the two have projected and partly worked out methods differing radically.

At the Afterthought, where more than \$500,000 has been expended in the construction of a splendid plant having a nominal capacity of 300 tons daily, the process consists in a preliminary pulverizing of the ore to a maximum of 40-mesh, and the floating of the sulphides, getting a product of 6% copper, with 30% and more of zinc. An unfavorable feature is the loss of two ounces of silver per ton, said to be due to the barite, which appears to contain that metal. This product, which amounts, roughly, to one-half the weight of the original ore, is dewatered and then dried in a revolving furnace, and, while still somewhat heated, is introduced into another furnace, this being a roasting-furnace in which a peculiar effect is sought. It being considered that as three sulphides, namely, those of copper, iron, and zinc, are present, and that the two former are more susceptible of oxidation than the latter, that by suitably governing the roasting the former might be provided with a skin of oxide by which, when subjected again to the flotation process, it would resist lifting, while the unattacked sphalerite would be raised and consequently separated from its associates. Accordingly, the slightly roasted material is again run through the cells, getting a zinc concentrate, while the cuprous material remains behind, and is gathered by itself. In this way two products are actually obtained, but without the distinct separation that was expected. It has been found practicable to get in experimental working a 35% zinc product, which is hardly satisfactory; but this product contained too much copper (about 2 or 3%) to lose; while on the other hand the copper product carried enough zinc to diminish its value appreciably. The success of the method depends upon the accurate running of the roasting-furnace. The matter of handling a furnace engaged in such delicate work as oxidizing only the surface of the iron and copper sulphides, while leaving the zinc sulphide intact, is unquestionably very difficult, and has given an able staff many sleepless nights; and there seems little room for hope that it will be accomplished in a commercial way. The apparatus is of the best, and its installation on such a scale shows the perfect faith of the management. It was found that a portion of the copper, through the application of too much heat or too prolonged subjection to the oxidizing effects, became sulphatized and therefore soluble. No trouble was found in recovering it from solution by the familiar method of precipitation on scrap-iron, but its effect upon pumps and pipes was said to have been serious. This objection, of course, is not diffi-

cult to overcome, while annoying for the time being.

The net result of the working at Afterthought has been the accumulation of over 7000 tons of flotation concentrate as yet unsold, of which 5000 tons is reported to contain 35% zinc, 4% copper, 6 to 8 oz. silver, and 30 to 40c. in gold. Another lot, estimated at 2000 tons, contains 22% zinc, 5% copper, and 8 oz. silver. What to do with this concentrate is a conundrum. Although there is a new and excellent reverberatory furnace just completed at the mill, it can readily be seen that no smelting method can deal with the problem on account of the excessive zinc. If favorable ores could be had to dilute the charge and bring the zinc down to a manageable tenor the stuff might be put through, but with a total loss of the zinc, and probably a poor recovery of the copper. There is no use in disguising the fact that the zinc must be eliminated before the other metals can be made available.

The method employed at Bully Hill differs from that described in that no roasting or other fire process is employed, but a kind of selective flotation is used, in which the two valuable products are obtained separately by the use of different kinds of oil, it having been found that they vary in their effects on this or that sulphide. Two froths are taken off, the one predominantly zinky, the other coppery. The foregoing analyses show the composition of the ore, but it may be remarked that the average proportion of sulphide in the ore thus far is 65%, the gangue consisting chiefly of silica, barite, and alumina. The zinc product amounted to one-third the weight of the original material, and assayed 45% zinc, with from 2 to 2½% copper; the copper product reached from 9 to 11% copper, with 15 to 17% zinc, and amounted in weight to 8 to 10% of the original ore. From this one would infer that the saving in copper was about one-half only, since the zinc smelters could scarcely be expected to pay for the quantity left in the zinc product, added to which the zinc in the 20% copper concentrate would not only be a total loss, but would subject the shipments to a penalty.

Hardly satisfied with the results of these attempts at flotation, the Bully Hill company has worked out a method of zinc recovery which parallels that employed for a time at the Mammoth works. The latter in 1918 made some 800 tons of very pure electrolytic zinc, the greater part of which sold under the designation of 'premium spelter' for a very high price, exceeding that paid for any distilled brand whatever. The idea that zinc can be made by electric means under the conditions prevailing in Shasta county needs no further demonstration, nor is it necessary to inquire why the Mammoth works ceased production after making so good a start. So far as can be now seen the mining and metallurgy of zinc ores present almost the only means of keeping up mining activity in that region.

THALLIUM COMPOUNDS are widely distributed, but in very small quantities. The flue-dust of sulphuric-acid plants is still their only practicable source.

Technical Writing: Style

By T. A. RICKARD

*Technology has no recognized rank in what is called polite literature; the subject-matter of engineering is not supposed to lend itself to artistic treatment; we are the hewers of wood and drawers of water to the high-priests of learning who live on the cold summit above our humbler dwellings. Therefore the hierophants smile at the notion of 'style'—"that curiously personal thing"—in technical writing. The "great art" of Pater, the "inevitable phrase" of Raleigh, the "note of distinction" that Arnold demanded, are said to be beyond the scope, as they are supposed to be beside the need, of a writer on geology or engineering. This is a narrow view. Science, no less than *belles lettres*, calls for the highest flight of the human intelligence; the art of writing should be employed as skilfully and as thoroughly in a description of the structure of the Sierra Nevada, or of the construction of a tunnel through the range, as in a rhapsody welcoming the rosy fingers of the dawn.

The idea still lingers that fine writing does not befit technology, even though the masters of the Victorian period—Huxley, Tyndall, Ruskin—proved that science is worthy to be arrayed in the best robes that the looms of thought can weave. At the beginning of these lectures I quoted Barrie's remark touching the inability of the scientific man to express himself. That imputation has been passed to the technologist, whose utilitarian pursuits are supposed to make him too clumsy for the refinements of human speech. We may not have acquired the self-consciousness of those writers on Art whose "power of expression is so cultivated that their sensual caterwauling may be almost mistaken for the music of the spheres"; nor can we imitate the politicians, who have the ability to speak far beyond anything that they may have to say; but we too have a literature, a literature that is a gold mine of human experience, and we have a conscious aim to use our great inheritance, the English language, in furthering our purpose. Therefore, I submit, we are justified in discussing a matter even so recondite as 'style'.†

The engineer joins the essayist, the historian, and the poet in bowing to the greatest of all definitions of style:

*Another chapter from the forthcoming book on 'Technical Writing', to be published by John Wiley & Sons, New York.

†"The word 'style' is derived from the instrument (stylus) of metal, wood, or ivory, by means of which, in classic times, letters and words were imprinted on waxen tablets. By the transition of thought known as metonymy the word has been transferred from the object which makes the impression to the sentences which are impressed by it, and a mechanical observation has become an intellectual conception." Gosse. 'Encyclopedia Britannica.'

Buffon's "*Le style est l'homme même*"—style is the man himself. Good writing is natural; great writing is sincere. Artificial rules can no more furnish style than a man "by taking thought can add one cubit unto his stature." Not long ago I had the pleasure of editing an article on the discovery of cyanidation contributed by one of the originators of that process. The article was written without affectation, with a directness and a charm characteristic of the author of it. A correspondent in Australia wrote saying: "The charm of which you speak is characteristic of all good writing, whether on familiar or professional subjects. One might also conclude that such qualities of sincerity and kindness alone can account for literary excellence." The persons concerned in this story are not famous—it was not Tyrrell talking to Carlyle about Swift, for example—but the episode serves to explain Buffon's saying "Style is the man himself." Buffon also said: "Ideas alone are the foundation of style," and Stevenson left a saying that is worth many rules: "If a man can group his ideas, he is a good writer." Without the ideas to bind his assorted facts, the writer fares no better than the Israelites in Egypt when they were expected to make bricks without straw. Given the ideas, the next step is to group them so as to achieve that "perfect lucidity" which Carlyle imputed to Swift. Then comes the search for the fitting word—"le mot propre" of Flaubert—the word that belongs to the thing described, the precise epithet. This was one of Shakespeare's great gifts. So, working backward, we have the proper word, the word in its right place, the idea that gives life to a sequence of words, and, behind all, the soul of a man.

You may have heard of the author that was obsessed by an unattainable ideal of style. James Huneker tells us that he dreamed of "long sweeping phrases, drumming with melody, cadences like the humming of slow uplifting walls of water tumbling on sullen strands." Do not permit yourself to entertain such an idea; it is not within the province of the technical writer, and will lead only to insincerity. Sincerity is the keynote to good writing. Those "lines of chiseled beauty" will come if you attend to the fundamentals and abstain from rhapsody. Anything like a personal or distinctive style cannot be acquired until you have trained yourself to control the gift of expression.

This advice on 'style' may seem premature; it may be like some other "road-maps to Parnassus that are useful only after you have got half-way up"; but I repeat: be natural; be yourself; shun artifice; avoid affectation; say frankly what you know or what you have observed; use only words the meaning of which you know; avoid purple patches and rhetorical confectionery. Group the com-

position about the central idea. Be satisfied with short sentences until you have gained the experience that enables you to swing the longer ones dexterously. As you gain experience, vary the length of your sentences; the crisp sentence is a relief; the long and resonant period is delightful. Make the thought consecutive and place the sentences in such order that the succession of ideas leads naturally to a definite conclusion.

Not all engineers are graduates of a university, and many of those who have been so fortunate as to receive a liberal education are not well trained in the use of their own language; they have not had such a training as is founded upon a knowledge of the languages of antiquity, supplemented by careful reading of the English classics. To appreciate good writing keenly is a stimulus to developing one's own style. Such preparation is valuable, but it is not essential to the ordinary technical writer, provided he makes the most of his schooling and tries sincerely to avail himself of the means of expression at his command. University education rarely succeeds in producing men that write succinctly; intelligence and care—which is the supreme mark of intelligence—can accomplish great things.

Two examples will illustrate my argument. Several years ago I had to edit a long and detailed description of a metallurgical device and the operation of it. The article was eminently practical and businesslike. The subject did not permit any literary pose, yet the article evidently was the work of a capable craftsman. I found that it needed scarcely any editing, and when it was published I referred gratefully to the excellence of the writing. Happening to discuss the incident with a friend, I was asked by him to guess for what occupation the writer had been trained, and I said: "The ministry." This guess happened to be right, for the writer had been to Oxford and was intended for the Church before he wandered into a cyanide mill. The article bore the marks of the writer's training; a quiet command of English and a masterful use of it, making a difficult bit of technical exposition as clear and interesting as the subject permitted; and since "the home of lost causes" is not my *alma mater*, I may be permitted to acknowledge the value of Oxonian English in the literature of science.

My other example differs less than may appear at first sight. I have in mind an article describing mining conditions in a Central American republic. Such descriptions are usually made as verbally florid as the vegetation of the tropics and as involved as the jungle itself; at best, it is customary to bespatter them with unnecessary Spanish words and to deal in gorgeous generalities befitting the unlimited mineral resources of an inaccessible region. From these common faults this article was free. The sentences were short and to the point. The statements conveyed information without exaggeration. The writer kept what he knew at first hand separate from what he had merely been told; he gave just the information for which the average intelligent reader would ask, and a touch of humor was not lacking in his references to the queer things that happen on a Central American

frontier. It was like the sensible talk of an intelligent traveler who has kept his eyes open and his notebook handy. The writer had not received a special training in the language of his own country nor in that of another; as a graduate from a technical college in Michigan he had acquired rather more of contempt than of love for the use of proper words in proper places, and yet, by dint of native intelligence and the desire to do his task well—the true professional spirit—he had succeeded in preparing an article that in its way was as good as that of the Oxford man. Both men were unaffected, both kept in mind the purpose of their writing, and both knew what they were talking about. The moral is that bad writing is due to insincerity, carelessness, or ignorance.

In the matter of the relative pronouns, as in that of preposition-verbs and hyphens—indeed, in almost everything concerning which I have endeavored to instruct you—you will find examples—even authority—to the contrary. Writing is a flexible instrument of expression, and the same thing can be said in many ways. The great art is to write the thing in the way that makes it most easily understood by the reader—the particular reader or the class of readers for whom it is intended. In order to learn, we must, of course, look backward for precedents and for critical judgments, but we should also occasionally turn and look forward, and in that forward looking we should keep our eyes on the purpose of our work. Whether one great writer fail to distinguish between relative pronouns or another use preposition-verbs like a German, does not matter greatly unless it hinder us in writing clearly on technical subjects. Amid the distortions of English and the uncertainties of rhetorical doctrine we shall not cry despairingly "Whither are we drifting?" Rather let us ask hopefully "Whither shall we steer?" The answer is prompt: "Out of the fog, into the sunshine of clear plain English."

Technical writing rarely conforms to the higher requirements of literature, largely because it is difficult to persuade technicians to conform to the lower requirements of plain scientific statement. George M. Wood, the editor of the U. S. Geological Survey's publications, confesses that "the purist or stylist would not be satisfied with the work done. The split infinitive may remain, unless it is very awkwardly split; the doubtful singular or plural may go unchallenged—whether three feet of sandstone *are* seen or *is* seen makes no difference to the editor so long as the verb is everywhere seen in the same number in the same paper; the restrictive 'which' that might be 'that' may go to print unless it conveys or suggests a wrong idea; 'whose' may be used for either persons or things without editorial protest, if not with commendation. Whether something 'had better' or 'would better' be done; whether work was 'commenced' or 'begun'; whether the indicative should be used where a writer of the old school would prefer the subjunctive are questions that consume none of the time of the editors. Great latitude of expression and of style must be allowed, and the individuality of the author must be preserved—unless his individuality should consist

principally in the repetition of faults of the kinds here described."

In the course of these lectures, I have quoted many examples of bad writing. You will have noticed that most of the faults criticized are due to carelessness rather than ignorance. Thoughtlessness is fatal in matters that demand thought. Slovenly writing is the result of slovenly thinking, for "slovenly habits of expression corrode the very substance of thought."* It behooves us to remember that language in relation to ideas is a solvent, the purity and clearness of which affects the matter in solution. Whewell, in the 'Philosophy of the Inductive Sciences', has expressed this view with noble eloquence: "Language", he said, "is often called an instrument of thought, but it is also the nutriment of thought; or rather it is the atmosphere in which thought lives; a medium essential to the activity of our speculative powers, although invisible and imperceptible in its operation, and an element modifying, by its qualities and changes, the growth and complexion of the faculties which it feeds."

In considering this phase of the subject there comes to mind a suggestion that takes us far beyond the confines of the matter under discussion. Man's power of speech appears to divide him from all other living things; at the same time the imperfection of it weighs him down continually with the sense of an essential frailty. To be able to express oneself perfectly would be divine; to be unable to make oneself completely understood is human. In 'Man's Place in Nature' Huxley points out that the endowment of intelligible speech separates man from the brutes most nearly resembling him, the anthropoid apes, to whom he is otherwise akin in substance and in structure. This endowment of speech and the art of recording himself in writing enable man to transmit the experience that in other animals is lost with the individual life; they have enabled him to organize his knowledge and to hand it down to his descendants, first by word of mouth and then by written words. If the experience thus recorded were properly used, man's advancement in knowledge and in conduct would allow him to emphasize, much more than at present, his superiority over the dumb animals. Considered thus, language is a factor in the evolution of the race and an instrument that works for ethical progress—it is a gift to be cherished as the ladder by which man has climbed from his bestial origin and by which he may ascend to a loftier destiny, in which, ceasing to stammer in accents that are but the halting expression of swift thought, he shall unfold his mind in the fullness of speech, and, neither withholding what he wants to say nor saying what he wants to withhold, shall be linked to his fellows by a perfect communion of ideas.

IN SOUTH WALES zinc-dust has recently been manufactured from metallic scrap, forming a product containing about 95% of active zinc, compared with approximately 85% for the by-product from the retort process.

*Allbutt.

Mining in Oregon

The bullion receipts from Oregon at the mint, smelters, and refineries at San Francisco show a falling off of \$221,000 in gold and 5443 oz. of silver for the first six months of 1919 as compared with the corresponding period of 1918, according to Charles G. Yale of the U. S. Geological Survey. Although the U. S. Assay Offices at Boise and Seattle, and smelters at other points receive considerable gold from Oregon, the receipts at San Francisco indicate the general condition of the mining industry there. The reduction in output in Oregon is similar to that in other Western States, where high costs and scarcity of labor have affected adversely the metal-mining industry by closing down some mines and curtailing the operations of others. The statistics of the year 1918 for Oregon show a total reduction in value of the output of all metals of more than a quarter of a million dollars compared with 1917, which was, perhaps, less than might have been expected in view of the prevailing conditions in the mining industry. The gold dredges alone, which produce 78% of the total placer gold and 39% of the total gold, show a combined reduction in the output of gold of more than \$250,000. The largest three quartz mines produced \$77,000, and the largest hydraulic mines produced \$10,000 less than in 1917. The principal copper mine in the State, however, materially increased the value of its output, and fully one-third more mines reported production than in 1917. Most of these added mines were small ones, operating temporarily, and mainly in camps where mining had been carried on for years. Some old dumps were utilized and more or less sniping and desultory placer mining was carried on in the gulches, ravines, and small streams in many mining regions.

The most productive copper mines are the Homestead Iron Dyke, in Baker county, and the Queen of Bronze, in Josephine county. There are four smaller copper producers in Baker county and three more in Josephine county. Small quantities of lead are produced in Baker, Jackson, and Lane counties. No new large mining operations have been started and brought to the point of production in Oregon within the last year and a half, except perhaps, the Oregon Dredge Co., in Grant county, which began operations late in 1917 and still continues. The Continental Mining Co., 23 miles from Sumpter, has put up a 20-ton flotation plant to treat high-grade gold-silver ore.

Owing to the high prices of machinery, labor, and mine supplies, little activity is being shown except at the established productive properties. With an appropriation of \$50,000 by the Legislature, the Oregon Bureau of Mines is again at work after a period of inactivity in field work and publication during the War. Work in southern and western Oregon is now being done by the Bureau; work in the eastern part of the State is done in co-operation with the U. S. Geological Survey. The results of the work will be published in bulletins of the Oregon Bureau of Mines.

Flotation in Stages

By WILL H. COGHILL

*Early workers regarded flotation as a process of ore concentration that could be applied to any sulphide, however finely ground, but limitations have since been encountered. The grinding-and-flotation circuit is now receiving more serious attention. Already the limitation upon the degree of fine grinding has been admitted in technical literature by writers who have indicated the importance of stage-grinding to avoid excessive losses in the finest material.

Grinding in stages, as commonly used in flotation, is identical with that adopted in cyanide practice where the grinding unit consists of a mill in closed circuit with a classifier. Stage flotation is new to me and I present this paper in order to draw expressions from others who are interested in this subject.

Much has been said about the desirability of grinding to such a degree that the last grains of the economic minerals are unlocked from the gangue. In flotation such a procedure in grinding is likely to change only the nature of the loss. If the ore be of such a nature that it requires grinding through, say, a 120-mesh screen in order to avoid loss of locked grains, and if the sulphides finer than, say, a hypothetical 800-mesh are lost, the worker finds himself within embarrassingly narrow limits. In crushing through 120-mesh, to avoid loss in locked grains, many of the free and floatable mineral grains of, say, 60-mesh are so unnecessarily finely ground that a part of them is irrecoverable. This condition may be combatted effectively by stage flotation.

Stage flotation is repeated flotation where the rougher-underflow is classified and re-ground between successive flotation stages. It embodies adequate classification in which the ordinary closed-circuit stage-grinding may be a part.

In November 1918, assisted by J. P. Bonardi of the Golden station of the U. S. Bureau of Mines, I found evidence of the advantage of stage flotation at the molybdenum mill of the Primos Exploration Co., at Empire, Colorado, and the flow-sheet was accordingly modified. As a result of this change, and as a result of a change of oils, the recovery was increased approximately from 60 to 80% in November and to 83% in December. The screen analysis of the tailing that left the mill was not intentionally altered, but the diminished grinding that preceded flotation permitted the recovery of large floatable grains, which would have been subjected to excessive grinding in the former system.

After changing to stage flotation, as stated above, there remained a troublesome condition that could not be removed without a complete re-modeling at the head of the mill. A sample of the feed to the Marcy mill indicated that only 4.6% passed a 40-mesh sieve, but it contained

11% of the molybdenum content of the ore. This fine material, if practicable, should have been sent direct to the flotation cells but the system as installed required subjecting it to excessive grinding in the presence of 3-in. material in the grinding-mill. The loss of over-ground molybdenite therefore continued higher than if this preliminary separation had been made.

Stage flotation linked with appropriate grinding and precisely adapted classification will come more and more to the fore. It is a common occurrence to find the grade of the tailing increasing persistently with the grade of the feed. I believe that from a metallurgical standpoint this persistent increase in the tailing may be practically removed and that from a commercial standpoint much may be accomplished.

I have been inclined to the opinion that any sulphide can be ground so fine that it is not floatable. Molybdenite was taken as a striking example, though it was believed that its refractory nature would be exaggerated or minimized according to the type of the flotation machine, or to other variables. What I have proved is that an amenable molybdenite ore may be made refractory by excessive grinding; others have noted the difficulty arising from excessive fineness of the charge.

Stage flotation and better classification should be considered where the loss in tailing is segregated in the excessively ground material.

Two possible objections to stage flotation may be mentioned. First, floatable locked grains by entering the concentrate reduce its grade. Second, the re-ground 'sand' returned to the rougher reduces the capacity of that machine for virgin ore in proportion to the amount of sand returned. On the other hand, stage flotation has the advantage of furnishing a coarser concentrate to the smelter.

THE OPERATIONS of prospectors in the neighborhood of Mapimi, in the State of Durango, have led conclusively to the belief in Mexican government circles that there exist large and important oil deposits in that vicinity. Already on the basis of these explorations several claims have been filed in the Department of Petroleum of the Secretariat of Industry, Commerce and Labor, and the concessions have been granted. The action of the Government in conceding titles is in accordance with the prevailing laws which allow the conferring of titles to lands in vicinities which have not yet been opened up for exploitation. Further concessions for new wells will not be granted in regions where petroleum is now produced, pending the enactment of the proposed petroleum laws which are now being considered by the National Congress. The new oil region is adjacent to the important mining sections of Velardeña and Pedriceña, within easy reach of Parral and Torreon, and there is good railway connection with Monterrey and in the industrial region thereabouts. It is understood that the concessionaries have already taken the first steps toward obtaining necessary drilling machinery, and it is expected that active operations will soon be in progress.

Mining at Braden

By FRANK CAMERON

INTRODUCTION. Within the next few months a complete article will be published dealing not only with all the different methods of mining used in the various mines of the Braden Copper Co., but also describing the mountainous environment of the mine, its early history, the Chilean peon as a miner, the system of hiring and firing, the cost system, the welfare work for employees, and many other interesting features. Anticipating this publication, I shall only attempt to make a few remarks on the new method of shrinkage stoping, as employed at the Teniente mine.

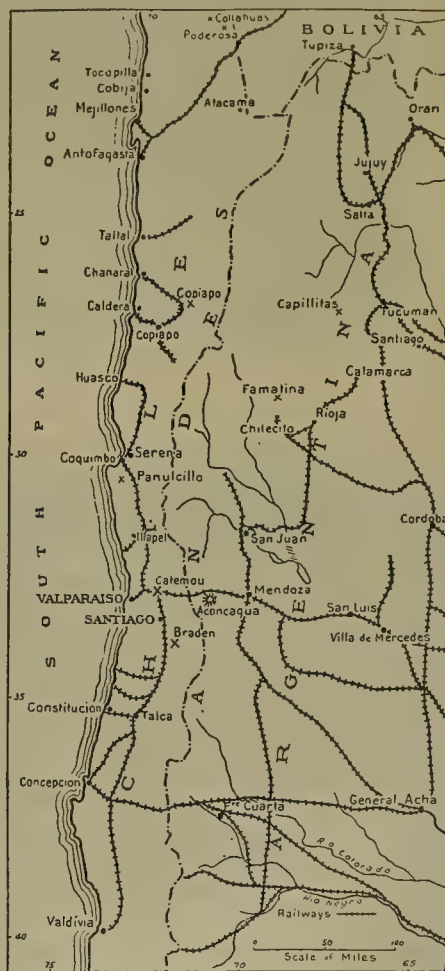

EARLY HISTORY. The tradition goes that the Teniente mine dates back into the 18th century, when a Spanish lieutenant, who was a fugitive from justice, escaped to the snow-crowned Andes in eastern Chile, where he camped at what afterward became known as the Mineral Teniente. This man is said to have discovered a vein of high-grade ore, and from the proceeds acquired by selling certain shipments of ore, he paid a fine to the authorities, who then freed him from further difficulties with the colonial government. Be this as it may, the first official records date from 1819, when the working of the mine was undertaken by Don Juan de Dios Correa, Conde de la Conquista, and owner of the immense hacienda stretching from the coast range of the Chilean Andes to the Argentine boundary, within the limits of which the mines are situated. Don Juan de Dios exploited the mine until the early 'seventies of the past century, transporting the ore on muleback to the coast for exportation.

Partners were taken into the enterprise and one of them, Don Frederico Gana, a graduate of Freiberg, became manager. He drove what is known as the No. 1 adit and also sunk about 100 metres of shaft No. 1. Owing to the heavy snow-fall, all work was suspended during the winter, beyond keeping the shaft unwatered. According to one version, the mine-boss and the miners, during one of the winters, stole practically all the tools and equipment that could be carried off, so that in the following spring the owners found the shaft full of water. Whatever may have been the cause of the shaft filling with water, money was then required to get the mine into a state of production. The money not being forthcoming, the mine was abandoned, and the taxes left unpaid.

In 1897 Don Enrique Concha y Toro sent a prospector to the district, and after taking up claims to cover some of the most promising outcrops, including the old Teniente mine, he proceeded to sort high-grade ore from the old stopes, and sell it. At this juncture a lawsuit ensued between Don Enrique and Don Carlos Irarrazaval, who

had married into the Correa family and was protecting their estate. When their difficulties were settled, Don Enrique received a third interest in the Teniente mine, together with the sole proprietorship of all the other mining claims that he had taken up there.

The Correa heirs were not inclined to invest any money

MAP OF PART OF SOUTH AMERICA, SHOWING THE POSITION OF BRADEN

in the property, and as Senor Concha y Toro did not care to open up a mine in which he only had a third interest, he began development work on some of his other claims, most of which was done on the so-called Fortuna mine. Sr. Concha y Toro was looking for high-grade copper ore and upon finding ore only running about 4% copper

and well disseminated in the country-rock, which meant concentration, he became somewhat bewildered as to what should be his next move. He sought the advice of a noted Italian mining engineer by the name of Don Marco Chiapponi, who recommended the construction of a concentrating plant. As this not only meant the construction of the concentrator but also a wagon-road, power-plant, and other equipment, Sr. Concha y Toro decided it was more money than he wanted to invest in a low-grade mine and entrusted Chiapponi with the sale of the property.

Chiapponi sent about 25 tons of the ore to Europe to be tested as a concentrating ore; and as these tests proved successful, the business was submitted to mining capitalists in France and England. Several foreign engineers were sent to inspect the property, but apparently they did not grasp the magnitude of the orebody and they reported adversely on the mine. About two years later, Sr. Chiapponi consulted William Braden, who, after a careful examination of the property, became favorably impressed with the project. Mr. Braden then interested his friend E. W. Nash, since deceased, but then president of the American Smelting & Refining Co., in the organization of the Braden Copper Co. for the exploitation of the property with a cash capital of 625,000 dollars. With this money a small 250-ton concentrating mill was built, also a wagon-road from Graneros, the nearest point on the State railroad to the mine; three aerial trams were constructed; a hydro-electric plant of approximately 100 hp. was added; living quarters at the mine and mill were provided; and the opening up of the mine was started. It reflects great credit on William Braden and his staff for completing this work within the limits of the estimated cost, in view of the fact that this was the first undertaking of its kind in the Chilean Andes, where the heavy snows of the winter are apt to shut-down construction work for weeks at a time.

The mill started to work in June 1906. The opening up of the mine was commenced, most of the ore coming from some small high-grade pockets in the vicinity of shaft No. 1 or in the so-called fumarole country. From 1906 to 1913 very little was done at the Teniente mine, as the Fortuna mine had become a producer and could always keep the bins full of ore. Most of the work at the mill and smelter was of an experimental nature and very seldom was the mine called upon to produce over 2000 tons per day. As the Fortuna mine could produce all the ore necessary and as money was rather scarce for such low-grade deposits, not much work was done in developing the Teniente deposit. Generally during the summer some 50 or 100 men would be put to work in the Teniente No. 1 adit, but as soon as the first signs of winter appeared, these men were transferred back to the other workings. It is quite a well-known fact that certain engineers employed by the New York office reported unfavorably on doing any development work whatever on the Teniente mine, as they stated that surface indications and all other information such as can be gathered from a visit to the deposit proved to them conclusively

that although there was a large deposit of mineralized rock, still it never would be mined as ore, as it assayed not over 0.5% copper. The local officials of the mine, Robert Marsh, Jr., Edwin S. Berry, and H. R. Graham, submitted equally as strong an argument that there was a high-grade deposit of, say, 2% copper; but they were unable to drive their point home, until finally they decided to develop the mine with their own capital in return for 10 cents per ton on all ore so developed. This proposal was taken up by the general manager and his respective immediate superiors, and the contract was practically ready for signature when ill fate interfered and there was a change of management. It is needless to relate the remarks of the local officials, and how they thought another chance to play the rôle of Wallingford had slipped from them.

From 1913 to 1915 the work at the Teniente mine was pushed with considerably more speed, completing the driving of the Teniente No. 1 adit completely around the crater to connect with Fortuna No. 2 adit. Some work was started on Teniente C adit from the surface, during the latter part of this period and shaft No. 2 was practically completed except for the timbering.

It was not until the latter part of 1915, when the Braden Copper Co. was taken over by the Kennecott Copper Co., that the opening up of the Teniente mine to such an extent as to become a producer was found necessary in order to supply the ever-increasing demands of the mill and smelter, which by this time had grown far beyond the capacity of the mine, as regards supplying the requisite tonnage. Immediately some 200 to 300 men were put to work and level after level was opened up from Teniente No. 1 to Teniente J, or eleven in all. It was the desire of the management to reach the uppermost levels, where caving methods could be employed without the danger of making any appreciable admixture of waste with the ore; but until this point was reached it was necessary to produce from 1500 to 2000 tons of ore daily, which ore must come from shrinkage stoping.

Certain sections on Teniente 1, C, E, and F levels were selected for stoping-areas, the general custom being to run two to four regular 7-metre (23 ft.) stopes with the regular 5-metre (16.4 ft.) pillars and then leave a block of ground about 100 m. (328 ft.) thick before starting another series of stopes. In this way absolutely no harm was done to future operations and yet a considerable daily tonnage was obtained until the caving sections could be opened up and prepared for caving.

PRESENT SYSTEM OF MINING. Some four years ago, at which time the dimensions of the orebody were not definitely known, it was decided to develop the true limits of the orebody by means of cross-cuts driven from a series of hanging-wall drifts placed 50 m. (164 ft.) vertically one above the other, this 50-m. interval constituting the vertical distance between levels. These drifts followed more or less the contact of the Teniente breccia and the tuff, and were driven in a series of tangents that were connected by short and rather high-degree

A SNOW SCENE IN SEPTEMBER 1918, SHOWING THE HOUSES OF THE AMERICAN TOWN-SITE ALMOST SUBMERGED

THE SNOWSLIDE OF 1914 IN WHICH SEVERAL LIVES WERE LOST. RESCUE PARTIES ARE SEEN DIGGING FOR THE VICTIMS

curves, in order to follow the periphery of the crater with as much straight drift as possible.

Upon ascertaining the true width of the orebody, it was decided to drive a barrier-pillar drift every 100 m. (328 ft.) in order to acquire speed in opening up and to

neering department and they are started both toward hanging and foot-wall. With the completing of a cross-cut, then, the stope-raises, which are 20 ft. centre to centre, are marked off and started. The first round is generally shot onto the floor of the cross-cut; whereupon

PLAN AND SECTIONS OF THE PROPOSED GATHERING SYSTEM FOR THE TENIENTE OREBODY

keep all development work in ore. These drifts are numbered from hanging to foot-wall and are parallel to the longitudinal axis of the orebody. The caving sections of the respective levels having been reached by these drifts, the cross-cuts are marked off immediately by the engi-

the standard 10 by 10-in. pine sets are placed in position and chutes are built in. All sets are at 5-ft. centres and are 8 ft. high by 7 ft. wide. These dimensions vary a few inches with the different sizes of timber. After completing the first two stope-raises, which are driven at 45°

and for 4.50 m. (14.8 ft.), the connecting operations are started. These are nothing more than the joining of the various stope-raises by means of a 7 by 7-ft. cross-cut driven parallel to the main cross-cut but along the centre-line of the stope. The right-hand side-line of the stope is practically over the left-hand side-line of the cross-cut. When 'connecting-up' operations are half completed, the actual shrinkage-stoping operations are started. The first few rounds are designed to open up the stope to full width. It has been proved at this mine that the above-described method of connecting-up is not only the fastest but also the cheapest in getting a stope to the producing stage; the great advantage being the definitely determined side-walls from which to enlarge so as to ascertain the true side-walls of the stope, because this affords an ideal opportunity for the proper spacing of holes from the very beginning of each and every stope. To a great extent this one feature is highly responsible for the increased breakage from about 40 tons per machine-man shift to between 60 and 70 tons per machine-man shift, this last figure often running as high as 85 tons. The stopes are provided with from 4 to 6 machine-men per shift and the stope is rushed to a point 7 m. (23 ft.) vertically below the floor of the next higher level. Most stopes are completed within six weeks, and 40% of the broken ore is recovered for immediate tonnage.

METHOD OF HANDLING ORE. The greatest innovation introduced into the mining at the Teniente mine, as regards that at the Fortuna mine, has been in the handling of the ore. By means of an ore-pass gathering system, designed by H. R. Graham and his immediate associates, tramming the ore by the use of cars has entirely been dispensed with, except for a small tonnage coming from development headings. The orebody has been blocked out and ore-passes designed to gather certain sections, such as can be seen upon the accompanying section. The ore-passes are laid out in systems and are numbered like the barrier-pillars drifts. Each system comprises four main ore-passes, 14 legs, and 24 branches, making a total of 42 ore-passes, legs, and branches per system, or 732 m. (4401 ft.) in all. All main ore-passes are driven at 55° and are two metres square, whereas the legs and branches vary in slope from 55 to 60° and are driven 1.5 m. square. One system gathers seven cross-cuts for a width of 60 m. These ore-passes, legs, and branches break into the various cross-cuts at points 10 m. (32.8 ft.) centre to centre, one from the other. All dumps are built two metres wide and four metres long, so that the longest possible distance one chute could be away from a dump would be three metres (9.8 ft.). By a series of bottom-dump chutes for those passes that practically come over the various dumps, and by a series of incline chutes taken out of the side and back for those passes that are intermediate between dumps, the handling of the ore is controlled by a squad of *compuerteros*, or gate-tenders. All the branches feed into the various legs and all the legs feed into the four main ore-passes, which gather at one common dump on the succeeding level. From this point the ore is

handled by a series of control-gates, spaced every 50 m. (164 ft.) apart or at more frequent intervals, provided the ground is of a highly fractured type, to the main haulage-level, where it is dumped into 20-ton cars and trammed by means of 25-ton D. C. electric motors directly to the coarse-ore bins. The advantages to be derived from this method of handling ore over that formerly employed, by tramming with one-ton cars, are: (1) greatly reduced amount of track, tins, etc., using none except for developing purposes, and using them over and over again; (2) no maintenance of track; (3) no cars except as needed for development work; (4) no maintenance of cars; (5) no car-men, which type of Chilean labor causes the most trouble and is rightly named the 'fly-by-night' element; (6) greater extraction with cheaper maintenance as regards timbering, as often several posts in the centre of cross-cuts are jackknifed before all the ore beyond them has been extracted. With this system it is only necessary to keep the cross-cut open sufficiently for a passage for the workmen; (7) weakening the orebody by the wear of the ore through the ore-passes, so as to cut down the height of the stopes on all subsequent levels after the first sections have been caved; (8) increased tonnage in driving ore-passes, legs, and branches in ore, which tonnage practically pays for the driving of them.

The only disadvantages are the danger in raising so many ore-passes and the delay due to certain systems being hung up on account of a plugged ore-pass. However, all these ore-passes are raised in short lifts and first-class ventilation is maintained through the driving of them; so that the first disadvantage is avoided. Owing to the great number of systems, any one system can be stopped for several hours without materially affecting the daily tonnage from the mine. While to date this system of handling ore has not been sufficiently tested to ascertain the true cost per ton of ore, still it has been conservatively estimated that at least a reduction of 5 cents per ton of ore can be made on the cost-sheets when this system is employed throughout the mine.

In closing this article, I wish to commend the company and local officials of Braden very highly for the way and manner in which they have conducted business in a foreign country. The laborers have been provided with better homes than previously enjoyed in the capital city, namely Santiago; their working hours have been shortened 50%, they now are enjoying the 53-hour week; the cost of living has been held down while wages have been advanced; schools have been provided for the native children and the married man given preference over the single man; all forms of amusement, such as motion-picture theatres, gymnasiums, club-houses, playgrounds, ball-parks, and tennis courts have been furnished by the company; first-class hospitals have been built and a medical treatment offered to all employees at a minimum charge of one dollar per month; and yearly bonuses amounting to 10% of a man's yearly salary are given to each employee that has worked 300 days out of the possible 365 days of the year.

REVIEW OF MINING

ARIZONA

CONDITIONS AT DOUGLAS AND HUMBOLDT.—MORENCI PLANTS
TO BE RE-MODELED.

DOUGLAS.—The Calumet & Arizona smelter here showed a slight increase in production in August over that in July, but this was said at the smelter to be more or less accidental, as no effort to speed production is being made at the present time. The one department now working at full capacity is the acid plant, which supplies the New Cornelia at Ajo with acid for use in its flotation process. The acid production, now at top notch, increased about

and will have an initial capacity of 2000 tons per day. It has been announced that a five-compartment shaft will be sunk while the mill is under construction. New hoisting and tramming equipment, electrically driven, also will be installed. A vigorous campaign of underground development will be started at once. The smelting plant also will either have to be extensively re-modeled or entirely re-built in order to introduce economies vital to the operation of the property on account of the decreasing grade of the ore. Under the present system it would be impossible to operate longer at a profit. In order to make the contemplated changes the company must expend be-

SMELTING PLANT OF THE CALUMET & ARIZONA MINING CO. AT DOUGLAS

1000 tons during the month, the total made being approximately 6000 tons.

HUMBOLDT.—The Consolidated Arizona Smelting Co. of Humboldt authorized the following statement: "From the Blue Bell and De Soto mines of this company a total of 12,200 tons of ore was shipped to the Humboldt reduction works; our concentrator handled 8450 tons of material, while the smelter proper treated 7000 tons of new metal-bearing ores and concentrates during August. In that month we made shipments of 650,000 lb. of fine copper in bullion to Eastern refineries, the majority of which was derived from domestic ores."

MORENCI.—It has been decided by the Phelps Dodge Corporation to build a new mill for the treatment of its Morenci ores. The exact location of the mill has not been decided, but two possible sites are under consideration. The concentrator will be constructed in 1000-ton units

tween \$2,500,000 and \$3,000,000. The announcement was made that, as a preliminary to new construction, the property would close down all departments September 6. This meant, of course, rendering idle several thousand men, but construction work will be rushed and, so far as possible, old employees will be used so as to hold the force together until operations can be resumed. When the contemplated improvements have been completed it is expected that operations will be resumed with an increased force.

COLORADO

OPERATIONS AT CRIPPLE CREEK AND LEADVILLE.

CRIPPLE CREEK.—The highest grade of ore now being shipped from the Cripple Creek district is coming from the Index mine on the western slope of Gold hill, owned

by the El Paso Extension Corporation. The ground north of the shaft is under lease to the Beacon Mines Co. An ore-shoot under development from the 400-ft. level of the Index shaft is breaking five to eight feet wide and producing ore assaying 2 oz. for coarse in carload lots and 5 oz. for screenings. Denman and Searles, operating individual leases on the Jerry Johnson mine on Ironclad hill, are both mining a good grade of ore and shipping steadily to the Golden Cycle mill. The Forest Queen Mines Co. is making regular weekly shipments of ore assaying about \$30 per ton. The Six Points mine of Stratton's Cripple Creek Mining & Development Co., under lease to C. A. Larson of Victor, is producing 50 to 60

of Twin Lakes, on Bull hill, a spur of Mount Elbert. The property is controlled by Charles J. Fox of Philadelphia. The vein is reported to be four or five feet wide and carries two streaks of high-grade ore from six to ten inches wide. The Harvey brothers of Denver and their associates are operating the Bowman and Dewar property in the Red Mountain district, 13 miles above Twin Lakes. They are saving and sacking high-grade silver ore. The same interests are also operating the Collins property, in Sayre gulch. A complex ore containing gold, silver, and lead is being mined and the outlook for a persistent producer is promising. The property is owned by George B. Collins of Leadville. The Mock and Hartman property

A GLIMPSE OF WARD, COLORADO

tons weekly assaying about 1 oz. Gorman and associates, operating a sub-lease from Anderson and Benkelman on the Trail, are expected to make a good profit on the money expended in sinking the shaft an additional 100 ft. and cross-cutting to the vein. The work was performed in record time.

Work is progressing on the 1250-ft. level of the Blue Flag, to connect with the Moffat tunnel and then through to the War Eagle consolidated property to the north. The drift is following a vein, but assays do not yet indicate profitable ore. Dividends were paid on September 10 by the Cresson Consolidated company and the Golden Cycle Mining & Reduction Co. at the usual rates of 10 and 3c., respectively. The Cresson dividend amounted to \$122,000 and the Golden Cycle to \$45,000. The Portland and Vindicator companies are expected to declare the regular quarterly dividends this month.

LEADVILLE.—Ore assaying from 3 to 7 oz. gold and 100 oz. silver has been cut by the heading of an old tunnel on the property of the Fidelity Mining Co., in the vicinity

in the Red Mountain district is active and the showing is excellent. A network of veins carrying visible gold has been opened by surface trenching and a tunnel is now planned to tap the veins at depth.

George Nichols and associates are operating the Sailor Boy mine in Lincoln gulch, on the Pitkin County slope, and are saving high-grade silver ore. The Ruby property in the same district, under lease to Koby and associates of Aspen, is under development and high-grade silver ore is being mined and shipped. This property paid with silver selling at 50c. per ounce, but has long been idle. The Miller Mining Co. has leased the mill, tramway, and upper workings of the Miller property to the Mount Champion Mining Co. The tunnel is to drive through the Mt. Champion holdings to cross-cut the ground 200 ft. below the old workings. The mill will be enlarged to a capacity of 200 tons per day, and with the large tonnage of low-grade milling ore in the Mt. Champion group made available it is expected that it can be kept in operation for an indefinite period. At a meeting of the Prospect

Tunnel Co. held here last week it was determined to resume operations. The Down Town Mines Co. is hoisting 400 tons of ore daily operating with three shifts. The water situation is held under control by the huge pumps at the Penrose shaft.

NEVADA

GOLDFIELD AND DIVIDE.—THE STRIKE SITUATION AT TONOPAH.

GOLDFIELD.—A. H. Lawry, superintendent for the Goldfield Consolidated Mines Co., has succeeded A. I. D'Arcy, resigned, as manager for the Wingfield companies at Goldfield. The Wingfield companies now operating are the Atlanta, Kewanas, Blue Bull, and Merger. William Sharp, assistant to Mr. D'Arcy, who had been in direct charge of these mines, will enter the employ of the Goldfield Development Co., according to present plans.

LOOKING FOR SOMETHING TO LOCATE

On September 11, A. I. D'Arcy, vice-president and general manager for the Goldfield Development Co., left for New York to consult with L. E. Whicher and associates on plans for financing the enlarging of the mill to 2000 tons daily capacity. Working with a small force, the company has completed a 500-ton bin at the main shaft and a 900-ft. spur track from the company railroad. Heavy mill machinery, such as thickeners, classifiers, and filters, are being shipped to the mill from the Consolidated plant at Aurora, which is being dismantled. A pipe-line is being laid from the shaft of the Silver Pick company to the main mill water tanks on Columbia mountain to provide an ample supply for the 2000-ton plant. Two electric storage battery locomotives, which will make a total of four, have been ordered for use underground and new electric generators for use with these have been ordered to replace the storage plant formerly used by the Consolidated. The Consolidated plant, which was designed to operate one 150-hp. motor for 8 hours, is considered obsolete. The cross-cut to the Florence is nearing completion and the next important work to be undertaken is the repair of the main shaft, which is

in poorer condition than was thought for a considerable distance above the 380-ft. or main haulage level. The pumps at the Grizzly Bear shaft have been overhauled and are now in good condition. Eighteen inches of ore estimated to contain 500 oz. of gold per ton is exposed in the back of a stope in the Florence Divide lease on the Florence. The shoot was opened in stoping low-grade ore 8 ft. into the hanging wall of the vein from which a shipment estimated to have been worth over \$90,000 was made. When first found it was less than 1 in. wide and reached the present width within a distance of 18 ft. Engineers who saw the vein from which \$90,000 was shipped and who have examined the more recent discovery are of the opinion that the latter will prove at least equally persistent. The rich ore is being broken for the width of the vein and stored. The last four carloads of lower-grade ore shipped from the lease have assayed \$30, \$60, \$62, and \$84 per ton, indicating the approach to the rich vein. All lease blocks in the Florence have been taken with exception of two.

The east drift on the 365-ft. level of the Great Bend is 425 ft. long and, according to J. K. Turner, superintendent, ore of shipping grade should be opened within an additional 100 ft., as within this distance the drift will be well under the stopes on the 236-ft. level. Drifts and raises on and above the 160-ft. level, in the oxidized zone, have resulted in ore of highly erratic grade being exposed. One drift was driven 275 ft. in the vein 60 ft. above the level. During a period of over six months the ore production, entirely from above the 160-ft. level, has amounted to 85 dry tons assaying \$21.48, from which the net

return was \$1103. During this period 655 ft. of development work was performed in all parts of the mine. In a cross-cut driven east from the main south drift on the 910-ft. level the Spearhead has exposed in the shale a vein of quartz 18 in. wide assaying from \$30 to \$35. The seam is 22 ft. long and is considered by R. S. Wilbur, foreman of the mine, to be the most persistent orebody opened on this level. Raising in the ore has been started.

DIVIDE.—The entire face of a drift being driven from the bottom of a 60-ft. shaft on the West Divide is in silver ore of shipping grade and indications are that the company has a highly promising prospect. The vein is from three to six feet wide and has been traced on the surface for 2000 ft. A shoot three feet wide in the back of the drift and narrowing to 22 in. in the bottom assays from 75 to 100 oz., with material on each side assaying 50 oz. Assays of 37 oz. are obtained for from 6 to 8 in. into the walls of the vein. A 5-ft. width averages 77 oz. as broken. The drift has been driven 10 ft. in the shoot, starting with from 18 in. to 2 ft. of ore assaying over 90 oz. Over a carload of ore is broken or in sight. L. L. Patrick of Goldfield is manager for the company.

TONOPAH.—After having taken a prominent part in the settlement of the Ely strike and in averting a walk-out at the Virginia City mines, Governor Boyle is in Tonopah attempting to settle the strike that has had the Tonopah and Divide districts tied up since August 17. On the night of September 8, speaking before 5000 people in the Tonopah ball park, the governor made it plain to the workers that the operators would not deal further with the present workers' committee, which is said to be controlled by the radical element. He said this committee was of no further use in conducting negotiations. The governor's speech was filled with caustic references to the I. W. W., which he said had "scabbed shamelessly on the job when the whole civilized world was on strike against an autoocracy that threatened to destroy every democratic institution." He threatened to use force to compel a resumption of operations if both sides continued to stand pat. An I. W. W. element is responsible for the trouble, according to all reliable reports in Tonopah. It is said this element engineered the strike against the will of the conservative workers and that a settlement cannot be reached while the radicals remain in control. The best miners have left both districts in large numbers. Through fear of becoming involved in the trouble, the Goldfield Development company at Goldfield, 29 miles south, has practically suspended operations. This company was employing 125 men. At Ely and Virginia City the workers returned without wage increases and it is the opinion that this will also be the case in Tonopah and Divide, as the principal operators have stated that they are determined not to accede to the wage demands of the miners. The miners have appointed a new committee as suggested by the governor and, while the radical element is interfering with the work of this committee in attempting to reach a settlement, it is believed the governor has the situation well in hand and that the trouble will end within 10 days.

TOKOP.—The Mount Vernon Mining & Milling Co., operating under bond and lease a large group of claims owned by the Le Champ-D'or French Gold Mining Co., Ltd., at Tokop, 30 miles south of Goldfield and 9 miles south-east of Hornsilver, is sinking a shaft to develop water for a mill. The Mount Vernon is a Nevada corporation. The Le Champ-D'or, a French company with offices in Paris and London, is also the owner of the Orleans at Hornsilver and is the former owner of the Silver King at that place. The claims at Tokop are reported to have produced from \$20,000 to \$25,000 worth of gold-silver ore of an average grade of from \$15 to \$25 per ton, with some shipments of ore assaying \$50. The entire production was made by lessees from within 75 ft. of the surface, which is the maximum depth to which the claims have been opened. There are numerous tunnels and shafts, the work of lessees, but there has been no systematic development. It is estimated that over 10,000

tons of free-milling ore is in lease dumps and it is the plan of the Mount Vernon company to erect a small mill for the treatment of this while working to gain greater depth. A mill at Tokop treating custom ore, as the Mount Vernon plans to do, would have a large and rich field in the Tule region, the Slate range, Old Camp, near where the Nevada Empress is situated, and other districts.

BONNIE CLARE.—The Clark interests are reported to be seriously considering the erection of a smelter at or near

A RIVER SCENE IN THE YUKON

Bonnie Clare. The construction of such a plant has been rumored for many years, but on this occasion the report has passed the rumor stage and the feasibility of the plan is being investigated by engineers. Ore would be furnished from the deep levels of the Goldfield mines and from the lead-silver mines south of Beatty.

ALASKA AND YUKON

ESTIMATE OF GOLD PRODUCTION FOR THE SEASON.

DAWSON.—It is estimated that the total gold output of the placer camps of the Yukon Territory and of Alaska will be \$5,250,000 to the close of navigation in October.

To this may be added half a million dollars if the districts of Atlin, northern British Columbia, and of Nome, Alaskan coast, are included, each of these sections being given credit for a quarter of a million. Another half a million may be yielded by other scattered camps throughout the north so that it is possible that the aggregate will reach \$6,250,000 for the year 1919. All northern camps are led by the Klondyke, with Dawson as the centre, its season production being placed at \$2,000,000. Second place is taken by the Tanana Valley, as Fairbanks, Tolovana, and the Hot Springs are credited with \$1,500,000 or more. On his return from a tour of the posts controlled by the Northern Commercial Co., Volney Richmond, the company's superintendent, estimates the season's placer gold yield as follows: Dawson, \$2,000,000; Fairbanks, \$800,000; Iditarod, \$750,000; Tolovana, \$700,000; Kuskokwim, \$250,000; Circle, \$225,000; Ruby, \$125,000; Koyukuk, \$100,000; Marshall, \$75,000; Hot Springs, \$60,000; Ophir, \$50,000; Rampart, \$25,000; Chandlar, \$20,000.

BRITISH COLUMBIA

ALICE ARM AND NELSON.—GENERAL NEWS.

The northern mining camps of British Columbia have come prominently to the front in the last few years and now lead all other parts of the Province in the production of metalliferous minerals. In 1913 the Cassiar mining division, which covers the Atlin, Stikine-Liard, Skeena, Nass River, Portland Canal, and Queen Charlotte districts, produced minerals to the value of \$65,772, while last year the value of the mineral production from that division totaled \$9,178,441. Of course, the Granby company's Hidden Creek mines were mainly responsible for this increase, an increase which is made more remarkable by the fact that for four and a quarter out of the five years that it was taking place the country was at war and there was considerable difficulty in getting labor. The Anyox smelter was blown-in in March 1914, and up to the end of last year it had smelted 3,334,446 tons of ore and had produced in round numbers 142,047,400 lb. of copper, 1,333,700 oz. of silver, and 50,000 oz. of gold. Other parts of the division have done well, and considerable activity is being exhibited at both Alice Arm and Portland canal. Owing to the impossible state of the trails, ore cannot be hauled from the Salmon River mines except over the snow during the winter, and for that reason the returns from the Premier mine did not get into last year's report. This mine alone is said to have shipped during last winter some 500 tons of ore, averaging in the neighborhood of \$350 per ton, and, from accounts that are being received from the district, the output during the coming winter will be so sensational that it will be likely to precipitate a rush to that part of the Province next spring.

ALICE ARM.—Considerable activity in mining is being shown at Alice Arm. R. Besner and associates have struck a 40-ft. face of ore, assaying 130 to 300 oz. per ton in silver, on the Climax claim. Rich silver ore has been developed in the North Star mine by James Mc-

Aleenman and D. Zarilli. The Sweetwater claim, near the Dolly Varden, has been purchased by David J. Hancock, who recently purchased the group of claims owned by the United Metals Co. From the Joplin and Silver Star claims Mr. Hancock is turning out ore running 380 oz. silver, \$13 gold per ton, and 65% lead. Nearly 200 tons of this material is sacked ready for shipment. The La Rose mine is taking out some rich silver ore. Two shipments have been made, one going to Trail and the other to Anyox. The Taylor Mining Co. will erect a 3000-ton ore-pocket on the wharf at Alice Arm. Since the Taylor company took over the Dolly Varden 150 tons of ore per day is being shipped.

On his return from a recent tour of northern British Columbia, in the course of which he visited Alice Arm, Anyox, and other mining centres, Dr. King, Minister of Public Works, stated that he noted a marked increase in mining activity and that a spirit of optimism was apparent which had been lacking in recent years. He inspected the Dolly Varden mines and railroad operating between tidewater at Alice Arm and the mines, a distance of 18 miles, construction of which was authorized by the Provincial Government. Dr. King states that it is the intention of the Taylor Engineering Co. to extend the road for four miles next year, thus affording transportation facilities to other properties now being developed and which are making excellent showings. There is promise of a large tonnage being offered the railroad and the management is anxious to handle as much as possible, not only that the mineral deposits of the country may be made to yield, but that the railroad may be made to pay running expenses. Shipments from the Dolly Varden are expected to continue as long as the weather permits. Under Majors Young and Davis, both mining men recently returned from overseas, splendid progress has been made at the mine. A steam compressor and a 2000-ft. aerial tramway are in operation and the whole property now is as fully equipped mechanically as the difficulty in obtaining machinery would permit. It was necessary to complete the railroad and the aerial tramway before opening the mine to any extent. Discussing conditions in the Alice Arm district, Mr. Taylor, manager of the Taylor Mining Co., which owns the Dolly Varden mine, said that more engineers and prospectors had gone into the country than during any five years preceding.

NELSON.—There is considerable activity at the Eureka mine, Eagle Creek. W. M. Myers, the superintendent, is surveying preparatory to the installation of a new aerial tramway from the upper terminal of the Granite-Poorman tramway to the lower adit of the Eureka workings, which will be about 3000 ft. in length. The Granite-Poorman mine tramway, running between the mill and Granite Siding, a distance of 3000 ft., is being dismantled and the material will be put in the new line. The tramway being removed was utilized originally to facilitate shipment to the smelter. The Granite mill is running steadily on two shifts, handling ore from the upper levels of the Eureka. A cross-cut is being driven on the latter

property which will give 450 ft. depth on the vein. There have been a number of visitors to the Eureka from Walla Walla, Washington, recently, among whom were Mr. and Mrs. C. E. Nye, the former being the president of the Inland Mining Co., which is responsible for the work outlined. Reports reaching Nelson are to the effect that work is proceeding on the Lucky Boy and the Security mines of the Erie district which, together with the Second Relief Property, suffered by fire on July 16. S. L. Myers, superintendent of the two former properties, is engaged in getting out timber for a new bunkhouse and for other buildings. In the meantime Mr. Myers is camping in the tunnel of the Lucky Boy.

GRAND FORKS.—The Consolidated Mining & Smelting Co. is installing three decrepitating furnaces and rotary kilns at the Rock Candy fluor spar mine near Lynch Creek. Since the completion of the concentrator at the property early this year experiments have been in progress as to the proper method of treatment, and it is said that A. A. Roberston, who is superintendent in charge, has met with success with the decrepitating process, something new for this Province. Generally speaking this consists of breaking the fluor spar by means of a decrepitating furnace and rotary kiln, crude oil being used as fuel. One unit of the process was first installed and the results being satisfactory it was decided to install three more. When these are operating it is expected that the plant will handle about 100 tons daily. The demand for fluorite is said to assure the continuous operation of the mine and plant.

MANITOBA

COPPER LAKE.—J. P. Gordon, owner of the gold property recently discovered at Copper Lake, Manitoba, which created much excitement in mining circles and attracted many gold seekers from the Northern Ontario camps, has arrived at Winnipeg, bringing samples and additional details of the find. The vein has now been exposed continuously for 900 ft. It is about 10 in. across on the surface and 18 in. wide at a depth of 6 ft. For some distance along the foot-wall a layer has been found 4 in. wide at the top and 6 in. at the bottom of the pit, from which specimens of exceptional richness were taken. Another property owned by Mr. Gordon in the same neighborhood consists of a large silicious sheer zone, averaging 20 ft. in width, which has been traced with fair continuity for two miles and is stated to give assays of \$9 per ton. Mr. Gordon holds 14 claims covering these orebodies.

ONTARIO

STRIKES AT COBALT AND KIRKLAND LAKE SETTLED.—
PORCUPINE AND LARDER LAKE ACTIVE.

COBALT.—The miners' strike, which has been in progress for about seven weeks, has been settled and the men are returning to work. At a mass meeting held on September 7 the men, after a heated discussion, decided to accept the terms offered by the mine managers. These

comprised an increase of 50 cents per day in the base wage scale, the bonus to be on the price of silver over 80c. per oz. instead of 60c. as formerly. This ensures the men against the consequences of a heavy drop in the price of the metal. Provision is also made for a form of collective bargaining by committees chosen by the men independent of the union. The mine managers state that there will be no discrimination against strike leaders and that positions are open for all. It is stated that in most cases the mines are in good shape and that operations can be immediately resumed. The settlement also includes the men at Kirkland Lake, who have been out for nearly three months, but whether there will be a general resumption of work there remains to be seen, as by far the greater proportion of the miners have left the camp and many of the mine owners professed indifference regarding re-opening until they see an opportunity to reduce overhead expenses.

PORCUPINE.—The upward movement of Dome Extension stock combined with the character of the development work carried on by the Dome Mines at the Dome Extension, are believed to indicate the taking over of the latter property by the Dome under its option which expires in March next. It is noted that the work being done on the Extension is not merely exploratory but includes preparation for actual production. The terms on which the option is held are on a basis of 30 shares of Dome Extension for 1 share of Dome Mines, and the extensive buying of Dome Extension shares is taken as indicating that those having inside information as to the probable closing of the deal are taking this means of securing shares in the Dome at considerably below the market price. The McIntyre is developing an orebody on No. 5 vein at the 1100-ft. level over 800 ft. long and 30 ft. in width, the gold content of which runs higher than those of the ore now being milled, which yields about \$11 per ton. The main shaft is now down 1400 ft. and stations are being cut at the 1250 and 1375-ft. levels where lateral work will shortly be started. The McIntyre mill is treating 40 tons per day of ore from the 100 and 200-ft. levels of the Plenaurum property. The Clifton, on which work was started only a few weeks ago, has a considerable quantity of ore blocked out.

MATACHEWAN.—A second shaft is being sunk on the Otisse property of the Matachewan Gold Mines Co. at a distance of about 1000 ft. from the original workings and along the strike of ore deposition. Lateral operations are being conducted on the 170-ft. level from the first shaft. The company is stated to have acquired an adjacent property previously controlled by R. Norrington of the Allied Gold Mines. A. G. Burrows of the geological staff of the Ontario Bureau of Mines is making an examination of the Matachewan area.

LARDER LAKE.—There has lately been a marked revival of interest in this area, where more actual mining has been done in the past six months than during its previous history. For many years this district was under a cloud owing to the operations of unscrupulous promoters, who swindled many thousands of investors by

booming undeveloped and probably worthless prospects, and many claims of the large number staked in the early days of the rush were allowed to lapse. The operations of the Associated Gold Fields, which is opening up large bodies of low-grade ore on an extensive scale and is preparing to erect the largest mill in northern Ontario, have directed attention to the camp and several hundred claims have been staked since the spring.

MEXICO

PRODUCTION FROM SONORA.—YAQUIS AGAIN ACTIVE.

SONORA.—In spite of washouts and floods creating soft trackage which prevented movement of trains on the Nacozari railroad for several days during August, the

NACOZARI, SONORA, FROM THE MOCTEZUMA MILL

shipment of ore from Sonora properties during the month held well toward the average. The report of the collector of customs in Agua Prieta for the fiscal month shows 232 cars totaling 9178 tons crossed during this period, with the estimated value of \$1,611,700 gold. As usual, the Moctezuma Copper Co. and other properties in the vicinity of Nacozari had the lion's share, shipping 219 cars or 8792 tons. El Tigre shipped eight cars or 272 tons. Shipments from the other properties were as follows: Las Chispas, 21 tons; San Nicolas, 36 tons; Nueva Potosi, 23 tons; San Pablo, 14 tons; and San Pedro, 20 tons.

Mine operations in the Moctezuma and the southern end of the Arizpe mining districts were complicated during the latter part of the month by the depredations of a band of Yaqui Indians that looted the camp of the San Nicolas company and did some damage at the Archipelago, both not far from Cumpas. Leo G. Cloud, managing director for the San Nicolas company, which is operated by a Douglas corporation, brought to Douglas the first authentic account of the looting of the property. Two Indians, so fair that they resembled white men, led the party, which consisted of 80 men. The leaders were said by Mexicans to be Moro Indians. One of them spoke excellent English and acted as interpreter during the stay in the camp, and it was due to his reasonable attitude that the individuals assembled at the property escaped so lightly. The Indians entered the camp silently at 9 o'clock in the morning, although one member of

the band carried a drum improvised from rawhide stretched over a framework of wood. Forming in line before the store kept by Mrs. Carl Knudson, wife of the mining superintendent, the Indians divided into squads and soon had all the employees of the mine and mill gathered at the store, which was then systematically looted, all clothing, cloth, and provisions being brought outside and made into bundles of proper weight for individual transportation. But for the coolness of Mrs. Knudson the camp would have been left hungry when the Indians departed. She suggested to the Indians that it would be unfair to take all the food and leave so many people starving. The Chief at once ordered two large sacks of flour and a small quantity of other goods returned. Mr. Knudson, emboldened by the success of this request, then asked whether the Indians could see any use in holding the property idle during their stay. The Chief told him to select the men he wished to return to work. In a few moments eight men, a sufficient number to operate the mill, were back. The mill run was halted only about 15 minutes altogether. In contrast to the consideration shown the Americans was the manner in which the Mexicans were stripped of all property. Even the most trivial personal belongings were taken from the homes of the Mexican workers, though not an American's belongings were touched. A considerable quantity of stuff belonging to Mexicans which could not be carried away was so damaged as to be rendered unfit for use. From the San Nicolas the Indians turned southward, going by way of the Archipelago mine, which is idle at the present time. The watchman was not molested, but all assaying and office equipment of the company was wantonly destroyed. With the exception of the two leaders, all the Indians were Yaquis of the broncho or wild

THE MILL OF THE MOCTEZUMA COPPER CO.

type. All were ragged and many wore no clothing above the waist line. They were reported to have visited Las Chispas and Babicanora mines near Arizpe, but this was denied by Mr. Cloud. Las Chispas was looted last December, however, by Yaquis and Mexicans, several thousand pesos in money and a large quantity of provisions and supplies being stolen at that time. The quietness of the Yaquis appears to have ended with the rainy season. Mexican federal troops in the Yaqui valley and scattered throughout the district infested are said to be inadequate for protection.

SUSPENSION OF ASSESSMENT WORK

With further reference to the law suspending the requirement for annual assessment work during 1919, it should be noted that oil placer claimants that were not previously granted relief from assessment work are granted relief under the present Act.

Certain difficulties have been experienced in the interpretation of the Act, especially in regard to the provision limiting relief from assessment work to five claims owned by any one person or corporation. In order to avoid confusion and decisions that might be unfair to individuals, an amendment has been introduced before the House to eliminate this provision. If this amendment is passed the suspension will apply to any number of claims. Under the same amendment Alaska is to be included in the territory covered by the Act. The passage of this amendment will be noted in these columns as soon as it has occurred.

COPPER PRODUCTION INCREASING

August production of some of the larger copper companies is reported as follows: Utah Copper, 8,640,000 lb.; Ray Consolidated, 3,805,000 lb.; Chino Copper, 3,321,857 lb.; Phelps Dodge, 12,600,000 lb.; Anaconda, 10,572,000 lb. The two last show a pronounced gain over the July figures, when Phelps Dodge produced 11,122,000 lb. and Anaconda was credited with 9,755,000 pounds.

CALIFORNIA

Alturas.—Lester Reynolds has acquired the High Grade group, in northern Modoc county, and started comprehensive work. Pumps have been installed and machine-drills placed in commission. Supplies are being stored for winter and operations will be continued steadily.

Auburn.—The Parker chrome mine on the Auburn-Grass Valley highway, eight miles from Auburn, has been reopened by J. W. Swanton of Santa Cruz. It is reported \$100,000 will be expended on new equipment and development. The mine is located on the ranch of Ivan H. Parker and produced much ore during the War.

Forest Hill.—Ex-Sheriff George McAulay and associates of Auburn have formed a company to operate the Excelsior gravel property in this district.

Grass Valley.—The Union Hill hoisting and pumping plant has been erected at the old main shaft of the Idaho-Maryland group and dewatering of the workings is to commence within two weeks. The five claims composing the Union Hill group, together with all equipment, has formally passed to the Idaho-Maryland Mines Co. and the deed of conveyance placed on record.

Keswick.—The Little Nellie mine between Keswick and Iron Mountain is gradually changing from a gold mine to a copper mine. A drift was driven west 4000 ft.; at the end a shaft 500 ft. deep is to be sunk. Extensive diamond-drilling is reputed to have shown considerable copper ore. The mine is the property of the Pittsburgh and Shasta Gold Mining Company.

Nevada County.—The Narambagua is now drained and all the levels cleaned out. The main shaft is 1134 ft. deep

and a new station will be cut at the 1100-ft. level. The erection of a 20-stamp mill will commence at once and a new compressor has been ordered. Thirty men are employed under the superintendency of C. T. Green.—The Idaho-Maryland Mines Co. has erected a temporary hoisting frame and transformers are already on the ground and about ready for the wires.

Weaverville.—Work is being started in the Globe mine near Dedrick, after a shut-down of several months. A. B. Cousin of Nevada is in charge as foreman.

COLORADO

Telluride.—The principal operations in the district are development and construction, much of which is nearing completion. The Tomboy mill is expected to be completed within a few weeks. The Smuggler Union Mining Co. has completed the three-story addition to its bunk-house, and the apartment house is nearing completion. The apartment house is to be a model of its kind, fitted with hot and cold water, electric lights, electric ranges, steam heat, and comfortably furnished. There are 64 apartments of four rooms each. The construction work on the Smuggler Union mill is progressing and should be completed on schedule time. There is still a shortage of labor, which is hindering development work at the mines. It is estimated that about 400 more men, skilled and unskilled, are required to carry out developments planned. Interest in the mines in the vicinity of Ophir is being revived, and there is marked activity in this district. The San Bernardo mine is now under lease to the Valley View Mining Co., of which Otto Beselack is the local manager, and a 100-ton mill is being planned. The San Bernardo carries good bodies of ore, running high in silver, and there is no doubt that the property can be developed into a profitable producer. The Carribeau Trust has resumed shipping, two small shipments, one of ore and one of concentrates, being shipped during the latter part of August. The Belmont-Wagner Mining Co. is shipping steadily from the Alta, but not producing as heavy a tonnage of concentrates as anticipated, partly due to a shortage of miners. John M. Wagner continues to ship steadily from the Cimarron a concentrate carrying high gold.

MICHIGAN

Houghton.—Mohawk is improving its ore tonnage slightly in September and there is a small betterment in the copper contents also at present, so that the output of refined copper for September may reach a better figure than in the past six months. Mohawk mined, in August, 43,200 tons of copper rock. This is practically the same tonnage as was broken down and sent to the mill in July.—Wolverine is continuing to increase its ore tonnage. The actual output for August was 27,500 tons, an increase of 3500 tons over the record for July.—Michigan sent 5885 tons of ore to the mill in August, an increase from 4715 tons for July.

The Champion mine continues to produce at a satisfactory rate. Its output is greater than the Baltic and Trimountain combined. The combined ore output of the Copper Range producing mines for August was 79,000 tons, an increase of 8000 tons over July. Of this total the Champion produced

45,000, Baltic 20,000, and Trimountain 14,000 tons. Both the Champion and the Baltic show the best increases. In July the Champion produced 38,000 tons and the Baltic 18,700.

Seneca shaft is still being sunk. It is in the foot-wall. There is, approximately, 65 ft. more to go before it passes the curve. The third level will not cut the lode in the shaft proper, but will be planned to strike it from the cross-cut. If the lode has not been faulted the cross-cut distance will be 60 ft. for this level. No lateral work is being done on the second level at this time and none will be done until the shaft reaches the third level. When that level is cut there will be a raise to provide facilities for more economical and more efficient development of the orebody at both points of depth. The first level continues to show promising Kearsarge amygdaloid. A total of 325 ft. has been opened in the lode, both sides from the shaft. The north side has been continuous in good copper-bearing rock from the start. The south side ran into a fault, which is one of the characteristics of the Kearsarge lode. That necessitated a little exploration but recently the miners found the promising ground again. This first level rock is being stockpiled and will be milled in the near future, not as a mill test, but simply to prevent accumulation of rock. As soon as a couple of thousand tons is accumulated, enough to keep one stamp-head busy for a couple of shifts, a clean-up will be made. Nothing definite has been determined as to the location of the proposed Seneca milling plant, but three sites are under consideration.

Winona now has two shafts operating, although the complement of men is not yet up to its requirements. One hundred men are employed underground.—Victoria produced 130,000 lb. of concentrate in August, which was not up to the usual showing. The underground openings from the 20th to the 27th levels are in normal ore.

IDAHO

Salmon City.—The new mill of the Pope-Shenon mine is expected to make its first run about October 15. According to A. Boulais, superintendent of the mine, the first unit will have a daily capacity of 50 tons, and as conditions warrant other units will be added to meet the plant's crushing capacity of 200 tons. Mr. Boulais says the mine has a large tonnage of copper ore that will average about 5%, and the ore of shipping grade, which is now being mined at the rate of about two cars per week, will run as high as 15%. The company has erected a boarding-house and is now well equipped to handle a large force of men and to conduct operations the year round. At present a force of 35 men is employed at the property.

NEVADA

Austin.—Following discoveries of high-grade gold ore in the Birch Creek district, 10 miles east of Austin, a new town has been established with the name of Telluride. The ore occurs in rhyolite with a lime foot-wall and monzonite hanging. The discovery was made by Jack Cahill, veteran prospector who discovered the property of the Round Mountain company at Round Mountain, and other noted Nevada producers. The vein has been opened for 100 ft. on surface and cross-cut by a 45-ft. tunnel. The entire lode is said to pan gold with veinlets sampling \$8000 to \$51,000. Scores of claims have been located around the original discovery and a rush is on from Austin, Tonopah, and Goldfield. Austin is the nearest supply point.

Cherry Creek.—Exploration Syndicate No. 2, of New York, has purchased the Exchequer mine from the Exchequer Mining & Leasing Co. and increased its operations. The deal gives the syndicate control of most of the leading properties in the Cherry Creek district. Silver is the principal metal produced. J. W. Walker is manager.

Goldfield.—Goldfield Development Co. has purchased the cyanide equipment of the Aurora Mines Co., formerly operating the Aurora Consolidated at Aurora, and is adding the equipment to the Consolidated mill. Machinery includes classifiers, thickeners, and filters. Besides supplying the mill with water from the Grizzly Bear shaft the company has arranged to receive water from the Silver Pick mine. Ore-bins at the Development shaft have been completed and two more electric locomotives purchased for underground haulage. Four of these locomotives will soon be in operation.—The Atlanta company is completing arrangements for extensive work from the 1400-ft. level of the Grizzly Bear shaft of the Goldfield Development. The work is in charge of A. H. Lawry, general superintendent for the Goldfield Consolidated, and is designed to develop a large area of promising ground.—Red Hills Florence is driving two east cross-cuts, one west cross-cut, and two south drifts from the 500-ft. level of its lease on the Florence Goldfield. The main south-east drift is out 400 ft. from the shaft.—The Florence Divide lease has opened a high-grade shoot paralleling the main vein on the 400-ft. level of the Florence Goldfield. The richer ore is being stored in the John S. Cook bank for shipment by express.—J. B. Kendall, president for the Consolidated Mayflower Mines Co., at Pioneer, has taken a lease on a block on the Cornishman shaft of the Florence Goldfield, 200 ft. north of the Daisy shaft. Cross-cutting has started from the seventh level on a seam assaying \$30. It is planned to intersect a shoot from the Jumbo vein at its junction with the Consolidated-Florence vein-system.

Jungo.—Mandalay Mines Co. is installing a hoist, compressor, and machine drills at its property in the Antelope range. Sinking the shaft on the True Vein claim to a depth of 200 ft. is to start immediately. The main vein contains silver and gold. J. F. Dwyer is manager.

Loring.—The Malley shaft on the Nevada Honey Bee is down 110 ft. Cross-cutting will begin at the 200-ft. level, which is expected to be under the schist surface formation. The tunnel is in 225 ft. A good plant, including four-drill compressor and 16-hp. hoist, has been installed. The first shipment from mine assayed \$34 per ton. The company has a treasury fund of \$250,000 cash. J. H. Bell is superintendent.—The East vein on the Loring Treasure Hill group has been traced for 1500 ft., and in a high-grade streak on the foot-wall ore showing visible gold is found in every opening. The first shipment ran \$69 per ton, and there are several hundred tons on dumps that will mill over \$10. James Garnier is superintendent.—Mr. Beauchamp, manager for the Jose-Davis company, has opened up an ore-shoot on the Shepherd 100 ft. long and 60 ft. deep, and has 200 tons developed that he estimates averages \$200 per ton. A 30-ton mill has been ordered and is now on the road. Nearly all the veins in Loring carry gold, with small quantities of silver, but several carry silver and copper, with but little gold.

Tuscarora.—Following the discovery of rich silver-gold 'float' the Rose Mining Co. has increased its underground force and started prospecting for the source of the rich ore. In the main tunnel excellent ore has been opened and the management plans to erect a mill in the early part of 1920. F. L. Reeber, of Winnemucca, is manager.

UTAH

Milford.—Machinery has been moved from the old shaft of the Utah-United and installed at the shaft of the Beaver Lake Copper on the property of the Beaver Copper Co., according to word recently sent by A. J. McMullen, manager for the company, to the local offices. The shaft, 460 ft. in depth, will be speedily put into shape for operations. With the completion of this work, a drift will be started to cut the ore.

Park City.—Shipments from the Park City district continue to increase. For week ending September 12 4,140,000 lb., as compared with 3,713,480 lb. for the preceding week, was shipped from the district. From now on shipments from the Silver King Consolidated mine are expected to make a steady increase as a result of the recent discovery in the Electric Light claim. At the Ontario, which is the heaviest shipper of the district, considerable work is being done. The following gives the shipments, in pounds, made during the week:

| | Pounds |
|-------------------------------|-----------|
| Ontario Silver | 1,507,400 |
| Judge Mining & Smelting..... | 1,116,510 |
| Silver King Coalition | 1,085,600 |
| Daly West..... | 326,560 |
| Silver King Consolidated..... | 110,000 |

Total 4,140,000

Tintic.—Ore shipments from Tintic during the week ending September 12 reached a total of 117 cars compared with 129 cars the week before. The shippers follow:

| | Cars |
|---------------------------|------|
| Chief Consolidated | 34 |
| Dragon Consolidated | 19 |
| Tintic Standard | 14 |
| Iron Blossom | 12 |
| Colorado | 8 |
| Eagle & Blue Bell..... | 7 |
| Mammoth | 7 |
| Centennial Eureka | 3 |
| Victoria | 2 |
| Gemini | 2 |
| Ridge & Valley | 2 |
| Empire Mines | 2 |
| Oasis | 2 |
| Swansea | 2 |
| Alaska | 1 |

Total 117

Theodore Nichols, who for a number of years has been interested in the North Tintic district, is in charge of the development campaign which a short time ago was taken up on the property of the Tintic Empire company. This property lies between the Lehi-Tintic and the Tintic Paymaster and is regarded as a promising piece of mineral ground. Carpenters are now busy erecting buildings and the work of sinking a double compartment shaft was started last week. Officials of the Plutus company have reported a good showing in the face of the drift which they are driving from the bottom of the 1000-ft. winze, the point at which the work is being carried on being 1400 ft. from the surface. It will be recalled that the Plutus got into small bunches of ore on the 1000-ft. level and that a winze was sunk into the ore-bearing limestone before driving was started. It was only a few days ago that sinking was stopped in the winze and driving started.

WASHINGTON

Ferry County.—In Keller the mining situation just now is encouraging. New York capital is reported to be seeking copper investments.—R. Shoemaker, of Jacksonville, Illinois, has succeeded the late J. C. Davis in the management of the mines owned by the Illinois Mining Co. It is intimated that during the present year development will be confined to one mine and that the others will remain idle for the present.

BRITISH COLUMBIA

The Consolidated Mining & Smelting Co. of Canada has declared a dividend of 2½% for the quarter ending September 30, payable October 1 to shareholders of record at the close of business on September 10.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

J. E. Clennel is in London.

J. P. Gordon is at Winnipeg.

F. F. Sharpless is in Tennessee.

Fred. W. Foote has gone to Cuba.

L. D. Ricketts is in San Francisco.

Courtenay De Kalb is at Rio Tinto.

Pope Yeatman is at Salt Lake City.

Olof Wenstrom is in San Francisco.

F. G. Cottrell has returned from France.

Gilmour E. Brown has left San Francisco.

S. Matsubara has left Butte for Mullan, Idaho.

James S. Douglas was in San Francisco last week.

Charles A. Chase has been at Silverton, Colorado.

Seeley W. Mudd was in San Francisco during the week.

J. W. Richards is visiting electro-chemical plants in Norway.

W. H. Emmons 2nd was in New York last week and has gone to Washington.

G. L. Sheldon, formerly of Ely, Nevada, was in New Mexico during August.

C. L. Colburn has been visiting Breckenridge, Leadville, Cripple Creek, and Denver recently.

A. B. Shotts has become general manager for the American Ores & Asbestos Co., Globe, Arizona.

A. I. D'Arcy, vice-president and general manager for the Goldfield Development Co., is in New York.

Robert S. Lewis, professor of mining at the University of Utah, was a visitor in San Francisco last week.

Leonard W. Orynski, Lieutenant in the Engineer Reserve Corps, has returned to San Francisco from France.

Carl Zapffe, geologist for the Northern Pacific Railway Co., has returned to Brainerd, Minnesota, after one month's absence.

William Robertson, smelter manager for the Broken Hill Associated Smelters, is visiting metallurgical plants in the United States.

George Crerar has returned to San Francisco after an absence of eight months in Mexico. He may be reached at 520 Crocker building.

A. H. Lawry, superintendent for the Goldfield Consolidated, has succeeded A. I. D'Arcy as manager for the Wingfield companies at Goldfield.

W. Lorraine Cook, formerly manager for various mining companies in Mexico and South America, is now general manager for the Silverman Mines Co., a silver, lead, and copper mine in Hinsdale county, Colorado.

Warren C. Prosser, who has been superintendent for the Red Mountain Mines Co. at Ouray for the past two years, has resigned to return to professional work in mineral and oil-land investigations, with headquarters at Denver.

Frederick Lyon has resigned his position as vice-president of the U. S. Smelting, Refining & Mining Co. He will take a trip to Europe for the benefit of his health. He was the first general manager for the Mammoth Copper Co., and in 1904 broke ground for the smelter.

Henry B. Underhill, president of the Selby Smelting & Lead Co., died at his residence in San Francisco on September 14. A more extended notice will follow later.

THE METAL MARKET

METAL PRICES

San Francisco, September 16

| | |
|--|-----------|
| Aluminum-dust, cents per pound..... | 60 |
| Antimony, cents per pound..... | 9.50 |
| Copper, electrolytic, cents per pound..... | 24.00 |
| Lead, pig, cents per pound..... | 6.50-7.50 |
| Platinum, pure, per ounce..... | \$120 |
| Platinum, 10% iridium, per ounce..... | \$140 |
| Quicksilver, per flask of 75 lb..... | \$105 |
| Spelter, cents per pound..... | 9.00 |

EASTERN METAL MARKET

(By wire from New York)

Sept. 16.—Copper is quiet and easy. Lead is stronger and higher. Zinc is inactive and lower.

SILVER

Below are given official or ticker quotations, in cents per ounce of silver 999 fine. From April 23, 1918, the United States government paid \$1 per ounce for all silver purchased by it, fixing a maximum of \$1.01½ on August 15, 1918, and will continue to pay \$1 until the quantity specified under the Act is purchased, probably extending over several years. On May 5, 1919, all restrictions on the metal were removed, resulting in fluctuations. During the restricted period, the British government fixed the maximum price five times, the last being on March 25, 1919, on account of the low rate of sterling exchange, but removed all restrictions on May 10. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the normal rate of exchange.

FOREIGN EXCHANGE

Depression continues in the foreign exchanges. Both francs and lire scored absolute new lows, and sterling broke badly. Today's quotation of 4.14% is only 2½c. above the record low. A postponed steamer sailing that caused a hold-over of bills is held partly to blame, but the main trouble lies deeper—the imperative need of credit arrangement. The German mark has shrunk further to 3.5c. and the Vienna mark to two cents, or discounts of 86% and 92%, respectively, from normal parity.

Apart from such general exchange operations is the special provision being negotiated in the case of Belgium, the first European nation to receive acceptance assistance here, through the medium of a proposed additional \$50,000,000 loan, this time in the shape of 10-year bonds as proposed or else 25 years as desired. Meanwhile an additional credit item in favor of Belgium is reported in the matter of \$20,000,000 of locomotives said to be under negotiation, with payments suggested in five-year dollar notes. A. B. Leach & Co., Inc., are offering Belgian government bonds of 5% national restoration loan of 1919. It is pointed out that due to the exchange situation these bonds can be purchased for about \$125 per 1000 francs par value. At normal rates of exchange the value would be \$193. Interest return on 1000 francs at present rates is about \$6.25 and in case of return to normal rates would be over \$9.50.

A ten million dollar shipbuilding order for French interests has been lost owing to the extreme weakness in francs and the inability of the purchasers to pay in dollars. The inquiry was in the hands of an American shipbuilding concern and could have been booked had it been willing to accept letters of credit in francs. The proposed sale by the United States Shipping Board of a number of its Lake-lock type of vessels to France, which would have involved close to \$100,000,000, has also been delayed by reason of the unsettlement in foreign exchange.

Although reports are being repeatedly made that Germany has or is about to secure credit in the Eastern market, it is hardly probable that she will be accommodated for some time to come, at least not until bankers have had time to make a thorough investigation of conditions in that country. The same applies to some other central European countries, such as Poland, Austria, and Jugoslavia. An officer of a prominent bank says his institution is being approached almost daily by various German interests with a request for credits, but in every case application is refused. The bank has three representatives in central European countries studying the situation there, and, until they have reported their findings, the bank is not likely to entertain any proposition from those nations for a long-term credit. It is learned, however, that New York banks are assisting German importers individually with exchanges of credits at a certain rate of exchange. Dollars are advanced here against marks placed to the bank's account in German centres. Selling of these marks is largely responsible for the weakness which the currency has recently shown in the Eastern market.

Bankers place no credence in the report that the German government is attaching American remittances drawn against balances opened since commercial relations have been resumed. They are buying and selling exchange on Germany, and funds are being transferred by their correspondents in the usual way. It appears, however, that the old balances, carried at time of our entry into the War, are still sequestered by the German government, which will probably not release them until peace is definitely established.

Quotations on September 16 are as follows:

| | | |
|-----------|--------|-------|
| Sterling: | Cable | 4.14% |
| | Demand | 4.14 |
| Francs: | Cable | 9.10 |
| | Demand | 9.11 |
| Lire: | Demand | 10.00 |
| Marks | | 3.50 |

Eastern Metal Market

New York, September 10.

All the markets have been unusually dull the past week and prices have been easy to firm.

Copper needs have been light and have been met by metal from second hands at levels below those of the large producers.

The tin market has been exceedingly quiet, but spot metal is scarcer and higher.

Demand for lead is better and the outside and Trust markets are very close together.

Prices for zinc have again eased off on very light demand and offerings from dealers and small producers.

The antimony market is unchanged.

IRON AND STEEL

The trade is not taking very seriously the conference of union officials in Washington, and while talk of a steel strike is a disturbing factor, operations at mills and selling activities are proceeding as usual. Leading sheet mills are operating at 95% capacity with tin plate a little better. The steel ingot production for August was at the high rate of 121,036 tons per day which corresponds to an annual output of 37,392,000 tons. The August production was the best this year except January. Late sales for export total 45,000 to 50,000 tons and for railroad car repairs 20,000 tons. One Chicago plate mill has sold most of its 1919 output.

COPPER

Conditions have not changed materially in the last week. What demand there is is small and seems to be easily satisfied by dealers and small producers. To meet this demand electrolytic copper has changed hands at from 22.25 to 22.75c., New York, for early delivery, with Lake copper about 1c. above these levels. Producers generally, however, are still firm in their quotations of 23.50c. for September and 24c. for October and last quarter for electrolytic, with Lake at 24 and 24.50c. respectively. They are taking very little business and are apparently well sold up for September and for part of October. They are confident of a revival of buying a little later for delivery over the remainder of the year. We therefore quote the market at 22.50c., New York, for electrolytic for early delivery, with Lake more or less nominal at 23c., New York. The outside market is firm today with less metal available from second hands, on a firmer attitude manifest by these sellers. It has been rumored that large producers have been selling surplus metal through second hands, but this has been doubted strongly.

TIN

The market has been a quiet one the past week and there have been no interesting features. Spot tin, both Straits and other grades, has been and is scarce and as a result prices have advanced until yesterday spot Straits was quoted at 56.50c., New York. It appears that the heavy arrivals in August have been absorbed and also that shipping conditions in England are extremely bad, it being difficult to get a shipment off even after it has been loaded. The uncertainty as to a possible steel strike has also caused a slowing down in demand. Buyers have been showing some interest in prices for both prompt and future delivery, but it seems that they have not had the nerve to make purchases. This is another explanation of the slow and drifting market. Tin arrivals in August were 4345 tons, of which 2075 tons came in at Atlantic ports. The quantity in stocks and landing was 920 tons on August 31, with 3590 tons reported

afloat. Quotations yesterday were as follows on future shipment tin: September Straits from England, 54.25c., with September-October shipment at 53c.; English Lamb & Flagg early October shipment from England at 53.25c. Spot Straits tin was quoted yesterday in London at £283 per ton.

LEAD

The market has been quiet with business confined to the outside market, where offerings as low as 5.75c., New York, have been made and absorbed. It is believed that these have been pretty well cleaned up. At any rate the market is firmer today at 5.90c., New York, or 5.75c., St. Louis, with the trust price unchanged at 6c., New York, or 5.75c., St. Louis. Some dealers report a very quiet market while others declare that where one carload has been sold at concessions in New York at least 500 tons has changed hands at an equivalent of 6c., New York.

ZINC

Quotations for prime Western have fallen in the past week largely because of a poor demand and because of offerings by dealers and second hands. These have also been buyers to some extent. For September delivery prime Western is quoted at 7.35 to 7.40c., St. Louis, or 7.70 to 7.75c., New York, with a slight premium for October. Most producers are unwilling to do business at present levels and many of the consumers are not interested. Here again the uncertainty regarding a steel strike has been a deterrent factor. There has also been very little export business because of unfavorable exchange rates and German competition. A fair business has been done this week in special grades.

ANTIMONY

There has been no change. Wholesale lots for early delivery are quoted at 8.62½c., New York, with 5-ton lots at 9.25c., New York, both duty paid.

ALUMINUM

No. 1 virgin metal, 98 to 99% pure, is unchanged at 32 to 35c., New York, for wholesale lots for early delivery.

ORES

Tungsten: The market has been quiet because of the uncertainty regarding the duty question. Quotations in the meantime range from \$7.50 per unit for Chinese ore to \$10 per unit for Bolivian ore, duty to be paid in all cases by the buyer if the tariff measure goes through. There has been no test of the ferro-tungsten market heard of, but prices are believed to be around \$1 to \$1.25 per lb. of contained tungsten.

Molybdenum: There has been very little change in the situation. New inquiry has appeared but it does not seem to have developed into any business. Quotations are nominal at 75c. per unit in 60% concentrates.

Manganese: Imports of manganese ore in July were 15,585 gross tons, bringing the total for the first seven months of this year to 241,570 tons, as against 274,722 tons to August 1, 1918.

Manganese-Iron Alloys: Although several British producers of ferro-manganese were selling the alloy at \$95, seaboard, a week ago, apparently none of them are doing so now. Whether this has been due to the protest of the American producers a week ago to the effect that British makers were dumping in this market, contrary to the anti-dumping law, is not certain.

INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

BUILDING UP A WORN PUMP WITH THE OXY-ACETYLENE PROCESS

*The type of centrifugal pump used by dredging contractors and mining operators for such purposes as dredging silt, sand, mud, and gravel from the bottoms of channels, and for mining soft ore by the hydraulic mining system, is subject to excessive wear due to the constant abrasion of the sand and gravel against the inner walls of the pump chamber. When the wear becomes so great as to interfere with the operation of the pump, or 'sand-sucker', as it is commonly called, it becomes necessary not only to put the pump

vessels. The record for one month for one dredging-pump having a 20-in. outlet pipe was 456,000 cu. yd. of material. At the average unit cost given above, the monthly cost of dredging this amount of material was over \$30,000. The sand-sucker shown in the illustration is much larger than the one referred to above. Furthermore, the cost of materials and labor is much greater today than in 1912. When such factors as loss of profits, overhead expenses, non-productive labor, and contract penalties are taken into consideration, obviously every week of idleness meant a loss of thousands of dollars.

Building up the Abraded Surfaces. 1264 lb. of High-Carbon Steel was Welded on

itself out of commission for repair but also to hold an expensive dredging barge and its crew in idleness.

Such a sand-sucker chamber that had become badly scored through use was recently restored to practically its original condition by the Chicago job welding department of the Oxweld Acetylene Co., by means of the oxy-acetylene process. When it is considered that new castings would have cost about \$3500 and that the actual cost of repairing by welding methods amounted to only one-third as much, it is not surprising that the contractor decided to repair instead of to replace, especially in view of the still more important fact that repairing enabled him to get the dredge back into service with only a few days delay, whereas replacement meant a delay of from 10 to 12 weeks.

In order to gain some idea of the cost of a delay due to the breakdown of a hydraulic dredging outfit, an estimate of the earnings of a dredge will be given. In the year 1912 the U. S. government estimated the cost of hydraulic dredging to be 7.18c. per cu. yd. This figure represented the average total unit cost of operating a fleet of hydraulic dredging-

Steel Casting of Centrifugal Dredging Pump, 14 Feet Outside Diameter

The pump chamber of the sand-sucker illustrated is 14 ft. in outside diameter, and consists of two massive steel castings having a total weight of 7 tons. The abrasion had been so severe it was necessary to re-build both side walls of the pump chamber for a distance of 8 in. from the inner circumference. The thickness of the added metal varied from 1½ to 2½ in. In addition, a new section approximately 14 by 18 inches in area had to be welded into the throat of the casting. The latter was approximately 3½ in. thick.

In order to ensure holding the two halves of the chamber in alignment during preheating and welding they were bolted together and the heavy outer reinforced sections of the castings were not heated, as this would have produced internal strains, either breaking the castings or shearing the

*From Engineering Department, Oxweld Acetylene Co., Chicago, Illinois, and Newark, New Jersey.

bolts that held them together. Preheating by means of charcoal was applied locally for a distance of about 14 in. from the edges of the flanges, each preheat extending for a distance of 3 ft. around the inner circumference.

The total weight of steel added to the castings by welding amounted to 1264 lb. The operators, each using an Oxweld blow-pipe fitted with No. 15 welding head, worked in pairs. As the heat in the small enclosure where the men worked was intense, it was necessary to hold several welders in reserve and to work on the relay plan, each welding shift extending for a period of 20 minutes. Six days were required to complete the building-up work.

As the built-up surface will be subjected to the same abrasive action of sand and gravel, high-carbon steel welding rods were used for the purpose of building up, thereby giving an extremely hard surface, in fact, one that it was impossible to cut with a file, after cooling.

The oxy-acetylene welding work saved the contractor the expense of several weeks of idleness, nearly \$2500 in cash on the cost of the casting alone, and gave him a pump actually improved in construction, because lined with abrasion-resisting steel.

HEAT-TREATED GEARING FOR MINE LOCOMOTIVE

By J. E. Mullen*

Gearing is an important item in the chain of equipment, parts, and supplies, which, when linked together, go far toward making continuous operation of machinery possible, and too much attention cannot be given to this fact. This is true not only for locomotive gearing, where broken gears or pinions result in serious delays to haulage systems, but for all other gearing in and about mining operations.

As far as gearing is concerned, the delays most commonly experienced can be successfully combatted only by using a superior grade of material. Case-hardening was the first step in this direction, and although gearing so treated was better than untreated gearing, it was not the best treatment

his purpose, especially for use on locomotives. These are hardness and toughness, and one is just as important as the other. A gear or pinion with great surface hardness and soft core is unsuitable, because, although capable of giving long service if steady and continual wear were the only considerations, such gearing is unable to withstand breakage due to the many stresses and shocks incidental to mine service. On the other hand, although gearing that is tough will prevent breakage caused by frequent starting and stopping, inexperienced motormen, poor alignment of tracks, and other causes, it will not have the necessary surface hardness to wear well. The ideal is a combination of the two good qualities. This combination the Nuttall company has obtained by perfecting specially heat-treated gearing; in fact the principle of the treatment has been founded solely upon these two qualities. The treatment referred to is well known to many mine operators and is fast becoming their standard—namely Nuttall BP grade when applied to forged steel and NP grade when applied to cast steel.

The following service record shows the benefits derived from the installation of treated gearing. One of the Baldwin-Westinghouse mine locomotives equipped with a 35-hp. motor operating over a 5000-ft. haulage road, with two maximum grades of 2½%, around a 75° curve, full trips hauling up grade, covered 4000 miles per year, hauling 100,000 tons of coal during that time. A BP pinion on this locomotive gave 100% service for a period of five years, and was not entirely worn out when removed; during this time 500,000 tons of coal was hauled under the most severe conditions. In five years ten oil-treated pinions would have been necessary, resulting in ten interruptions of service, and, allowing one-half day for each interruption, would have meant a reduction in output of 3000 tons. A case-hardened pinion broke in 1½ years; it hauled 150,000 tons; but the vital point is that it broke. The teeth wedged in the gear mesh, and locked the wheels, and not only was the locomotive disabled but the haulage road was blocked for two hours, which alone meant a reduction of nearly one-half day in production. It will not be necessary to go into further detail with the mine operator to illustrate the saving in ultimate cost effected by having in service the type of pinion whose performance is first cited.

Typical Heat-Treated Gearing

for mine service because the glass-hard surface with soft core or centre, although resistant to abrasion, did not have the necessary toughness to withstand the severe shocks and stresses to which mine gearing of all descriptions is continually subjected. Consequently extensive research and experimental work was necessary in order to perfect a treatment better adapted to mine conditions.

Two important points must be considered by the mine operator when selecting the type of gearing best suited for

COMMERCIAL PARAGRAPHS

William H. Baker has resigned from the Atlas Portland Cement Co. in order to join the staff of the Hardinge Conical Mill Co. as vice-president.

The McFarlane-Eggers Machinery Co. of Denver has shipped a gasoline locomotive equipped with Ford engines to the Western Zinc Concentrating Co. of Leadville, Colorado.

John Kelly, who for a number of years was New York district manager of the Edison Storage Battery Co., has been appointed general sales manager for the company, with headquarters at Orange, New Jersey.

The Western Machinery Co. of Los Angeles has placed on the market a new Diesel engine, known as the 'Western'. This is manufactured in sizes of 25 b-hp. cylinders in multiples up to four, and operates on low-gravity oils.

The Worthington Pump & Machinery Corp. announces its purchase of the plant, patterns, accounts, patents, and other assets of the Epping-Carpenter Pump Co., at Pittsburgh, Pennsylvania. The plant will be operated as the Epping-Carpenter Works. Orders and contracts now in hand will be completed by the Worthington Pump & Machinery Corp. and all further business will be for its account. Remittances should be made to and all correspondence should be addressed to the Worthington Pump & Machinery Corp., at the Epping-Carpenter Works, No. 10 43rd street, Pittsburgh, Pennsylvania.

The high efficiency and dependability of G-E Synchronous Motors are relied upon in many industries today.

Three 212 h. p.-225 r.m.p. Synchronous Motor-driving Compressors in a railroad shop

88,000 h.p. of synchronous motors supplied in 1918 for air compressor drive

FOR a quarter century the General Electric Company has supplied synchronous motors designed for the particular work to be done. The first ones furnished are still in continuous service requiring maximum dependability.

For industrial drives these motors are furnished from 25 to 2000 h.p. capacity with speeds from 80 to 1800 r.p.m. and are designed to start any load met with in commercial practice without excessive current demands upon the power circuit.

The very high efficiency and dependability of these motors are due to their excellent design which is based on thorough testing of both raw materials and finished motors.

Our engineers will be pleased to supply additional information on these motors.

WATER in Arizona is receiving attention. The Arizona Resources Board, which was organized under an act of the last legislature, is gathering data and will recommend means for developing the water resources of the State. The investigation will cover all phases of the subject, including water power and water development for mines.

ELSEWHERE in this issue we publish an article on the origin of quartz in veins, written by Mr. George J. Bancroft, of Denver, whose experience in mining covers regions widely separated, as the text of the article suggests. We feel assured that many mining engineers, as well as geologists, will find the article stimulating to further inquiry and observation.

HERBERT HOOVER, who has just returned to San Francisco, according to the Manchester 'Guardian' was the nearest approach to a dictator that Europe has had since Napoleon. This was natural. At a time when, to many of those disrupted peoples, food is more important than gold, the key to the granary may easily be an instrument of greater power than the scepter. It will be remembered how the last of the Hapsburgs, recently attempting to erect a new throne amidst the ruins of Austria, stepped hastily down at a short command from the man who directed the distribution of food to the starving people of Eastern Europe. Food is the supreme essential; kings and armies alike collapse when they are hungry; and he that controls the food supply wields the most potent weapon mankind has yet discovered.

SILVER is one of the metals that was brought into unusual prominence by the War, and, like so many commodities of a different type, it fell under Government restrictions as to price and distribution. By agreeing to purchase at \$1 per ounce, the Government prevented the price falling below that figure, at the same time that it fixed a maximum of \$1.01½ and directed to England at this price all the silver we could export. The embargo was removed at the signing of the Armistice, and the other restrictions in last May. The agreement to purchase at \$1 is still in force. There has been some discussion as to the effect of these restrictions. One side contends that the price at which the silver was sold to England was too low, and points to the fact that China at that time was bidding \$1.30 per ounce. The argument is not against the policy of directing the silver to the London market, which was considered a war necessity,

but rather that the price was not properly adjusted. The other side contends that with a free market there would not have been the excessive demand from the Orient, and that the price would have dropped below \$1 per ounce. In other words, the Government maximum of \$1.01½ was designed to give, while directing our silver to the war zone, compensation equal to that which would have been obtained in an unrestricted market. Under 'Discussion' we publish an interesting letter on this subject from Key Pittman, U. S. Senator from Nevada. Senator Pittman was the father of the Pittman Silver Bill, and writes in defence of the Government restrictions. We commend his letter to all who are interested in the status of silver.

THE Government explosives plant 'C', at Nitro, West Virginia, one of those built for the manufacture of smokeless powder during the War, is being offered for sale. An idea of the scale on which explosives were produced may be gathered from the equipment of this single plant. The ground covered is 1800 acres; the improvements consist of 737 manufacturing buildings, and housing accommodations for 20,000 persons. There is a sulphuric acid plant with a capacity of 700 tons per 24 hours; a nitric acid plant with a capacity of 300 tons; a cotton purification plant with a capacity of 225 tons; a power plant of 35,000 hp.; a 400-bed hospital; and the water, sewage, lighting, telephone, and railway systems of a modern city. The Government recommends that capitalists interested in different units of this remarkable plant should associate themselves together and submit a bid on the entire property. We hope that a sale will soon be made, whereby equipment built for highly-organized destruction may be turned to less violent purposes, and in the manufacture of peaceful commodities offset some of the scarcity that is now so troublesome.

AS we go to press, preparations for the steel strike are completed, with both sides stated to be ready for a decisive battle. Reports have already come in of rioting and crowds dispersed forcibly by the Pennsylvania State Police. At a time when all far-sighted men are calling for more production as the only method of combatting the post-War scarcity of commodities and the resultant high cost of living, this strike seems a particularly stubborn piece of foolishness. Called in defiance of the requests of both President Wilson and Samuel Gompers that action be postponed until after the Labor Conference in October, it is not clear how the steel-workers ex-

pect to profit by a trial of strength just at this time. Indeed, as we have been able to sense public opinion. Labor will be fortunate if it does not lose much that it has gained recently. The open-shop is proclaimed as the principal issue, but another can be dimly seen, namely, a challenge to the leadership of Samuel Gompers by John Fitzpatrick, president of the Chicago Federation of Labor and chairman of the steel-workers' committee. Samuel Gompers has proved himself a sane and conservative leader as well as a good patriot, under whose skilful guidance Labor has made many strides in this generation. To ignore his wise council in order to hearken to the less responsible and more radical element can but result in eventual injury to the cause of Labor.

Blast-Furnace v Reverberatory

The relative advantages of blast-furnaces and reverberatories has always been a fruitful subject for discussion among smeltermen. Although each has its advocates, of late years opinion has leaned more toward the reverberatory, a leaning that has undoubtedly been influenced by the development of flotation and the resultant large quantities of fine concentrate to be smelted, and by the economies of coal-dust firing. Faced by the necessity of using the reverberatory for much of their smelting, metallurgists began to consider the possibility of using it for ores that were customarily smelted in the blast-furnace. Recently we have had the pleasure of publishing several articles on this subject, notably from Mr. Oliver E. Jager, describing the practice at Anaconda, from Mr. Walter G. Perkins, an enthusiastic champion of the reverberatory, and from Mr. E. P. Mathewson, who from his wide experience states that the blast-furnace is still able to hold its own. On another page of this issue Mr. C. V. Corless also takes up the cudgels in defence of the blast-furnace, with special reference to the Sudbury Nickel district, the present smelting practice of which he gives in brief outline. Mr. Corless, as manager of the Mond Nickel Company, is well qualified to know whereof he speaks. It will be observed that he mentions the occurrence of pyrrhotite and pyrite as one of the factors influencing a decision in favor of the blast-furnace. This obviously refers to the fuel economies possible with pyritic smelting; yet we would suggest that in many ores a high sulphur content has no such value, and is therefore not a decisive factor. In the Sudbury district, for example, nobody has yet succeeded in smelting the ores pyritically, although many exceedingly able men have tried to do so with great persistence. The sulphur there is a direct disadvantage, requiring either the expense of a preliminary roast, if a high-grade furnace matte is desired, or else a large and expensive converter plant to handle the increased quantity of low-grade matte that would be produced by smelting green ore. The International Nickel Company has chosen the preliminary roast for its coarse ore; whereas, according to Mr. Corless, it is the intention of the British-American Nickel Corporation to follow the practice at Evje, smelting its coarse ore green and adding its fine to

the converters while 'blowing' the low-grade matte.

In most districts the problem is a complicated one, and skilled metallurgists hold divergent views. The reverberatory can be fired with a pulverized coal that is too low-grade for most uses, and much cheaper than coke; it offers the possibility of still greater fuel economy through the use of regenerative firing, rather than utilizing the waste heat for power generation; it avoids the cost of the power necessary for the blast; it is, with its roasting furnace, a complete plant in itself, smelting both fine and the flue-dust it produces. On the other hand, the advocates of the blast-furnace point to the expensive repairs, which are apparently inseparable from the structure of the reverberatory; to the higher slag-losses; to the necessity for grinding the ore, unless smelting a pulverized concentrate; and to the present experiment for reducing the fuel-cost of blast-furnaces by blowing pulverized coal through the tuyeres. The last, however, is still in the experimental stage. In defence of the reverberatory it must be said that in many plants it is merely a subsidiary department for smelting fine, for that reason not receiving the same care and attention as the larger department that does most of the smelting. Consequently it is, in general, not so economically run; repairs, necessarily high with that type of furnace, become still higher due to lack of standard parts; supervision costs more; every item is likely to show a higher cost per ton than would obtain if the entire tonnage were being smelted in reverberatories. For this reason direct comparisons are sometimes misleading; even the higher slag-losses have come down at those smelters where the tonnage thus smelted has been large enough to justify changes of practice. This brings us to another factor, namely, the cost at any large plant of changing a method already in use. If a smelter is, for example, doing satisfactory work with blast-furnaces, the reverberatory must show a striking advantage to bear the amortization charge of a new plant, unless it is made necessary by a change in the character of the ore. Recently sintering and nodulizing have been coming to the fore; that is, fine ore is agglomerated by heat into lumps and then smelted in blast-furnaces. This promises to be a serious competitor of the reverberatory: it is in use at the plant of the Mond Nickel Company, in Ontario, and has been successfully applied to the ores of the Braden Copper Company. The problem is not to be easily dismissed. Mr. Corless has mentioned the desirability of a thorough comparison of the three methods of smelting 'fine', namely, sintering and smelting in blast-furnaces, smelting direct in reverberatories, and adding to the converter while 'blowing' a low-grade matte. To this list we might add a fourth, that is, grinding coarse ore and smelting in reverberatories. The recent development of high-duty ball-mills has reduced the cost of grinding large tonnages, and for ores that cannot be smelted pyritically, but still require roasting, this is an alternative that always must be considered. Such a comparison, made by a metallurgist experienced in this kind of work, would be of great value to the profession. In the meantime we shall be glad to see a thorough discussion of the subject in these pages.

The Copper of Sinai

American enterprise in mining has found ample scope within the continental limits of the United States, yet divagations to foreign parts have become frequent during recent years, largely on account of the nomadic instinct of the mining engineer. At the time when hostilities were begun in Europe, five years ago, American engineers were exploring old copper mines in the island of Cyprus and were hampered by the suspicion, entirely unfounded, that they were working in the interest of Germans. It is a long way from Los Angeles to Nicosia and its Cyprian hinterland, but even the mention of that association awakens shorter echoes in the halls of history than the examination of the ancient mines of the Sinai peninsula by an engineer representing the General Electric Company of New York. Mount Sinai and New York! That seems a far cry; but are they not complementary? The temptations of Manhattan give point to the Ten Commandments. Yet it was not the search for the tables of stone, but for copper ore, that took the New Yorker to Sinai. He found plentiful evidence of the work done long before Columbus sighted the western continent and long before even the British ancestors of the Pilgrim Fathers had ceased going about in a coating of woad. Sixteen years ago attention was drawn to the oil resources of the Red Sea and in the course of exploratory work along the north-eastern shore of that Arabian gulf the finding of slag-dumps at Wady Hebron awakened interest in the abandoned copper diggings of the Sinai peninsula. The slag assayed 2.77% in copper, of which 1.25%, or nearly half, was in coarse metallic grains. Other dumps pointed the way to the source of the ore at Mt. Samarah, where prospecting operations disclosed a series of veins containing oxidized copper minerals, and some chalcocite, in quartz traversing diorite. Reports were made by French and German, as well as British and American, engineers. The Frenchman disagreed with the German, as was proper, but the report of our Ally (or Associate?) is to the point and brief, so we like it. The French engineer, Mr. Jules Strap, considered the deposits as impregnations along lines of stratification in the "sandstone and schist"; he regarded the specks of chalcocite in the oxidized ore as a discouraging sign because "it has been observed in the Mediterranean basin that the presence of gray copper mixed with oxidized ores in the outcrops indicates a rapid exhaustion of the veins; besides, admitting that this exhaustion might not occur in this case, the surface indications furnished by the oxidized ore are not of sufficient magnitude to expect the presence of sulphide ores at the water-level in paying quantities." Mr. Strap's petrography was probably awry, for other geologists label the rocks differently, but his appraisal seems to have been justified, even the German professor, Dr. Friedrich Kolbeck of Freiberg, agreeing that the extensive surficial showing of copper is due largely to encrustation of the country-rock by malachite. At water-level, 250 feet below the surface, the sulphide minerals were

expected to predominate. Widths of ore ranging from 2 to 5 feet and assaying 5 to 15% in copper to a depth of 135 feet are mentioned in the progress reports by Mr. M. Wanner, who found an analogy between these prospects and the beginnings of the Anaconda mine at Butte. Another encouraging report was that of Mr. C. H. Stewart, of Alexander Hill & Stewart, probably the most competent of those whose opinions are available. In the end these prospecting operations were abandoned because the copper contents of the veins were too low to meet the cost of working in a locality rendered economically unfavorable by the lack of water and fuel. Old pits and ancient ruins, with bas-reliefs at the mine portals, testified to the time when slave labor was available and copper was so highly valued that the exploitation of these lodes might have been remunerative.

It has been assumed, by Brooks Adams in his fascinating book 'The New Empire', for example, that the search for copper was the incentive to the Egyptian invasion of the Sinai peninsula. Indeed Mr. Adams goes so far as to draw a romantic picture of operations so intensive as to have yielded sufficient copper to give economic dominance to the Egyptians and change the trade-routes of the ancient world. He says that the copper mines in the valley of Maghara were captured by Sneferu about 4000 B.C. and that by aid of the metallic output from these Arabian mines this ancient king brought Egypt to affluence and power, and so forth. In short, he weaves a very pretty story; but, as Huxley said, the tragedy of science is the killing of a beautiful theory by an ugly fact. In 1906, four years after the publication of Mr. Adams' book, a scientific description of the hieroglyphic tablets in the Maghara valley was issued by W. M. Flinders Petrie, the famous Egyptologist, whose skilful interpretation of these ancient monuments and careful observations in the mines themselves has punctured the pretty bubble of history blown by Mr. Adams. In his 'Researches in Sinai', Professor Petrie confirms the earlier inference of the late Henry Baerman, who, in a paper read before the Geological Society of London, described a geological reconnaissance made by him in this region during 1868, in the course of which he examined the ancient workings of Maghara and identified them as turquoise mines. Baerman, an English mining engineer well known to an older generation, described sundry small copper workings elsewhere on the peninsula, notably at Wady Khalig, and records the finding of a slag-dump in the Wady Nasb, close to a group of springs, where copper ore was smelted. The dump was 250 by 350 yards, but only 8 by 10 feet deep at the most. He found numerous clay tuyere-nozzles and remnants of acacia charcoal. The ore must have been "extraordinarily poor", he says, and the mining of it was only rendered possible by the fact that it was done "in a period when metals were of nearly uniform value" owing to the scarce production at only a few localities. Petrie observed sundry small heaps of slag and remnants of a furnace. Pieces of crucibles and part of a charge not yet reduced were likewise found by him.

Copper chisels were unearthed in the old turquoise workings, so Petrie concluded that copper ore was brought from other localities to Maghara and there smelted on a small scale for the purpose of fabricating tools, most of which, however, were made of stone. Numerous hammer-stones and stone picks for breaking the rock, in the search for nodules of turquoise, were uncovered. The plentiful flakes of flint scattered through the dumps are considered by Petrie as marking, not the systematic mining of the ancients, but the grubbing and gophering of the Bedouins, who for ages have sought for turquoise amid these old workings without themselves engaging in larger operations. The turquoise, a hydrous phosphate of alumina stained by the phosphates of copper and iron, occurs in veins and nodules in a sandstone of Lower Carboniferous age, as determined by Edward Hull, whose 'Arabia Petrea' is the record of his geologic investigation. In the sandstone the Egyptians excavated galleries and chambers. Petrie speaks of one gallery 24 feet long, 60 to 70 inches wide, and 100 inches high, and of a chamber 5 feet high by 20 feet wide. A room-and-pillar system of excavations was made in the turquoise-bearing sandstone by aid of copper chisels and moils, together with stone picks. The marks of these tools are yet to be seen. The Egyptian name for turquoise is *mafkat* and it is found in monuments of the First Dynasty, 5510 to 5247 B.C. Several attempts have been made, in modern days, to work these turquoise deposits, but they have served chiefly to destroy the remains of antiquity. Just before Petrie made his investigation, English promoters had obtained a concession from the Egyptian government and had taken from the Bedouins, or native Arabs, their ancient resource of turquoise-hunting in order to engage in mining on their own company's account. The enterprise proved a fizzle, but not before the invaders had smashed and destroyed quantities of priceless prehistoric monuments, which in the European market of museums were worth far more than all the turquoise they extracted. It was a villainous piece of vandalism, comparable to the Turkish destruction of the Acropolis at Athens. Petrie arranged with the Egyptian government for the removal of the remaining inscriptions to the museum at Cairo. Adams refers loosely to these inscriptions, particularly that of Sneferu. On the smooth natural face of the sandstone are found figures made by cutting into the surface of the rock, leaving the figures in relief. The largest tablet is 63 by 102 inches. Apparently the oldest mine not blasted into ruins was the one beneath the inscription of Sanekht, the seventh King of the Third Dynasty, about 4950 B.C. This tablet is in a spot that is hardly accessible and it does not make itself visible at more than ten yards; it records the conquest of the district by the Egyptians. This earliest sculpture is strong and true, the drawing is "full of correct character, though simply cut, without any elaboration", says Petrie. The various 'scenes', thus inscribed on rock so as to survive seventy centuries, record the doings of successive kings. That of Sneferu, about 4750 B.C., says: "Sneferu, the great god, giving

power, firmness, and life, all health and all satisfaction of heart for ever, smiting the countries." He smote his name across the centuries in any event, for there he stands in action engraved on stone that has weathered seven thousand years. Was ever a more lordly monument? On smaller memorial stones, or 'steles', set upright in the ground, are written the records of successive mining expeditions. Inscribed on these slabs of sandstone are the names of the staff, leaving space on which the lower workmen scratched their names, on blank ends and margins. A precise sub-division of labor was then, as in modern Egypt, the condition for obtaining great results from small minds. One inscription records the arrival of 734 men, indicating the large numbers that were employed. The Egyptians brought all their supplies of food, including water, on trains of 500 asses, across the desert from the shore of the Red Sea. Among the technical men several classes were recognized; one of them was the 'diviser of minerals', or prospector, called in Egyptian *mes en aati*. That this was an important position is shown by the fact that only two were employed on each of four expeditions in which from 300 to 450 men were engaged.

The survival of these inscriptions for seventy centuries is marvellous. Petrie says that "in many cases there does not seem to have been a single layer of sand-grains removed from the face of the rock in the historic period", and he says the lack of rainfall in this region since 5000 B.C. is evident. Hull, however, refers to "a little rain falling annually on the highest elevations" and says that "the chief sources of supply are the occasional thunderstorms, which give rise to floods that descend the valleys in impetuous torrents and with disastrous effects", as is proved by shingle, boulders, and driftwood in the Wady el Ain. That is why the inscriptions were placed high on the faces of cliffs. However, it is for the geologist to reconcile the facts; of the age of these memorial stones there is no doubt. They are the oldest mining records in the world. In a play called 'Miriam, the sister of Moses', performed recently at the Greek theatre, in Berkeley, the Israelites were represented on the Sinai peninsula after their miraculous crossing of the Red Sea. They captured an Egyptian "from the turquoise mines" and were about to use him as a guide instead of Moses, against whom some of them were conspiring. The historic accuracy of the reference to turquoise was probably less accidental than the poor elocution of the actor impersonating Moses, who, as we are told in the Bible, was defective in utterance and therefore let his brother Aaron do most of the talking. The Israelites escaped from Egypt in the reign of Rameses II, about 1270 B.C. The turquoise miners anticipated Moses and his tribe by 3700 years. On slabs of sandstone similar to the 'steles' the Ten Commandments were inscribed. By use of something like a divining rod Moses pointed to the place where a spring issued from the Carboniferous limestone of Sinai. That was long ago, but only half-way to the time when the miner under Sneferu first dug the turquoise.

DISCUSSION

Blast-Furnace v. Reverberatory

The Editor:

Sir—Recent progress in reverberatory furnace construction and operation has naturally led to increased discussion as to its merits. As frequently happens, there has been a tendency to over-emphasize the relative importance of the apparatus under discussion and to generalize rather too broadly as to its application. This is true particularly in the case of the discussion by Walter G. Perkins in your issue of July 19 under the rather unfortunate title, 'Exit the Blast-Furnace'.

The recent rapid advance in reverberatory smelting has arisen mainly from two causes: (1) the discovery and greatly extended use of flotation, which has contributed to recent profitable exploitation of enormous tonnages of low-grade copper-sulphide ores; (2) the successful introduction of coal-dust firing of reverberatories. This latter advantage of the reverberatory over the blast-furnace may soon be offset by the complete success of experiments now in progress in coal-dust firing of blast-furnaces.

These discussions, however, omit mention of two conditions that, when they are coincident, are of decisive importance to the engineer who has the responsibility of determining the type of furnace to be adopted. These two conditions are (1) the occurrence of pyrrhotite (and generally pyrite also) as a large proportion of the gangue accompanying the valuable mineral in the ore; (2) the location of the reduction plant within easy access to cheap power, generally hyro-electric. Usually the first condition alone is decisive, as in the Ducktown district of Tennessee. But the coincidence of the two conditions leaves the decision unquestionably in favor of the blast-furnace.

These two conditions exist ideally in the Sudbury nickel area. In this district, the great importance of which is not as widely appreciated as it should be, the reverberatory furnace will probably never be a serious competitor of the blast-furnace. Even for the treatment of fine ore and flue-dust, the reverberatory has already in this district one serious competitor and will, within a few months, have a second. At the smelting plant of the International Nickel Co. of Canada, lump ore is smelted, after partial desulphurization in roast heaps, in blast-furnaces. Fine ore surplus is treated in Wedge roasters and, together with flue-dust from all parts of the plant, smelted in a coal-dust fired reverberatory furnace. At the Mond Nickel Co.'s plant, however, which is under my management, all fine ore, together with the small

quantity of flue-dust formed, is sintered to lump condition on Dwight and Lloyd sintering machines and added to the blast-furnace charge. This method of treatment, which has been successfully followed for several years, has made it possible to eliminate heap-roasting and has reduced flue-dust from blast-furnaces to less than 2% of ore smelted. The British-American Nickel Corporation's staff has stated it to be its intention to follow the Norwegian practice at Evje, namely, to smelt the unroasted lump ore in blast-furnaces, making a low-grade matte for converting. The fine ore will be smelted in the converters, the capacity of which, in relation to the blast-furnaces, will necessarily be large. Thus the Sudbury district will illustrate three radically different methods of handling the fine ore and flue-dust problem. But it is a reasonably safe prediction that the reverberatory will not, in the near future at least, drive out the blast-furnace.

Even during the transition stage to leaner ores, when the silica content becomes so high that a considerable proportion of the ore treated will require concentration, it will be economical as well as quite feasible, as our technical staff has already demonstrated experimentally, to sinter on Dwight and Lloyd machines a charge containing a high proportion of a mixture of table and flotation concentrate. Not until direct-smelting ore is nearly exhausted and the stage of practically exclusive concentration of low-grade ore is reached, if ever, is the reverberatory furnace likely to become the principal smelting furnace under Sudbury conditions of ore composition and power.

At some future date, a comparison of the advantages and disadvantages of the three methods of handling the fine ore problem above outlined would be very interesting and of considerable value to metallurgists. The single purpose of this note is to call attention to one set of conditions in which the reverberatory furnace is not a competitor of the blast-furnace.

The Status of Silver

The Editor:

Sir—I have just read the contribution to 'Discussion' by Edwin D. Wolfe in your issue of August 16, entitled 'The Status of Silver'. Mr. Wolfe, after quoting from an article by me in which I said "Our Government by promising to buy silver whenever it dropped to one dollar per ounce prevented London from fixing the price

below that amount. In other words, it took the control of the silver market away from London," proceeds to demonstrate that the price of silver followed the sterling exchange market of London.

There is no conflict between the assertions of Mr. Wolfe and myself, although he apparently takes issue with my statements. London always has and does now largely control the price of silver because London is the buyer of probably 80% of the silver production of the world. As long as this is the case, and so long as thousands of separate producers are competing with each other to sell to this one great purchaser, London will control the price of silver.

The only thing that prevented London from reducing the price of silver below one dollar per ounce was the Pittman Silver Bill. To this extent the control of silver was taken away from London. It would have been more accurate if, in the quotation given above, I had said that "The control of London was limited by our Government."

It is also true that our Government did hold the price of silver down to \$1.01½ per ounce during the War as far as England was concerned. As England required all the silver that we could supply, this left China and Japan practically without silver to meet their demands. This condition naturally caused these countries to bid high for silver. If the Government had not been directing all the silver to the war zone, there would not have been such an acute demand in China and Japan, and it would naturally follow that their bids would not have been nearly so high. In other words, you cannot take isolated conditions to determine what would have been the price of silver. The fact remains that the price of silver is not \$1.30 per ounce at the present time and never has been since the embargo was lifted, although the demand in China and Japan had been cumulating during the period of embargo.

Our departments dealing with foreign relations and with finances bearing upon the War, for reasons which appealed to them, considered the holding down of the price of silver necessary as an aid to winning the War. There was a great effort made to fix the price of silver at 85c. instead of a dollar. In fixing the minimum price at a dollar it was accomplished through a general compromise. Without this compromise probably nothing would have been accomplished and silver would have sold down to 85c. per ounce, as it did sell at the time of the introduction of the Pittman Bill.

Upon the signing of the armistice the Government kept its promise and lifted the embargo on silver. This last act did not accomplish what silver producers predicted would be accomplished. I never expected that it would accomplish what the producers thought it would accomplish and never joined in the optimistic predictions that were made.

I stated in a recent article that one potent remedy would be the combination of the silver producers under the Webb-Pomerene Act for the sale of silver abroad. Such a step, in connection with the Government guaran-

tee of a minimum price for American silver, would complete America's control over silver. To what price silver might then go depends upon too many various monetary considerations for me at this time to venture an opinion.

I think we will all agree that at the present time silver is in a much happier state than gold and probably any other metal. Its future is even brighter.

KEY PITTMAN.

Washington, September 5.

Another Skip-Changing Device

The Editor:

Sir—I was particularly interested in reading Oliver E. Jager's description of the skip-changing device at the Steward mine in your issue of August 9, because I am working on a similar problem at the present time.

The Cleveland-Cliffs Iron Co. is at present replacing with reinforced concrete structures the old wooden headframes at the Cliffs Shaft mine. This mine is opened by two vertical shafts 820 ft. apart, in each of which there is only one hoisting compartment. This necessitates the changing of the skips for cages every half-shift. This is accomplished rather satisfactorily in a manner that I shall presently describe, but the new shaft-houses will make possible the use of a double-decked cage, instead of the single-decked one that we are now using, and the increased height of the cage makes some overhead method of support desirable.

The skip when empty weighs five tons, and the cage about three tons. Half the weight of the cage was added purposely, and it is not likely that the double-decked cage will weigh any more than the one we are now using, but its centre of gravity will be much higher. The method of changing skips and cages is shown in the accompanying drawing, which shows a plan and elevation of the lower part of the shaft-house.

The guides *A* are 24 ft. long, and are hinged at the top, so that they can be moved outward from the hoisting compartment at the bottom. This movement is accomplished by a toggle-switch, which has a throw of one foot. This movement is sufficient to remove the runners entirely from the guide-flanges on the skip or cage.

The drawbridge *B* is hinged on a heavy axle of 4 by 4-in. steel, and is counterweighted so that it is easily raised or lowered, and stays up or down without fastening. On it is laid a 24-in. gauge track of 40-lb. rails.

Directly in front of the shaft is a wide-gauge track at right angles to that on the drawbridge. This is set at a lower elevation, so that the rails on the trucks *C* and *D*, which are duplicates, are at the same elevation as those on the drawbridge when it is down. The trucks *E* and *F* are built specially to receive the cage and skip. They run on the tracks on trucks *C* and *D* or on the drawbridge. All trucks are equipped with roller-bearings.

The socket on the end of the hoisting-rope ends in a clevis, of which the bolt is fastened by a chain so that it cannot be dropped down the shaft, and there is a hook just above the clevis to hold the nut, when the bolt is re-

ELEVATION LOOKING WEST

ELEVATION LOOKING SOUTH

moved. This nut is also fastened in position on the bolt by a pin on a chain.

The method of changing is simple. The skip is hoisted far enough above the collar to allow the drawbridge to be lowered, truck *C* is moved to such a position that the rails on its top meet the rails on the drawbridge, and the rails are then locked with a sliding fishplate. Truck *E* is then run on the drawbridge directly under the skip, the skip is lowered upon it, the runners thrown back, and the hoisting-rope slackened till the bolt can be taken out of the clevis. When the rope has been disconnected, the skip is pushed off the drawbridge upon truck *C*, which is then pushed to one side. Truck *D*, with truck *F* and the cage on it, is then pushed into place in front of the shaft, and the process reversed.

This is done at least four times each day, and takes from five to six minutes for each round trip, that is, from cage to skip, and back from skip to cage. I have timed the operation many times with a stop-watch, and the average is close to five minutes. The time of changing will be difficult to reduce, but unfortunately it now takes six men to do the work, and it is heavy work for some of them, especially in the winter, when there is likely to be ice on the track.

The difficulty which our present method will present, when we try it on the double-decked cage, will be the instability of the high light cage, and the difference in the height of the cage and skip. We have two methods of overhead handling under consideration, one of which is very similar to that described by Mr. Jager, but I think

PLAN

he has given me some hints that will enable me to improve on my original plan. I hope that my description of our method of changing skips and cages, which, by the way, has been in use for ten years, may be of similar benefit to other readers of your paper.

LUCIEN EATON.

Ishpeming, Michigan, August 11.

The French Process

The Editor:

Sir—In your review of mining in British Columbia, in your issue of the 23rd inst., you head a paragraph, 'Failure of the French process', for the treatment of complex zinc-lead ores. You are quite unwarranted in making this statement. The plant at this place was only operated, about two years ago, for part of four days and during that short period the results were quite satisfactory.

Failure to operate the process is due to other causes altogether. The company has been struggling for over three years, mainly as the result of a hurriedly drawn up and bungled agreement with the government of British Columbia, which made it impracticable to obtain the necessary capital to put the process to a commercial test, but also to the incomprehensible and paralyzing methods adopted by that government, ostensibly in safeguarding the spending of the money which they have guaranteed to the extent of \$65,000. In the matter of who is to blame for the probable loss of this money to the country, I ask you and your readers to suspend judgment, until after the investigation, which I have already notified the Premier I shall demand. For your own information, I enclose a copy of correspondence with the Premier, which still remains unanswered after three months—a not uncommon occurrence.

The coupling of my name with the failure of any process is unjustified, and I hope this letter will remove an impression that might otherwise have the effect of seriously damaging my reputation.

THOS. FRENCH.

Nelson, B. C., August 26.

The Quicksilver Industry

The Editor:

Sir—As a producer of quicksilver I have been interested in the letters you have published on the quicksilver industry and its protection. To quote, in part, the letter of Mr. F. F. Sharpless in your issue of August 23: "In the various official reports that have appeared stress is laid upon the fact that the grade of ore treated in this country has been, for several years, growing lower and lower with no hope of improvement in this direction. That consequently the industry is a declining one which no reasonable protection will bring into activity again, and it may be expected that instead of any permanent or gradually diminishing protection being adequate it will be necessary to continually increase this protection. If those who are personally acquainted with the quicksilver resources of this country can refute this assertion with the proof of the existence of substantial supplies of commercial ore they will add one very substantial argument for the protection desired."

It is not possible to prove the existence of substantial supplies of ore until they are blocked out, usually in a mine. This is the ultimate object of development work. Under ordinary conditions, a deposit, to be developed,

must afford reasonable assurance of making a profit; at least, that it will not cause a loss.

When the market for the product is high, there is a great incentive to develop the ore. If it is certain that the high price for the product will obtain for but a short time, the object is to produce as much as possible during that time; no development work for the future being done and the deposit is, in many instances, ruined for future operation. If there is a fair chance of a continuously profitable price, the deposit is developed with care, good equipment is installed, and as much development work done as can be afforded. Advantage is taken of the extraordinary high price under which the enterprise starts to get it on its feet and in shape to meet the future.

The Big Bend district of Texas and across the Rio Grande in Mexico shows cinnabar deposits over a great area. It is not true that the grade of these deposits is growing lower and lower. The fact is, little work has been done on them and they are growing in neither direction. They are low-grade and the uncertainty of the market destroys their attractiveness. There is more than a fair chance that with careful development the quicksilver industry of this district would grow, and in all probability become a valuable resource of the Government in time of need.

The one essential to development is that a market affording a reasonable profit be assured. This assurance can be given only by a protective tariff on quicksilver and its compounds. An excessive tariff is not required but it can be shown that \$75 per flask of 75 pounds is a reasonable estimate of the cost of production from low-grade ores. An assured selling price of \$100 per flask would result in careful development of cinnabar deposits. It is understood that, as the matter stands, European producers can deliver to and sell in this country at \$35 per flask. Such action would stop all development in this country; in fact, it would destroy the industry.

Study Butte, Texas, August 30.

E. M. GLEIM.

ELATERITE is the common name for wurtzilite, one of the hard varieties of native asphalt, closely similar to gilsonite and grahamite. It is one of the natural hydrocarbons, being composed of 12.23% hydrogen, 80% carbon, and 5.83% sulphur. In 1917, 34,349 tons of gilsonite was produced, as compared with 821 tons of elaterite. Practically all of the elaterite produced in this country comes from Uinta county, Utah, although there are gilsonite mines in both Uinta and Duchesne counties. Refined elaterite is used principally in the manufacture of marine and iron paints, acid-resisting compounds, and other protective coatings, and in the manufacture of rubber. The demand, though small, appears to be steadily increasing as a consequence, it is believed, of the successful employment of this mineral as a primary constituent of prepared flooring. Development of the elaterite deposits in Utah has been retarded by the restricted market for the material, and by the location of the deposits remote from railway transportation.

The President Among the Miners

By T. A. RICKARD

On September 12 the President of the United States delivered an address on the League of Nations at Coeur d'Alene, a town in the mining region of the same name that has made Idaho famous. I happened to be on a visit to the Bunker Hill & Sullivan mine, at Kellogg, and eagerly availed myself of the opportunity to hear the President afforded by the courtesy of my host, Stanly A. Easton, the manager of the mine.

Coeur d'Alene is 42 miles from Kellogg, Idaho; so this is the story of a motor journey and a speech. The motor journey comes first, but the reader can skip it, if he wishes, although I could not.

It was dark and raining heavily when we started at 5:20 a.m., bowling along the cemented pavement that forms a new feature of the settlement clustering around the portal of the Kellogg adit, which is the main entry to the workings of the Bunker Hill mine, now 3500 feet below the surface. The several mill-buildings and the smelter were "lit up like a church" as we passed these evidences of industrial activity that has made the Bunker Hill the premier lead producer of the world. In 1917 the Bunker Hill & Sullivan Mining & Concentrating Company produced 50,000 tons of lead and 1,800,000 ounces of silver, the aggregate value of this output being \$9,500,000. Soon we were off the cement pavement and on a macadamized road, but despite frequent puddles the going was good as we splashed through the rain down the sandy flats of the south fork of the Coeur d'Alene river, crossing the railway from Spokane at Cataldo, a name recalling the Jesuit fathers who were the pioneers of the region and founded the Mission, a mile below Cataldo. Father Ravalli and the other French missionaries erected this wooden sanctuary in 1846 and from it extended their beneficent activities among the Indians. The dawn was now breaking through the rain-clouds and we could see the old church silhouetted against the dark wet pine-woods of a mountainous background. For forty years the Mission was the head of navigation on the Coeur d'Alene lake and river, and the point of departure for exploration into the mineral hinterland now made famous by such mining centres as Wallace, Wardner, Burke, Mullan, and Murray.

More immediately important than these historic reminders was the fact that the Mission flats are clayey, so that our car began to skid, being saved from ditching only by the chuck-holes in the road. Eight miles farther, and 19 miles from Kellogg, we stopped to attach chains to our rear tires. This took 25 minutes, during which three automobiles passed us, not without friendly greetings to Mr. Easton. We had the satisfaction of overhauling and passing them within a few miles, for we were in a Franklin roadster, a machine peculiarly suited

to adverse conditions. Shortly after attaching the chains we entered Fourth of July canyon, so named by Lieutenant John Mullan, who came this way on July 4, 1854, as was duly recorded by him on the blazed face of a pine near the head of the canyon. This record survives and it is proposed to preserve it as a historic landmark by erecting a fence around it. We were traveling on what is known as the Yellowstone Trail, which is destined to be the motor highway between Seattle and Chicago. As I saw it, and felt it in my bones, it was no Apache Trail or Camino Real, and it required the eye of faith to conceive the changes that would be necessary before this engineering feat would be consummated. For ten miles before passing the Mission we had driven on the abandoned railroad grade that used to be the right-of-way of the narrow-gauge line, built in 1887 by the late D. C. Corbin, the famous railroad builder of the North-West, between Burke and the Mission landing. This railroad was abandoned in 1896, when the Union Pacific's standard-gauge line reached out from Tekoa, Washington, into the Coeur d'Alene country. After entering the Fourth of July canyon we traveled for a mile on the newly reconstructed road; then we were compelled to make a detour among, and over, the stumps and stones of the creek-bed for another mile, during which we tested the resilience of the hickory, aluminum, and rubber of the Franklin car. Here we passed sundry lame ducks on the way, like ourselves, to hear the Chief Executive. Then came a climb up the steep grade, three miles long, that culminates at the Burns summit. This is named not after the poet but after "a long-whiskered stiff who lives at the mouth of the canyon".

Half a mile below the summit we passed a new neat-looking log cabin, which I was told had been ostensibly a gasoline-supply station but actually had served as the seat of a boot-legging industry, namely, an illicit distillery, fully equipped for making a barrel of spirits daily. The chief of these enterprising manufacturers was Ole Linn, a Scandinavian, more honorably known as the discoverer of the noted Sixteen to One mine, on Nine Mile creek. The bootleggers had a great variety of labels, so that the thirsty traveler could obtain anything from Haig & Haig to Sunnybrook.

Next we slid down-hill to Wolf Lodge creek and there hurdled over a big logging-flume by aid of a short bridge so sharply arched that it seemed impossible for a car of long wheel-base to clear it without knocking its drip-pan or differential. The 'negotiating' of this obstacle was made more interesting by the deep chuck-holes that pitted the approach. Just about this time Mr. Easton murmured something about having "a boulevard this time next year," which was most consoling. On the next

hill, above Blue Creek, we passed more motor-cars in obvious difficulties, but not in danger. It was still raining, but the clouds were forming and there was hope of the weather clearing. The face of nature had been washed clean and the forest looked spick and span. Among the pine-clad ranges nestled small valleys checkered by cultivation, chiefly corn, small fruits, and vegetables. Soon we obtained a glimpse of Coeur d'Alene lake, or an important arm of it. Here I may interject the remark that Coeur d'Alene means 'the heart of the awl'. It was a name given by the Indians to a sharp trader and by him and his companions adopted as a name for the Indians and the region they inhabited.

Meanwhile, speaking geologically, we had been crossing the rocks of the Lower Belt series, chiefly quartzite and slate, but now the road began to cross the Columbia River basalt, a flow of Tertiary lava that has determined the topography of this region and created the basin of the lake itself. The columnar structure of the basalt could be recognized on the roadside. I may add, as another geological item, that before reaching Cataldo we could have seen, if it had been daylight, and as I saw two days later, the big granitic boulders that mark the eastern edge of the Glacial ice-sheet, which, descending from the North, blanketed the whole Columbia River country in the days before the foot of man first broke the silence of the primeval wilderness. Descending Nigger Head hill, so named on account of the dark eroded tops of the basaltic columns, we entered upon a fine stretch of road bordering the lake and in a few minutes passed the big saw-mill that marks the northern limit of the city of Coeur d'Alene.

We arrived at Coeur d'Alene at 8:50 and lost no time in housing the automobile and then walking through the town to the place of meeting. This was Blackwell Park, formerly the Fort Sherman reservation. A large tent had been erected and seats had been reserved for delegations from various parts of the Inland Empire, as the Idahoans call their State. Badges had been distributed the day before, so that there was no confusion. Indeed, the arrangements were admirably conceived and efficiently executed, doing much credit to Mr. Robert H. Elder, who, as a member of the National Democratic Committee, had charge of the affair. At 8:50 the President was due at Rathdrum, a station on the Northern Pacific railroad, on his way from Billings, Montana, to Spokane, Washington. He and his party were to come in motors from Rathdrum, which is 17 miles from Coeur d'Alene. This was the only place in Idaho in which he was to speak; probably he wished to deliver an address in at least one town in Idaho and the capital, Boise, was too distant from his itinerary; probably also he wished to speak at least once in William E. Borah's bailiwick, for that Senator is one of the bitterest opponents of the League.

We found our seats readily and watched the assembling of the audience. The tent had a seating capacity of 3000; benches had been provided for only a third of this number, leaving standing-room for more than twice as many. By the time the President arrived fully 4000

people were in the tent. National flags hung behind the platform, which was decorated with small flags and Sweet William, or flox; and a large bouquet of the same pink flowers stood on the speaker's table. Three electric lights hung overhead, for, although the rain had stopped, it was a dull morning. From the flag behind the platform there hung a bad lithographic portrait of the President—an unusual and inappropriate decoration, and quite unnecessary, because the cinemas have made us thoroughly familiar with Mr. Wilson's face, pose, and gestures.

While awaiting the arrival of the President, I chatted with the neighbor on my right, H. S. Hull, the Prosecuting Attorney for Shoshone county, and a Democrat. It will be remembered that although Idaho elected a Republican legislature and a Republican State ticket, it gave its presidential vote to Mr. Wilson. Mr. Hull considered him "the greatest master of the English language that had been in the White House"; then he added "at least in recent years," hinting at Lincoln. When I suggested that Lincoln was the greater master of the language, Mr. Hull demurred, insisting that Mr. Wilson had "a more scholarly knowledge of the language and had been favored with better opportunities to acquire skill in the use of it." I did not express my further disagreement. Speaking of Mr. Borah, Mr. Hull asserted that the Senator had lost caste by his tactics, for he had surrendered his judgment to bitter partisanship; the proceedings in the Senate did not reflect public opinion, for sentiment on behalf of the League of Nations is not divided on party lines, "except in so far as leadership at Washington drags that way." He referred to Senator Borah's opposition to sending our soldiers to Europe on the ground of foreign entanglements, yet the Senator had favored American interference with the Irish question and supported the delegation that went to Europe; indeed, Borah had proposed a resolution asking the Peace Conference to take cognizance of the Irish question. This, Mr. Hull thought, served to indicate an inconsistency nourished on illogical partisanship, rather than upon steady patriotism. Behind me a man was reading one of Senator Johnson's speeches. On my left, Mr. Easton, a Republican, was preparing to listen sympathetically to the President, for he favors the adoption of the Covenant as a means of preventing war. As far as I could ascertain the Republicans in this mining region were just as eager to see and hear the President as the Democrats; indeed, his most bitter opponents appeared to be members of his own party, like Harry L. Day, of the Hercules and Tamarack mining companies.

At 9:50 a flap of the tent was raised behind the platform, disclosing Grand Army veterans drawn up in line. At 9:55 C. H. Potts, formerly a State Senator, announced that the President would arrive in ten minutes. He did not, but the announcement was welcome. At the same time Senator Potts, as he is called in memory of his former legislative distinction, requested the ladies to remove their hats, and, as if to show impartiality to the sexes, the men were requested to cease smoking. This provoked laughter. Various delegations were still ar-

iving, the last being one from the St. Joe River country; this had come on a special steamboat down the river and lake. It filled the seats in front of us. By this time the tent was jam-full. I was glad we were not in a hall, for the apertures in the canvas ensured fairly good ventilation.

At 10:15 the sounds of approaching automobiles excite expectation. The tent is opened again behind the platform, disclosing a large crowd waiting and a brigade of 'movie' photographers standing on cars behind the G. A. R. veterans. The thumping of drums heralds the local band, which marches into the tent led by J. V. Hawkins, the postmaster of the town. Then service men in military uniform are received with hearty applause as they take their seats inside. The President is now seen standing in a car engaged in removing his overcoat and by his side is Mrs. Wilson with a large bouquet of red roses. He enters, accompanied by eight Secret Service men, his Secretary (Mr. Tumulty), and his physician (Admiral Grayson) in uniform. The band plays *at* the 'Star-Spangled Banner'. All rise and cheer, but not so excessively as the newspapers suggested. The President and his wife are smiling and bowing. A pause ensues while the party on the platform seats itself. It is now 10:20. David W. Davis, the Governor of Idaho, steps forward. He is a Welshman by birth and used to be a coal miner in Pennsylvania. He speaks to the point and is wisely brief. A Republican himself, he emphasises the fact that the audience is there to meet the President without regard to party affiliations; "the Gem of the Mountain" (that is what Idaho, an Indian word, means) gives to the President the "most generous and sincere greeting that a commonwealth could give to the Chief Executive of the Nation." Mr. Davis indicates the largeness of this commonwealth by stating that it had taken him from 5:25 p.m. on Wednesday until 11:30 p.m. on Thursday to come by rail from the capital of the State to Coeur d'Alene.

The President is wreathed in smiles as he steps forward and shakes hands with the Governor. He expresses appreciation of the invitation to remain longer in Idaho and refers to Washington as "a very interesting place, but it is a very lonesome place." This is received with laughter, of course, and the laughter is renewed when he says that "the people of the United States do not live there."

The President's face bears a latent smile, the result of his frequent appearance in public, and it broadens readily. His enunciation is delightfully clear; he says A-me-ri-ca and A-me-ri-can, giving each syllable its full value. At first he made all his gestures with his left hand, in which he held a slip of paper, bearing notes presumably. His right arm rested at his side. Later he dropped his left and used his right, pointing with the index finger as he scored those who were "opposed to the ratification of the treaty of peace with Germany altogether." He punctuated his speech with "fellow countrymen," and, curiously, began it by addressing the Governor as "Your Excellency". This was overlooked by the press reporters, but it is noteworthy, because

whereas precedent warrants the use of 'Your Excellency' when addressing the President of the United States, it is surprising that the President should so address the executive of a State. It might be taken as placing an emphasis on State rights! Mr. Wilson has a good and full voice, but it is not especially musical or oratorical; it has a slightly reedy timbre, but he speaks with unusual clearness and places his emphasis on the right words, a characteristic of all really effective speakers. He looked well and hearty, a remarkably vigorous and alert man, despite his 63 years. Most of us, I think, were agreeably surprised to see no signs of physical weariness, notwithstanding his arduous campaigning across the continent.

His face bore a near-smile most of the time, but it became stern as he referred to "the outrageous thing" Germany had attempted. He carried the audience with him as he said: "Germany attempted to do outrageous things, but Germany is not the only country that has ever entertained the purpose of subjecting the peoples of the world to her will. And when we went into the War we said that we sent our soldiers across the seas, not because we thought this war an American fight in particular, but because we knew that the purpose of Germany was against liberty . . . After long hesitation, after trying to persuade ourselves that this was a European war and nothing more, we suddenly looked our own conscience in the face and said, 'This is not merely a European war; this is a war which imperils the very principles for which this Government was set up [right hand raised with an authoritative index-finger]; and it is our duty to lend them the forces we have, whether of men or resources, to the resistance of these designs. . . . It was America—never let anybody forget this—it was America that saved the world.' Describing German ambition and her purpose to make "an open line of dominion," he extended his right hand forward; and when he spoke of the German dream to "open the gates of India" he swung his hand laterally. The purpose of the Treaty was to "set up the very states that Germany and Austria intended to dominate." We have given to these smaller countries a title to their lands; "they never did belong to anybody else; they were loot; it was brigandage to take them; we give them in fee simple" to their rightful possessors. "But what is the use of setting up title if we do not guarantee it. And that guarantee is the only guarantee against the repetition of the war we have gone through, just so soon as that great nation, 60,000,000 strong, can again recover its strength and its spirit."

He dwelt upon the "intolerable" conditions in Europe; the sorrow, dread, and unrest. "America is necessary to the peace of the world. Germany realizes that; and I want to tell you now and here—I wish I could proclaim it in terms so loud that they would reach the world—Germany wants us to stay out of this treaty [applause], not under any deception, never under the deception that we will turn in sympathy toward her, not under the delusion that we would seek in any direct or conscious way to serve Germany, but with the knowledge

that the guarantees will not be sufficient without America; and that, inasmuch as Germany is out of the arrangement, it will be very useful to Germany to have America out of the arrangement, because Germany knows that if America is out of the arrangement, America will lose the confidence and co-operation of all the other nations of the world; and, fearing America's strength, she wants to see America alienated from the states from whom she has been alienated. She wants to see America isolated. She is isolated. She wants to see one great nation left out of this combination which she never would again dare face." [Loud applause.] This he said with grave emphasis, using the index-finger of his right hand to make his points.

He stood still, hardly moving two feet during the whole of his speech. His pose was restrained and self-contained throughout. He referred to German propaganda. "Evidence is not lacking, nay evidence is abounding, that the pro-German propaganda has started up in this country coincidently with the opposition to the adoption of this treaty. I want those who have any kind of sympathy with the purposes with which we went into the War to reflect upon this proposition: Are we going to prove the enemies of the rest of the world just when we have proved their savior? The thing is intolerable; the thing is impossible. America has never been unfaithful and it never will be unfaithful." The canvas of the tabernacle shook with the thunder of applause that greeted this splendid sentiment. It was followed by another fine utterance. "Don't let anybody delude you, my fellow countrymen, with the pose of being an American. If I am an American, I want at least to be an intelligent American. If I am a true American, I will study the true interests of an American. If I am a true American, I will have the world vision that America has always had, drawing her blood, drawing her greatness, as she has drawn her people, out of all the great constructive peoples of the world.

"The West is a country of progressivism, and I am not using the word with a big P." This provoked smiles. "It does not make any difference whether you belong to the Progressive party or not; you belong to the progressive thought. [Applause.] It is the only thought that the world is going to tolerate. And if you believe in progress, if you believe in making the lot of men better, if you believe in purifying politics and enlarging the purpose of public policy, then you have got to have a world in which that will be possible . . . There will be no reform in this world for a generation if the conditions of the world are not now brought to settled order; and they cannot be brought to settled order without the co-operation of America." [Applause.]

He did not indulge in rhetorical confectionery; he was argumentative and persuasive. A denunciation of the policemen's strike at Boston evoked hearty concurrence. "When the police of a great city walk out and leave that city to be looted, they have committed an intolerable crime against civilization." [Loud and long applause.] Of course (I venture to add), the policeman is the symbol of law, the expression of the one thing that

stands between man and the jungle. Again he spoke of the suffering in Europe as he himself had seen it and of the dependence of the European people upon American action in bringing the world to settled conditions. "A chill will go to their hearts, a discouragement will come down upon them, cynicism will take possession of them which will make progress impossible, if we not only do not take part, but do not take part with all our might and all our genius. Everybody who loves justice and who hopes for programs of reform must support the unqualified adoption of this treaty." Cheers and shouts greeted this climax. He proceeded to say that "if you want to have your own fortunes held steady, you must realize that the fortunes of the world must be held steady; if you want to keep your own boys at home after this terrible experience, you will see that boys elsewhere are kept at home." The hope of keeping out of war was instantly applauded. "Having given this proof once, I pray God we may not have occasion to prove it again. We went into the War promising every loving mother that we were going to fight a war which would make that sacrifice unnecessary again; and we must redeem that promise or be of all men the most unfaithful." Here he struck a responsive chord; the audience expressed intense approval. "This league, my fellow citizens, is a league to bring about the things that America has been advocating ever since I was born. It is a league to bring it about that there shall not be war, but that there shall be substituted for it arbitration, and the calm settlement of discussions."

Then came an interesting mention of a clause in the Naval Appropriation Bill, a clause whereby he, as President, was directed by Congress to bring about disarmament. "Congress, authorizing a great building program of ships, and the expenditure of vast sums of money to make our navy one of the strongest in the world, paused a moment and declared, in the midst of the Appropriation Bill, that it was the policy of the United States to bring about disarmament and that for that purpose it was the policy of the United States to co-operate in the creation of a great international tribunal, to which could be submitted questions of international controversy. And it directed the President of the United States, not later than the close of this war, to call together an international conference for that purpose. It even went so far as to make an appropriation to pay the expenses for the conduct of such a conference in the city of Washington. And that is a continuing provision of the Naval Appropriation Bill." He asserted that he had fulfilled the mandate of Congress when he came back from Europe with the covenant of the League in his pocket. "And now they don't like it!" he exclaimed, amid general laughter. "There is only one conceivable reason for not liking it, my fellow countrymen, and to me, as an American, it is not a conceivable reason, and that is that we should wish to do some nation some great wrong. If there is any nation in the world that can afford to submit its purposes to discussion, it is the American nation."

The speech did not end here, but I have given the gist of it. The closing periods were marred by the buzz of

an aeroplane closely overhead, distracting the attention of the audience. This aeroplane took photographic films to a newspaper at Spokane. His concluding words were as follows: "It is with the solemn thought that we are at a turning point in the destiny of mankind and that America is the make-weight of mankind that I, with perfect confidence, leave this great question to your unbiased judgment."

The wheezy band struck up 'America' as the President and his party descended at the back of the platform and took their seats in the motor-cars outside, returning to Rathdrum, on their way to Spokane. He had spoken for three-quarters of an hour. The audience was keenly intelligent and had too much sense to interrupt the flow of his argument with mistimed applause, but it was quick to recognize the telling points of the speech. The mining settlements had sent down a worthy representation and it was a pleasure to feel the touch of earnest citizenship. As we moved out I heard a voice say: "I guess he'll put it over; the people want it." That was my opinion at the moment. It was the first time I had seen or heard Mr. Wilson. He is a man of force and personal magnetism. As I listened to him, and came under the influence of his intellectuality and magnetism, it was difficult for me to realize that it was he who had been guilty of those unfortunate phrases, 'Too proud to fight', 'Peace without victory', 'With the origin and causes of this war we have no concern', and others equally lamentable. These were forgotten as I listened to him; they seemed to belong to somebody else; I saw only an attractive and scholarly gentleman, a clear-headed and accomplished speaker, and a forceful exponent of the American idea.

Next day I interviewed some of those who had gone from Kellogg to hear the speech, and thus obtained the impressions of a number of men representative of the mining community.

Ira ('Bud') Robson, a demobilized soldier and secretary to the manager of the Bunker Hill mining company, said: "It was a straightforward speech. He impressed me that he believed what he said. It changed my opinion about the League; I was sort of opposed to it when I went down; he has made me feel interested in it, for his arguments were strong."

Richard A. ('Dick') Brockman, engineer in charge of the power-plant, said: "It was very much what I have read in the papers. I expected something new. There was too much about the Treaty and not enough about the League. After going over such a bad piece of road, I expected something more worth-while."

J. E. Sturdevant, secretary of the Kellogg Y. M. C. A., said: "I am not in his class politically, but I was much impressed. I was surprised at what he said, perhaps on account of my political prejudice. He made out a pretty good case; without doubt, we ought to have a league, but not quite the kind he advocates. I want to hear what Johnson has got to say."

Daniel ('Dan') Straw, who works in the blower-house at the smelter, said: "What I could understand I thought all right. As to the League, he did not say much

about it, especially Article 10, which is more than I can understand. If it is for the benefit of America, I'm for it; but no common man has the education to decide on the question. That was such a hellova road and I am so shuck up that I can't think straight."

Peter Albinola, a native of Italy, an American citizen, a pioneer of the Coeur d'Alene, and a retired saloon-keeper, said: "It struck me as the best talk I ever heard. Whatever he said, he said through his heart, like a good American. That man is the very father of the country, not because I am a Democrat either. I can see nothing wrong with this League of Nations, although I read the papers carefully. Every time he speaks, he says something; some fellows make a hellova long speech and say nothing."

G. O. Parrish, pastor of the local Methodist Episcopal church, said: "To me Mr. Wilson is a great personality, so I expected to be greatly interested. His language is exceptionally clear and he is an idealist, of course; but he failed to convince me that the League in its present form should be adopted. I am already convinced that we do need a league against war, but he did not prove to me that the present covenant is the one to do it. He did not drive from my mind the idea that reservations are needed in order to conserve and preserve our American rights."

Quot homines tot sententiae. This does not refer to the saloon-keeper; but I do confess that when I tackled Mr. Straw I expected to ascertain which way the wind blew. Evidently he, Mr. Brockman, and others retained a lively recollection of the motor-ride up Fourth of July canyon and it is patent that the turpitude of the road influenced their mental processes as they listened to the Chief Executive. To me the road, with its slithers and chuck-holes, the rain overhead and the mud underfoot, served but to bring into relief the clearing weather afterward and the intellectual comfort of listening to a great man. As the horrors of the recent war had preceded the conference for a perpetual peace, so the minor discomforts of that journey were forgotten in the hope, expressed so eloquently by the President, of establishing stabilized conditions, in which "America should lead the world out of darkness into the light."

FLUORSPAR is utilized principally in the metallurgical, ceramic, and chemical industries. The bulk of the domestic output, mainly gravel spar, and practically all the imported spar is used as a flux in basic open-hearth steel furnaces, so that the demand fluctuates with the rise and fall in the production of steel. During 1918, 263,817 short tons, valued at \$5,465,481, was sold, compared with 218,828 tons, valued at \$2,287,722 in 1917. This represents an increase in quantity of 44,989 tons, or nearly 21%, and in value of \$3,177,759, or nearly 139%. The increase was caused mainly by the increased demand for steel for use in the War. Fluorspar was mined and shipped in Arizona, Colorado, Illinois, Kentucky, New Mexico, New Hampshire, Utah, and Washington. The average selling price per ton f.o.b. mines or shipping points for all grades of spar was \$20.72.

Some Engineering Features in Connection With the Utah Copper Company's Operations

By R. C. GEMMELL

THE BINGHAM & GARFIELD RAILWAY. In order to ensure the proper and economical handling of its ore, the Bingham & Garfield railway was built during 1910 and 1911 by the Utah Copper company. The road traverses the eastern slope of the Oquirrh mountains from the mines, at Bingham, to the mills and smelter, at Garfield; the distance on the main line from station to station being about 20 miles. Branch lines to other industrial points increase the total length of the line to 37 miles. Additional tracks for serving the Utah Copper company and other mining companies at Bingham total 43.5 miles. This, together with about 53 miles of yard and siding tracks, makes the total length of all tracks 133.5 miles, as shown upon the map, Fig. 1.

The Denver & Rio Grande railroad already had in operation a road between Bingham and Garfield; this followed a winding and circuitous route between the mines at Bingham and the Magna plant, the distance between these two points being 27.5 miles. During the spring of 1908, the Utah Copper company engineers made surveys which proved that a more direct line could be built without encountering insurmountable difficulties, and in the spring of 1910 it was decided to begin construction. Surveys were made and lines were projected on grades varying from 2 to 2.5%, and, at first, a maximum curvature of 12° was assumed. A maximum grade of 2.5% was finally adopted upon the assurance of locomotive builders that they could furnish an articulated Mallet compound engine capable of hauling 40 empty cars of 60 tons capacity up such a grade at an average speed of 12 miles per hour. It was found practicable, except in two cases, to use nothing greater than 8° curves. These two exceptions, namely, a 10° 10-ft. curve for the Dry Fork crossing and a 10° curve immediately below, were employed in order to effect large savings in the cost of construction.

The greater portion of the road consists of heavy cuts and fills along the mountain slope. Just above the town of Bingham, however, because of the danger to the buildings in the canyon directly below and because of the excessive curvature that would be required to follow the canyon closely, it was decided to use the more costly method of tunnels and high viaducts. Starting at the mine, the road first crosses Carr Fork canyon on a steel viaduct of the tower-and-girder type, 690 ft. long and with a maximum height of 190 ft. See Fig. 2. From this viaduct the line traverses the Bingham assembly-yards and crosses Markham gulch on a second steel tower-and-girder viaduct, having a length of 640 ft.

and a maximum height of 225 ft. After crossing Markham gulch, the track passes through four tunnels; the first is on a 3° curve, with a length of 1282 ft.; the second and third are on tangents, with lengths of 2085 and 773 ft., respectively, and the fourth is on a 6° curve, with a length of 682 ft. The last viaduct on the line—the one across Dry Fork—is also of the tower-and-girder type, with a length of 670 ft. and a maximum height of 188 ft. This viaduct is on a 10° 10' curve, the curve forming a horseshoe having a total angle of 195° 42'. The line from Dry Fork to Magna runs through rough country, along and across the foothills, necessitating heavy cuts and fills, which render construction expensive. See Fig. 3. The entire line from the assembly-yard at Bingham to the Magna plant has an average grade of 2.05%; the distance being 17.2 miles, and the elevation at Bingham 6331 ft., whereas the altitude at Magna is 4457 ft. above sea-level.

The tunnels are all single-track, 18 ft. wide and 22 ft. high above the top of the rails. About half of the length of the tunnels is unlined. Where timbering was necessary, the three-segmental arch, with timber-plates along the tops of the posts, was used. The timbered sections are rendered partly fire-proof by means of redwood strips, inch-boards being used on the side segments and two-inch boards on the top section. In order to economize labor and permit of more rapid progress in tunneling, a 'jumbo,' or loading machine, was so devised as to permit the excavation being done on three benches simultaneously. This 'jumbo' was so constructed as to allow the broken rock from the two upper benches, or headings, to run into the cars by gravity, but it was necessary to shovel the rock from the lower heading. This arrangement made possible an average progress of about five feet per day. In order to rush the work as much as possible, air-drills only were used. Two crews, advancing from each end of the openings, were employed at all times. The work was so well planned and skillfully executed that it was completed on time, and with no fatal accidents to mar the record of the achievement. After the tunnels were completed, in order to have an accurate record of the yardage removed and a sectional outline of the openings, a tunnel-sectioner was devised and used with good results.

The care of the drainage along the right-of-way in the more mountainous portions of the road proved to be difficult. The standard openings adopted were concrete arches, varying in span from 3 to 10 ft. The greatest difficulty in draining was encountered in deep steep

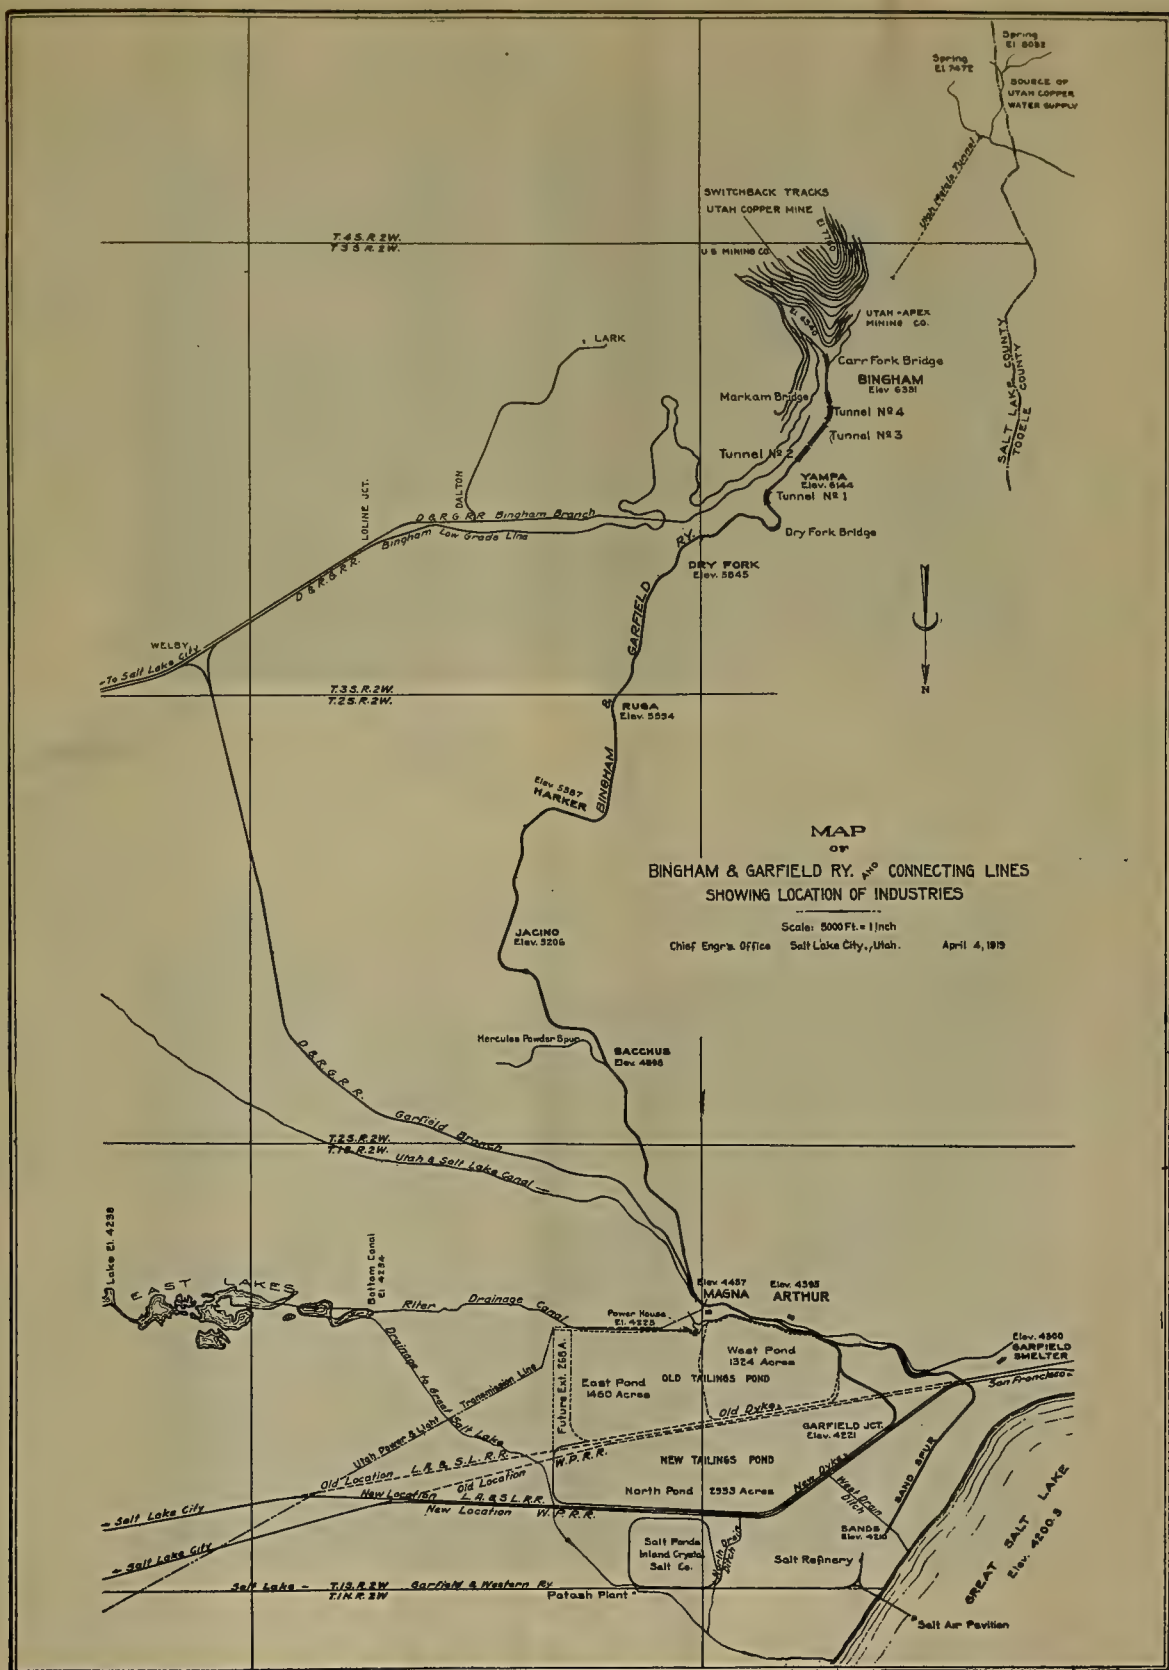

FIG. 1

gulches, where the greatest amount of embankment was required. In order to complete the work on time, it was necessary that the grading be done uninterruptedly; therefore it was decided to provide drainage by driving tunnels through the original ground, thus permitting the filling of the gulches without delay. Miners were employed in driving these tunnels, and this method of disposing of the drainage has proved satisfactory in every way.

The contract for the grading and concrete work was given to the Utah Construction Co. on March 30, 1910. Men, teams, and equipment were in place and in operation by the early part of May. Grading was started on April 17, 1910, and the line was completed by April 1911. During this period, the Construction company moved 746,970 cubic yards of solid rock excavation, 618,222 cubic yards of loose rock excavation, and 315,070 cubic yards of earth excavation; it drove 4795 linear feet of railway-tunnel, 818 linear feet of drain-tunnel, used 1,494,416 ft. B.M. of timber for lining tunnels, and placed 11,698 cubic yards of concrete. This is considered a remarkable record in railroad construction on such a comparatively short piece of line.

An ingenious plan, known as the 'Swede trap,' was used in excavating the deep cuts on the road. This scheme involves the driving of a small tunnel along the centre of the cut and just below the grade of the roadbed large enough to accommodate a small dump-car. This tunnel is then protected by timbers loosely placed over the centre and on the grade-line. The material to be removed, after being loosened by blasting, runs onto the boards above the cars and is allowed to fall into the cars in the tunnel below by removing the timbering as required. In some of the larger cuts, as much as 95% of the excavation was handled in this manner.

The contract for the steel viaducts, aggregating 3000 tons of structural steel, was given to the Kansas City Structural Steel Co. This company had the plates and girders fabricated by the Pennsylvania Steel Co. and the towers fabricated by the Minneapolis Steel & Machinery Co. The actual construction was done by the Garrick & Garrick Construction Co. The work had been so well planned and placed in the field, and the steel so accurately fabricated in the shops, that no difficulty was encountered when the viaducts were erected. The concrete piers upon which the towers are constructed are 5 ft. square on the top and 9 ft. square at the largest section. They are built with a batter of one-half inch per foot. The height of the piers varies from 12 to 96 ft., depending on the distance to bedrock, upon which all of them are founded.

The heavy-service tracks of the road are laid with 90-lb., open-hearth, A. R. A. section, series 'A' rail. All of the other tracks are laid with 65-lb., open-hearth, A. S. C. A. section rails. Ties of untreated Oregon fir, 7 in. by 8 in. by 8 ft., spaced 18 ties to a 33-ft. rail and fully equipped with tie-plates, are used. The tie-plates under the 90-lb. rail are 8 by 8½ in., whereas under the lighter rails 8 by 8-in. plates are used. All of the heavy-service

tracks are ballasted with one foot of crushed rock below the ties.

During the year 1918 the road handled 12,439,394 tons of freight, being an average of 34,081 tons per day. Since nearly all this freight is handled down-grade from the mines at Bingham to the mills and smelter at Garfield, it was found unsafe to operate with more than 40 ore-cars per train, using standard braking equipment, and from actual tests made, it was determined that it was not advisable to load these 40 cars with ore weighing to exceed 56 tons per car when using such standard braking equipment. Therefore, arrangements were made to equip the ore-cars with the empty and load brakes, manufactured by the Westinghouse Air Brake Co. The heavy Mallet type of locomotive had solved the problem of moving empties up the grade at a satisfactory speed, and this special braking equipment was required to permit the safe operation of the heavy trains down the grade.

The empty and load brake so operates as to increase the total braking power, giving practically uniform

braking power on car-units, whether empty or loaded, and regardless of the service in which they are being operated. The special braking equipment is entirely interchangeable with the standard freight-brakes, including the well known quick-service type 'K' retarded release and uniform re-charge freight-triple. In the actual road-tests when using the empty and load brakes, it was found that the cars could be loaded with 69 tons and that a 50-car train could be handled; at the same time maintaining a high factor of safety with a consumption of less than half the air by the standard equipment. Taken as a whole, this equipment has proved very satisfactory, holding the heavy trains to a uniform speed on the 2.5% grades.

The problems of construction and operation of the railroad at the mines were even more varied and complicated than on the main line. The mine being of the steam-shovel, or open-cut, type, it was necessary to construct railroads from the main assembly-yard at the base of the Utah Copper mountain to the various steam-shovel levels. There were 23 of these levels; the one at the top being at an elevation of about 1500 ft. above the bottom level. In addition to the tracks necessary to bring the ore down to the assembly-yards, long level lines were built to permit the removal of the large volume of cap. or waste, from the orebody. Owing to the necessity of continuous operations, the best way of providing facilities for transporting the ore from the various levels was by means of switchbacks, as illustrated in Fig. 4. In

FIG. 2. CARR FORK VIADUCT, WITH THE UTAH COPPER MINE IN THE BACKGROUND

FIG. 3. DRY FORK VIADUCT

order to hasten the mine operations and make them more flexible, the various steam-shovel levels are served at both ends by these systems of switchbacks, and the track-age at the mine is so inter-connected that it is difficult to conceive of an accident or set of unusual circumstances which could seriously interrupt the output of ore.

During the average day's operations, 65,000 tons of ore and waste are transported over the tracks at the mine. The trains are handled by two types of locomotives; the smaller is a 50-ton 4-wheel saddle-tank type; the larger is a specially designed 80-ton side-tank switching locomotive. The smaller engines haul trains of five cars, while the heavier ones are used to serve the upper steam-shovel levels and handle from 10 to 12 cars at a time. Owing to the excessive steepness of the grade on the switchbacks and the sharp curves over which the ore-trains must be moved, unusual care is taken in the operation of the trains up and down the mountain. The present system necessitates the use of flagmen placed at advantageous intervals in towers, from which their view is entirely unobstructed. It is required of the locomotive engineers that they get clear right-of-way signals before they are allowed to move their trains to the next level.

In addition to transporting the business of the Utah Copper company, the tracks of the Bingham & Garfield railroad are available to the various mines at Bingham for freight service; in other words, the entire district has unusually good freight-handling facilities. The road is connected with the Denver & Rio Grande railroad at Bingham and at Magna, and with the Los Angeles & Salt Lake railroad and the Western Pacific railroad at Garfield. Branch lines have been constructed to the Garfield smelter of the American Smelting & Refining Co. and to the Bacchus plant of the Hercules Powder Co., which plant manufactures practically all of the powder consumed in Utah and the adjacent States.

DISPOSAL OF TAILING. The Utah Copper company commenced active operations of its mine and of its experimental mill in Bingham canyon on the first day of July 1904. At that time the ore-reserves were estimated at 37,500,000 tons. The Magna plant at Garfield was started during the month of June 1907, by which time the ore-reserves had been doubled. By the end of the year 1910, the reserves had been increased to 203,500,000 tons by development and through the acquisition of the Boston Consolidated Mining Co.'s property; and at the close of the year 1911, they had been further increased to 301,500,000 tons. When operations were started in 1907, the tailing from the Magna plant, owned by the Utah Copper Co., and those from the Arthur plant, then owned by the Boston Consolidated Mining Co., were discharged to the north of the mills and impounded behind small dikes, which had been built to protect the property lying to the east and the Los Angeles & Salt Lake railroad, lying to the north.

The total area of the tailing-ponds was 3000 acres, and by the end of the year 1915 the dikes around this area had been raised to an average height of 20 ft. By this

time the estimate of ore-reserves had been increased to 390,000,000 tons, with a probability that much additional ore would be developed in the future. An investigation showed that in order to impound the ultimate tonnage of tailing, it would be necessary either to raise the dike around the 3000 acres to an average height of 80 ft., or move the Los Angeles & Salt Lake and the Western Pacific main tracks far enough north practically to double the area for tailing disposal. It was estimated that the cost of raising the existing dikes would be about \$1,680,000, and that the cost of purchasing additional ground, moving the two railways, and building the new north dike would be about \$860,000. Therefore the latter plan was adopted. One of the reasons for making this decision was the fact that if the Utah Copper company should store an enormous amount of tailing adjacent to the railway-lines for a distance of about four miles, with settling-ponds retained by dikes 50 to 100 ft. high, the impounded water and tailing would prove a continuous menace to the operation of the railways. After considerable time spent in negotiations with the officials of the railroad companies, their consent was obtained to the moving of their main-line tracks.

By this plan, the lands to be used solely for impounding tailing from the concentrating plants aggregate about 6000 acres. This area was bisected in an approximately east-west direction by the main-line tracks of the Los Angeles & Salt Lake and Western Pacific railroad companies, and it was necessary to move their tracks to the north a distance varying between 1 mile and 1½ miles for a length along the main lines of about 9 miles. The scheme also necessitated moving and extending the main line of the Bingham & Garfield railway near Garfield to a new connection with the Salt Lake route. The ultimate capacity of the pond will be sufficient to handle all the tailings rejected from the Magna and Arthur plants during the life of the property insofar as it can be estimated now.

By the appended map, Fig. 1, it will be noted that the new sites of the Los Angeles & Salt Lake and Western Pacific roads are parallel to each other and 100 ft. apart. In addition to railway construction, it was necessary to build about seven miles of dike around the new tailing-pond. The contract was given to the Utah Construction Co. at a unit price of 25 cents per cubic yard for all material on the railroad construction finished to a grade-line, and at a unit price of 20 cents per cubic yard for embankment in dikes, which it was not necessary to finish to any specified grade. Because of the wet condition of the ground, drag-line excavators were used. Ditches were first constructed to the Great Salt lake in order to drain the ground as much as possible before building the embankments for the two railroads. After the railroad embankments were completed, a tailing-dike was built, borrowing the necessary material from the inside. In all this work, the drag-line machines handled an average of about 22,000 cubic yards of material per month per machine. Concrete dewatering-boxes were constructed through the tailing-dike, and the dike was

FIG. 4. SWITCH-BACK SYSTEM IN CARR FORK CANYON

rip-rapped on the inside with slag obtained from the slag-dump of the Garfield smelter.

WATER-SUPPLY FOR THE PLANTS. On account of the greatly increased tonnage, it became apparent that more water ought to be secured for milling operations; therefore, some years ago, the Utah Copper company filed on 100 cubic feet per second of the surplus water of Utah lake. In order to deliver this water to the plants, it became necessary to purchase a right-of-way through the Utah & Salt Lake canal, and to enlarge that canal from its intake at the Jordan narrows to the reservoir at the Magna plant, a distance of 27.5 miles. The work was finished on April 29, 1918. The water is delivered through the canal at an elevation of 18 ft. below the bottom of the Magna reservoir, thus effecting a large saving in the cost of power over the former method of lifting all the water 220 ft. from the lagoon at the old Magna steam-plant.

There are times during the winter season when the flow of water in the Utah & Salt Lake canal is blocked by snow and ice. In order to ensure a sufficient supply of mill-water at all times, and as a protection against unforeseen accidents, practically a duplicate water-supply was secured by the purchase of 1325 acres of land lying about 9 miles east of the plants. The topography of this land is such that it forms a natural reservoir for the drainage from higher lands; but, nevertheless, its elevation is sufficient so that the storage-water can flow by gravity to the lower pumping-plant at Magna through a canal constructed for that purpose. The position of these eastern lakes is shown on the map, Fig. 1, as well as the position of the Riter drainage canal through which the water is delivered to the pumping-plant. It is believed that the present water-supply of the Utah Copper company for milling purposes is now such as to make practically impossible any combination of circumstances that would necessitate the closing down of the mills, or even any reduction in their capacity, because of water shortage.

Mining in Idaho in 1919

During the first half of 1919 mining in Idaho, as in other Western mining States, was less active than it had been for many years. This general decline was caused by the drop in the prices of metal and the high cost of labor and material. Several of the larger producing mines, such as the Hercules and the Tamarack & Custer, were closed when the price of lead dropped from 7.1c. per lb. in 1918 to about 5c. per lb. in April 1918. When the price of zinc decreased from 9.1c. to 6.49c. it was not profitable to market zinc concentrates, and the Interstate-Callahan, the largest zinc producer, was closed in March. This mine has since been re-opened. As the smelting plants had difficulty in marketing their product they were not operated at full capacity. At the Bunker Hill smelter only one lead furnace was in blast in March, and much pig-lead was in stock awaiting shipment. The Northport lead plant, which receives concentrates from

the Hercules and the Tamarack & Custer, was closed in April, but the East Helena plant (Montana) increased its shipments of bullion.

In 1918 the mines of Idaho shipped 503,437 tons of crude ore and concentrate, of which 417,155 tons came from the Coeur d'Alene district. In the first six months of 1919 the mines of this region were shipping at the rate of only about 250,000 tons per year, or at about 60% of their normal rate. In Lemhi county, which produced 11,200 tons of crude ore and concentrate in 1918, about the same average was maintained in 1919 from the Pittsburg Idaho, Latest Out, Gilmore, Sunset, and Pope Shenan properties. In Blaine county, however, the shipments fell from 6406 tons of crude ore and concentrate in 1918 to only an occasional shipment in the early part of 1919. Custer county was far below normal in its shipments of both copper ore and lead ore. The output of gold in 1918 was valued at \$702,816, a large decrease. There will probably be a further decrease in 1919. Dredging is now confined to the work at Murray, in Shoshone county. The output from deep mines in Idaho county is decreasing, leaving Boise and Shoshone counties the main sources of gold. In Lemhi county, on Carmen creek, a new concentration and cyanidation plant was installed at the Big Dyke mine, the ore of which contains gold, silver, and some lead. The production of silver in 1918 was 9,172,340 oz., valued at \$1 per oz. In spite of the higher price in 1919 there will probably be a decided decrease in the output, for the mines that produce lead-silver ore are making only about 60% of their normal shipments. A number of the big silver-lead mines were idle for several months. The output of copper in 1918 was 6,533,888 lb., valued at \$1,613,870. The Empire Copper Co., at Mackay, the main producer, reduced shipments from about 4000 tons to 1000 tons per month in 1919. The National mine, near Mullan, was shipping about 4000 tons of copper concentrate per month, but the Richmond, at Adair, was idle.

In 1917 Idaho produced 393,559,521 lb. of lead. In 1918 the total output was 294,695,993 lb., which may be cut in half for 1919 unless conditions improve materially during the later part of the year. The Bunker Hill & Sullivan mine has maintained good production, as have the Hecla and Gold Hunter; the Morning mine has been operating on a reduced scale and several of the lead mines are curtailing production awaiting a better market. Since the first of the year the large tailing pile at Sweeney is being treated in the old Federal mill now owned by the Bunker Hill company. An article describing this in detail appeared in the 'M. & S. P.', August 30, 1919. The decrease in the production of zinc has been greater. In 1917 the mines of Idaho produced 79,854,136 lb. of recoverable zinc and in 1918 only 45,161,712 lb. With the Interstate-Callahan idle part of the year and the Success and Highland Surprise closed there is every indication of a much smaller output in 1919. Zinc concentrate is being shipped from the Morning mine of the Federal company, but the North Star property is idle.—C. N. Gerry, U. S. Geological Survey.

The Genesis of Quartz in Veins

By GEORGE J. BANCROFT

In discussing theories pertaining to the genesis of ore deposits, I have learned from experience and observation that one may set forth a hypothesis with every assurance that it is novel only to learn eventually that it is almost as old as the deposits discussed. So in writing the following, I do it simply because I, in my limited reading, do not happen to have seen these ideas discussed in print.

I have noticed several articles lately in which quartz was spoken of as having been 'deposited'. Now my observations have led me to believe that the quartz in veins is mostly residual, and that very little of it was deposited, except under the conditions hereinafter discussed. I have noticed that quartz is abundant in country-rock that contains much silica and rare in country-rock that contains little silica. Examples along this line are so numerous that I cannot believe that the matter has escaped previous discussion, and yet, as said above, it has escaped my reading.

Consider Leadville, for example. The orebodies in the pure limestone contain very little quartz, in the sandy limestone and the porphyries they contain considerable quartz, while in the quartzite they are nearly pure quartz.

At Central City, Colorado, the country-rock is pre-Cambrian schist and gneiss. Wide zones of mica-schist are recognized as unfavorable for extensive quartz lodes, while the more silicious gneiss is recognized as favorable.

At Bisbee, Arizona, there is relatively little quartz on the limestone side of the contact and relatively much quartz on the porphyry side.

The Stratton's Independence vein at Cripple Creek had a prominent quartz outcrop in the granite (silica 72%), but no outcrop at all in the andesite (silica 59%).

In the Neglected mine, in the La Plata mountains, Colorado, the vein traverses alternate beds of sandstone and porphyry. In the sandstone there is much quartz and but little ore, whereas in the less silicious porphyry, there is little quartz and there may be considerable ore. The same thing is true in the May Day mine.

Examples might be continued indefinitely, but my readers can think of them as fast as I. Broadly speaking, I think it will be admitted that orebodies in pure limestone or other non-silicious rocks are apt to be almost destitute of quartz, and that, to a certain extent, the more silicious the country-rock, the more quartzose will be the veins.

It is, however, noticeable that granite or other rocks in which the silica is partly in large quartz grains seem to run to extensive masses of quartz whereas in an equally silicious eruptive, such as rhyolite, where the silica is mostly combined in silicates or occurs in minute quartz grains, there is less likely to be extensive develop-

ment of quartz. Witness the pronounced quartz veins in granite at Coolgardie, in Western Australia, at Buffalo Hump and Rocky Bar, in Idaho, and at Cornucopia, Oregon, compared to minor quartz developments in the rhyolite areas of Nevada.

In several localities where veins pass through stratified formations, I have noticed that quartz will extend upward from a silicious bed a little way into a non-silicious bed, say twenty feet or so. This indicates to me that even such quartz as may be taken into solution does not migrate very far.

From a large number of observations, of which unfortunately I have few notes, it appears to me that convincing evidence is presented showing that primary mineral solutions decompose the feldspar, mica, hornblende, etc., but disturb the pure quartz grains not at all. The silica from the decomposed silicates does not seem to travel far before it lodges or crystallizes out. The silica that comes with the solution from its ultimate source seems to be of relatively small volume, except as hereinafter discussed.

There is another feature that I have noticed and know that many others have noticed, namely, that white mica, or sericite, is the last of the original or metamorphosed rock-materials to decompose and yield its place to quartz. Furthermore, it is noticeable that quartz having a little included feldspar or mica is seldom valuable as ore. There are many exceptions to this rule, of course, but still I think it is safe to say it is a rule. Along the same line C. F. Tolman, Professor in Stanford University, tells me that many quartz veins carry their value in thin veinlets of younger quartz, encrusting the grains of the older quartz. This fact has been established by microscopic examination of a large number of specimens gathered all over the West, but particularly along the Mother Lode of California.

These two observations suggest that in many veins the major quartz development takes place prior to the metal enrichment and that metal enrichment is often attendant upon a re-opening of a quartz vein; in other words, the important action from an economic standpoint is the last action of all, and is accompanied by the elimination of the last traces of mica and feldspar from the quartz. I believe that J. F. Kemp, Professor in Columbia University, has called attention to the fact that metal enrichment was often the last act of the series that produced orebodies, but he reached these conclusions from the study of other phenomena than those herewith presented.

If then my observations are correct, the solutions or gases that form orebodies are such as do not carry and have not dissolved silica to any great extent, and that

either do not carry metal values until the latter part of their cycle of operations or do not encounter conditions favorable for precipitation of metals until the latter part of their cycle of operations. It is apparent, of course, that these observations, even if entirely free from error, do not take us much nearer the solution of the problem of the genesis of ore deposits; at most, they may give us a new angle of insight and by the slow accumulation of such new observations we may eventually learn what the chemical nature of mineralizing solutions really is, and what chemical, electro-chemical, or thermo-chemical reactions take place in the process of ore genesis.

In referring to white mica, it is recognized, of course, that the original crystals may have been biotite or some other silicate and that one of the first actions of the mineralizers may have been that of sericitization or propylitization, either of which, as I understand them, involves the removal or pyritization of the iron of the biotite and the re-crystallizing of the mica in a white and somewhat aqueous mica form, which may be sericite, margarodite, hydrophilite, damourite, or sterlingite.

In suggesting that quartz is mostly of local origin, I refer to orebodies that have been effected by migrating solutions or mineralizers. Orebodies formed by the process now recognized under the term 'magmatic segregation' contain much quartz that evidently is not 'residual'. It has been 'deposited', if I may misuse that term. At any rate, the quartz has evidently assembled from somewhere. One often finds, in orebodies of magmatic segregation, enormous masses of very silicious ore in a magma that is very low in silica.

L. D. Ricketts, in a personal letter, has called my attention to this fact and pointed out that the silicification sometimes extends beyond the magma into adjacent country-rock. He says: "For instance, in Cananea there is a contact between limestones that were once quite pure and eruptive rocks. These limestones have become highly silicified and converted into basic garnets that smelt nicely, and while they carry an excess of iron and alumina, they also contain from 20 to 30% of silica. At Puertecitos, I do not know what the original limestones were like, but the ore deposits there are of highly silicified limestone that contain an excess of silica over lime and iron."

It may be that the process of magmatic segregation is not distinctly different from the process involved in vein enrichment. We can conceive, for instance, of an emigration of mineralizers from and through a molten magma, which mineralizers discharged minerals en route according to varying degrees of pressure, temperature, and other conditions. In the immediate vicinity of the magma, where we may assume the temperature and pressure were high, there was considerable ability to move silica, but as temperature and pressure lessened this ability was lost.

After all, the ease of making and re-making theories of ore genesis only serves to emphasize the conclusion that we are hedged about with relatively few facts. The important thing to keep in view seems to be the perfectly enormous void of that which we do not know, rather

than the little amount that we do know; but it is also important to keep adding to this little amount every fact which it is possible to gather. It is in this spirit that I offer the above.

UNTIL 1917 the only manganese deposits in South Africa to which any attention had been paid were contained in certain fissure veins in the Cape Province and in the Transvaal. During the past two years more attention has been given to the deposits of this ore, and from investigations it was ascertained that manganese ores exist in the Union in three main classes of deposits, namely: (a) Fissure veins and lateroid enrichments on the outcrop of such veins; (b) connected with the dolomites and Moodies series; (c) lateroidal deposits derived from dolomites. The most important deposits of manganese ore are the lateroidal deposits associated with the dolomite in the Krugersdorp district in the Transvaal. The ore in this district occurs chiefly as dioxide in the form of pyrolusite or psilomelane, and is evidently a replacement mineral. The workings cover an area of about three-quarters of a mile by half a mile, and consist of shallow pits sunk at intervals of a few feet, placed in more or less regular lines throughout the area. The areas in the Transvaal and Bechuanaland, where the dolomites lie almost horizontally and have suffered from intense denudation, are said to be extensive. Part of the manganese ore produced has been used in the cyanide works of the Rand gold mines, but with the development of an iron-smelting industry in the Union the local demand for manganese ores will be stimulated.

ELECTROLYTIC PRECIPITATION of gold and silver from cyanide solutions would seem, on the face of it, not to offer any great difficulty, since the electro-plating of gold and silver is a well-developed art. But, as a matter of fact, a great many practical difficulties develop, because the solutions resulting from the cyanide treatment of ores are a rather complex mixture of salts, and no really satisfactory substance has been found for the insoluble anode that must be used. The precipitation of these metals by the use of zinc shavings or dust is so relatively simple that their electro-deposition has never come into general use, although a patent for such a process was issued twenty years before the McArthur and Forrest patent on the cyanide process of gold recovery appeared. Nevertheless, a number of processes for this purpose have been patented. At intervals over a period of twenty years Prof. Christy studied the problem, taking out a patent for a process of his own in 1900. Like the other patented processes it never came into general use, but in the course of his investigations Prof. Christy performed an enormous amount of experimental work, which is recorded in a monograph. This careful record of experiments covering all phases of the subject under investigation is of great value for reference for investigators in the field of electrolytic deposition of metals, and can be obtained from the Superintendent of Documents, Government Printing Office, Washington, D. C., for twenty-five cents.

REVIEW OF MINING

ARIZONA

DOUGLAS, BISBEE, TOMBSTONE, COURTLAND, MIDDLEMARCH.

DOUGLAS.—The movement of copper stored at the Copper Queen smelter since last winter has begun and it is now going to the Eastern refiners at the rate of two carloads daily. This is the most encouraging sign, locally, of betterment in the copper situation. There is nothing to indicate that smelter production will show an increase in September over the August production.

BISBEE.—What promises to be one of the biggest discoveries in the Warren mining district was made recently in the Night Hawk mine on Phelps Dodge property, operated under lease by the Night Hawk Leasing company. At last reports the 650-ft. drift was in a full face of ore carrying cuprite and chalcocite in large streaks that will average better than 50%, while the main body assays approximately 10%. The ore is of the same character, although showing some enrichment, as that encountered on the 450-ft. level and followed down from that level in a winze. The orebody was encountered 160 ft. from the shaft on the 650-ft. level. If development bears out indications this will be one of the largest, if not the largest body of high-grade ore ever found in this district. The Night Hawk lease still has four and a half years to run. James Z. McKenna is superintendent of the property.

Adjoining the Night Hawk is the Boras lease, which is starting a drift on the 400-ft. level to test a body of copper ore, much of which runs as high as 40%, which was struck recently on the 300-ft. level. Some high-grade silicates, carrying a high gold and silver tenor, also was encountered on the 300-ft. level. Five carloads of this ore have been shipped from the pocket. The main shaft of the property has just been sunk 100 ft. from the 300-ft. to the 400-ft. level, by J. A. Roper, under contract. Mr. Roper made something of a record for this district, putting the shaft down the 100 ft. in 19 days. His contract price was \$25 per ft. The Boras has been working for two years. It has but 18 stockholders, all Bisbee men. At the head of the company is E. A. Tovrea as president, while L. R. Bailey, postmaster of Bisbee, is vice-president, and John J. Bowen, secretary-treasurer. N. J. Elsing, a mining engineer who recently became interested in the property, is directing operations. Considerable ore has been shipped to the Copper Queen smelter at Douglas during the life of the property and it has been announced that shipments will be resumed in the near future.

In the same district the White Tailed Deer mine of the Phelps Dodge Corporation, and the Wolverine-Arizona company are reported to be developing good orebodies.

Lieut. Col. John C. Greenway, who recently resumed his position as general manager of the Calumet & Arizona and New Cornelia properties, has received the Cross of the Legion of Honor, awarded him by the French government for valor. Colonel Greenway went to France as a major of engineers, but later was transferred to the 101st infantry with which he fought at St. Mihiel and in the Argonne. In the latter engagement he was severely gassed and, since his return to Arizona last spring, he has been recuperating, only recently regaining his health sufficiently to resume his duties with the companies he represents.

TOMBSTONE.—August was a record-breaking month with the lessees operating here, as more than 80 carloads, mostly silver ore, was shipped to the smelters. This exceeds the records of the last fifteen years, according to J. N. Gaines, secretary for the the Cochise County Taxpayers Association. Indications point to September witnessing an even greater output from Tombstone properties. Practically all of this ore will come from leases, as the number of men working on 'company time' in the Phelps Dodge holdings is relatively small. Some time ago it was reported that the Phelps Dodge people were to re-open their mines here on a large scale, but inquiry developed the falsity of this rumor. However, so many leases have been acquired from the Phelps Dodge interest that the effect is much the same as though the company itself was at work. The old camp is being rejuvenated rapidly. Another camp which is showing signs of activity after several decades of slumber is Charleston, the first boom silver town and smelter city of Cochise county. Several properties carrying silver ore in quantity are being worked in a small way. With a silver market above one dollar, it is not hard to predict a general re-opening of old mines forgotten since the early '90's when silver slumped so badly.

COURTLAND.—Mining activity is increasing here and about 60 men now are employed in the camp, including employees of the Great Western Mining Co. and leases on ground belonging to the Leadville company. Some of the lessees are said to be doing exceptionally well. Approximately two carloads of ore are sent from here daily to the C. & A. smelter at Douglas. The Great Western is making regular shipments from a surface shaft at a point where ore was encountered two years ago in diamond-drilling work. Machinery has been installed for the purpose of sinking a three-compartment shaft in order to develop this orebody, which appears to be a large one.

MIDDLEMARCH.—The Middlemarch copper mine has been forced to suspend operations, pending repairs to

machinery, damaged by alleged sabotage growing out of a strike. Approximately five weeks ago the miners went on strike after the company had refused to meet their demands. A few days ago officials of the company attempted to start up the machinery only to find that bearings and other delicate adjustments had been treated with a liberal application of carborundum and badly damaged. Blame for this is attached by company officials to transients who were working at the mine at the time the strike began and no suspicion attaches to the main body of the men, many of whom have been with the company over a long period of years.

CALIFORNIA

NEVADA COUNTY, GRASS VALLEY, SIERRA COUNTY.

NEVADA COUNTY.—The Champion Mining Co. has petitioned the Railroad Commission for a reduction of its water rate paid to the Excelsior Water & Mining Co., the basis of the petition arising from the fact that the water is returned to the ditch and again sold for irrigation. The mine is paying nearly \$400 per month for water power. John Bath, a prospector, has taken a bond on the Ross ranch at Newtown, where he recently made a discovery of a vein from 12 to 15 inches wide showing visible gold. An important discovery has been made in a raise from a tunnel on the Crackerjack quartz mine at the head of New York canyon in the Moore Flat region. Some of the quartz contains visible gold in spectacular quantities. The mine is owned by the Buck brothers of Orleans Flat. A small crew has been at work on the South Star quartz mine all summer with encouraging prospects. The Dulmaine-Normandie property has been taken over by a Los Angeles company and development work has been in progress a short time.

The Delhi mine near Columbia was sold by the sheriff to satisfy a judgment of \$39,289 and was purchased by Louis Nonnenmann of San Francisco for \$20,000, he being the only bidder. The Delhi has been a producer but for a few years has been entirely idle. A. A. Codd of Reno, Nevada, has a bond on it and adjoining properties incorporated under the title of the St. Gothard Gold Mining Co., but whether the latter company proposes to rehabilitate the old Delhi is not known.

GRASS VALLEY.—In the case of the Golden Center Mining Co. v. the City of Grass Valley, the statement has been made that the city did not desire to obtain the mineral rights of the mining company, but merely wished to protect the townsite patent. It is stated that this is only an excuse that has no foundation in law, and that the real reason for the suit is the opposition of some influential residents of the city who object to mining operations encroaching upon the residential districts. It is also feared that in case of a final decision in favor of the mining company other locations would be made on mineral lands within the city limits. The mining companies generally are operating on the outskirts of the original townsite, but many of the veins are believed to extend under the city with depth.

SIERRA COUNTY.—Hugh McCormick is at work on the

old Arizona tunnel, at the head of Jim Crow canyon. The tunnel was driven years ago, but gravel was never uncovered. The present intention is to put up a raise much nearer the entrance on the theory that the tunnel and old raises are beyond the channel.

COLORADO

CRIPPLE CREEK, LEADVILLE, LA PLATA, OURAY.

CRIPPLE CREEK.—Sinking has been resumed by the Acacia company at the South Burns shaft, on Bull hill, and will be continued to a depth of 1150 ft. A milling grade of ore is under development in the 1450-ft. level and shipments are moving to the Golden Cycle company's plant at Colorado Springs. A rich gold discovery has been made by F. M. Kurie, former superintendent of the Portland company, now operating on the Bull Hill group of the Stratton estate, under lease. Working through the Star of Bethlehem shaft Kurie has cut into a rich shoot at the junction of the Eagles and Shurtloff veins at a depth of 150 ft. from surface. The Hoosier mine on Tenderfoot hill, owned by the Grafton Gold Mining Co., is under examination for Grant Robinson of Denver and associates holding an option to lease. The Hoosier has produced in the neighborhood of \$500,000 gross, but has lain idle a long time.

Cresson stockholders have been advised that regular monthly dividend payments will for the present be discontinued and payments made only as financial conditions permit. The Caley mill on the Jerry Johnson property on Ironclad hill is being dismantled. The plant at no time operated at a profit and the machinery has been sold to the Morse Bros. Machinery company of Denver. The Portland company reports another rich discovery south of No. 2 shaft in Independence territory at a depth of 2100 ft. The shoot has not been developed sufficiently to determine its extent.

LEADVILLE.—Sam Doran and associates, operating the Hill-top on the Summit of Mosquito pass, have opened and are now developing a large orebody carrying silver and lead. The ore has been cross-cut by adit for 150 ft. and by raise, the ore continuing in each direction, vertically and laterally, as far as the exploration has advanced. The old aerial tram on the property is now being overhauled and the railroad spur running into Levick, the shipping point, is under repair, and shipments will commence as soon as cars can be sent in. It is estimated that 100 men can be put to work on the orebody as soon as stoping is ordered. The discovery is pronounced the most important in the Leadville district since the discovery of the lead-silver orebodies on the Mikado and Penrose mines. The Bull's Eye lease on the property of the Silver Mountain Mining Co., operated by Alfred Swanson and associates, is again mining silver-iron ore. A contract has been secured for delivery of 500 tons to the Pueblo smelter. The Shamus O'Brien on Yankee hill, a zinc producer, and the Seneca lease in the same region are again operating. Electric hoisting plants have been installed on both properties and extensive development planned. New machinery is under installa-

tion in the Leadville District mill, W. S. Brooks, manager. The mill will treat the low-grade sulphide ores of the district by a new process.

LA PLATA.—A large amount of development is under way, and the balance of the present season will probably be spent in getting the various properties of the district into shipping condition next year. Geo. W. Gilmore &

A GLIMPSE OF THE SAN JUAN

Co. are developing the Jumbo extensively and have shipped several cars of ore. Most of the value of the ore is in gold and silver, with occasionally some lead. Heavy production is expected upon completion of driving operations this fall. Although work on the Jumbo is on the larger scale, work on the Idaho and the Idaho dump is being carried on. The dump is under lease to Brandiger & Hobson. Hutchinson & Co. have leased the Southern Boy lode to Costly & Akins, who have opened a pocket of high-grade ore, which brought returns of \$200 per ton when packed to the smelter. A company of Kansas men is becoming interested in the Puzzle Group, and the property will probably be developed with a view to shipping the ore in quantity. The Lewis Mountain M. & M. Co. continues to develop the Ten Broeck, and the property is being rapidly put into condition as a producer. The 2800-ft. adit, which has been under way for the past three

years, is nearing completion, cutting the vein system of the Ten Broeck in such a way as to permit extensive operations. The Lewis Mountain M. & M. Co. has attained greater depths than ever before attained in the La Platas, 2200 ft., at a great expenditure of money, but returns seem assured, as the ore is reported to assay \$60 per ton. Blunt and partners are operating the Little Nona under lease, and the driving of a 60-ft. tunnel is almost completed, cutting the vein at the Jumbo-Nona intersection. Minoletti & Co. are working the Mountain Meadow and other properties of P. W. Pittman at the head of Junction creek. The Tomahawk mine, owned by T. J. Kelley, has been leased to a company of local men, who are developing the property and shipping ore. The Small Hope is under lease to local interests, who are shipping ore. The Little La Plata, owned by the estate of Wahl Bros., is under lease to Little & Carigan, who are working over the dump, and shipping ore. Basil Caramouziz has leased the Eagle Pass Mining Co. holdings and is shipping ore.

CAVE BASIN.—Yingling and partners continue to open up the Excelsior claim. A new company has been organized to develop the Colorado group, where good assays in silver and copper are reported. The property covers 240 acres of land in a lime formation. The ore will be hauled 25 miles to the Durango smelter. The road is good to within 2½ miles of the property, and this distance will be bridged at an early date.

OURAY.—The Chipeta Mining, Milling & Smelting Co., organized in June 1918, is now fully capitalized. The principal work of the new company will be operating the Bachelor Khedive, but a number of construction jobs are necessary before mining will be undertaken. A building will be put up to house the motor, compressor, and hoist, and a small house for a gas-engine. Driving along the Khedive vein to a point in the Old Maid shaft, a drive of 500 ft. to cut the Oak Street vein will then be started. As a convenience to the miners, pay day will be established twice a month, on the 5th and 20th. A large surface body of heavy lead ore was discovered on the Toledo group, running for 600 ft., and 3 ft. wide, carrying from 40 to 53% in lead, with 10 to 20 oz. in silver. A strongly capitalized company has been organized to open the property and a mill is under consideration. The various mines of the districts are showing more activity than for the past three years, and the developments under way augur well for a busy and prosperous season during 1920. A deal that has been pending for several years was consummated when the American Smelting & Refining Co. took over the Revenue mine under a bond and lease by which \$100,000 is to be expended during the next 18 months on developing the old producer. The fact that such a large investment is contemplated by the A. S. & R. Co. has reassured the mining interests of the district. The Calliope dumps are being worked over by Jesse Steel, under a lease from the Nix interests. The run of ore is generally good, carrying 12 oz. in silver and two cars have already been shipped to the smelter at Durango. The Camp Bird tax case is interesting to mining people generally, as it sets a prece-

dent for taxation of idle properties. The Camp Bird company contested the assessment on the valuation of \$400 per acre applied by the county assessor, and suit was brought before the District Court, and the case was heard before Judge T. J. Black, sitting at Montrose. A verdict was returned favoring the Camp Bird, the assessed valuation being placed at \$21 per acre, which was the valuation of the Barstow property, the nearest non-producing mine. Upon further discussion, the county and the Camp Bird agreed upon a valuation of \$60 per acre, and the case will not be appealed. The raise to provide better ventilation is nearly completed, and mining and milling may be resumed about October 1.

RED MOUNTAIN.—There is noticeable activity in the district, the recent discovery at the Barstow having given added incentive to the development operations now under way. The railroad is in poor condition from the Joker tunnel to Genesee, so that much of the ore has to be hauled for a few miles to make rail connections. A number of old producers are being reopened, including the Robert Bonner mine, near Burro Bridge, where good orebodies are reported, and the Radiant Mining Co., which is opening the old Ruby group of claims, and now shipping in small quantities. Mill construction now under way affords an added indication of future prosperity for the district. The Tom Crawford mill at Ironton is nearly completed. The Summit company has approved plans for a new mill near the portal of Koehler tunnel, providing for ten stamps, table concentration, and flotation units. The capacity will be 100 tons. The construction work is under Charles McMillen, and will be started as soon as the railroad is serviceable. A short stretch of road will be constructed from the mill to Sheridan Junction on the Red Mountain branch of the railroad. There will not be any heavy production during the present year, but the outlook for the ensuing year is favorable. The Boston company has leased its property at Ironton to Canavan & Co., who are starting operations by repairing the tunnel for a distance of 65 ft. After the tunnel is in proper condition, there will be a drift for 250 ft. on each side of the intersection of the vein. The cross-cut will be continued for a distance of 150 ft. in order to cut the main lode.

The Barstow operations under Lundberg & Curtis, lessees, continue to show favorable returns. A short run of low-grade ore followed the recent discovery, and then a vein of high-grade ore was encountered. The vein is from 1 to 3 ft. wide, continuing for a distance of 35 ft. The recent discovery of high-grade made up four cars of ore shipped to the smelter at Durango, and is reported to have brought the fortunate operators net returns of approximately \$7000 per car. The Ouray Consolidated company has opened some fine orebodies on the Guadalupe, and continuous running during the winter months is expected. A new bunk-house is under construction, dimensions 18 by 51 ft., and is to be completed this fall. The Guadalupe is to be connected to the Tom Crawford mill by a two-bucket tram, 3500 ft. in length, permitting the moving of the ore from the working tunnel to the

mill at a low cost. The most interesting development in the district is the recent survey of the entire workings of the Red Mountain Mines Co. holdings by the Smuggler Union Mining Co., which has had a corps of expert engineers and geologists making an exhaustive examination of the property with a view to development. Should their opinion be favorable to purchasing, there is no doubt that the Red Mountain district will assume its old place as one of the leading producers in Colorado. The Yankee Girl workings were unwatered this season, permitting an examination of the deep orebodies. The machinery of the Guston mine has been sold to the Sackett foundry of Telluride. Much of the machinery is in excellent condition, notwithstanding long disuse and exposure. Some equipment will have to be recovered from the lower workings, and will be removed with great difficulty. Operations on the Congress mine have been resumed by King, Lovingood & Co. Giono & Co. are again shipping from the Congress dumps. P. Walker has resumed operations on the Kansas City mine, and will probably ship a few cars this season. E. W. Creel will reopen the Wyoming mine, having some fine zinc orebodies in sight and a good showing of high-grade silver ore.

NEVADA

STRIKE AT TONOPAH NOT SETTLED.—GENERAL NEWS.

GOLDFIELD.—In a drift 425 ft. south from the shaft the Red Hill Florence has opened ore. No statement has been made by the management regarding the find and it is probably what would be regarded as unimportant if made elsewhere in the district. The face of this drift is far south of the Florence fault, beyond which ore has never been found except in small lenses, and the discovery of an orebody would result in the re-opening of the entire southern part of the district, which has been inactive for many years. It is planned to continue the drift for a total distance of 800 ft. to reach under a group of red hills from which the company takes its name. This drift, on the 500-ft. level, was driven 250 ft. by a former management. The Red Hill has secured by lease a narrow strip along the western side-line of the Florence and a drift is being driven south in this ground to prospect numerous small seams. The Florence Divide lease on the Florence Goldfield has sacked 1000 lb. of ore estimated to be worth \$7 per pound from the newly discovered hanging-wall seam. The last carload of ore shipped was estimated by the Florence company to be worth \$365 per ton. This was the nineteenth carload shipped from the lease since it was taken over by the Florence Divide. The eighteenth assayed \$134 per ton. The west cross-cut being driven by the Florence company is 180 ft. long. Seams assaying from 80c. to \$2 are being cut. A carload of ore assaying from \$40 to \$50 is being loaded by the Delcie lease on the old Wheeler block.

TONOPAH AND DIVIDE.—After apparently having brought the Tonopah-Divide strike to an end by securing a 6 to 1 vote for the workers to resume, Governor Boyle has left Tonopah, with conditions, according to general

opinion, in almost a hopeless state. After the vote had been taken it was found that practically none of the underground men had cast ballots and the mines were unable to reopen. The governor is now in San Francisco and will return to Tonopah in a few days to reopen negotiations, which are being conducted between the State and the workers, the operators having withdrawn their representatives.

A drift from the bottom of a 60-ft. shaft on the West Divide has penetrated 36 ft. of silver ore. For the first 18 ft. from the shaft the shoot is from a few inches to $2\frac{1}{2}$ ft. wide and assays 100 oz. The second 18 ft. is from $2\frac{1}{2}$ to $3\frac{1}{2}$ ft. wide and assays 75 oz. With this ore is a seam from 1 to 3 in. wide that assays from 1000 to 1500 ounces.

Tonopah men are becoming interested in the Birch

the mines with electric power, has a generating plant on the canal, from which the ranchers at Fernley are drawing heavily for irrigation purposes. The Western Ore Purchasing Co. sampler at Hazen is operating entirely at night, when the power requirements of the farming districts are light.

EUREKA.—Veins of ore containing 20% copper have been found in the bottom of the 250-ft. winze from the 400-ft. level of the Croesus-Eureka, far above the water-level. The winze orebody, opened at 200 ft., is 25 ft. wide at 250 ft. and the average content for this width is 0.4 oz. gold, 20% copper, 110 oz. silver, and 75% lead. This work is being done 1000 ft. south of the early-day workings and in territory heretofore unexplored. North of the winze on the 400-ft. level a drift from the east cross-cut at this point has exposed a full face of ore that

THE TONOPAH DIVIDE MINE

creek gold discovery, 10 miles south-east of Austin and in Smoky valley. According to men who have been to Birch creek, the vein in which the original discovery was made by John Cahill has been cross-cut for 50 ft., narrow seams of ore assaying from \$10,000 to \$50,000 being exposed in rhyolite. The foot-wall of the vein is lime and the hanging wall is monzonite. The district has been named Telluride.

PIOCHE.—The shaft of the Prince Consolidated at Pioche, now 400 ft. deep, is to be sunk an additional 500 ft. to open an orebody discovered in drilling and may be sunk to 1300 ft. to open a second vein found in drilling. New surface equipment for the work has been ordered. The drill penetrated the first vein for 10 ft. and the second for 11 ft. The first contained 25 oz. silver and \$3 in gold. The second contained 30% zinc. The Prince is shipping 2000 tons of lead-silver ore to the Salt Lake smelters weekly.

ROCHESTER.—The Rochester Nevada, the Nevada Packard, and the Mill City tungsten mines and mills are closed because of a shortage of water in the canals at Lahontan. The Nevada Valleys Power Co., supplying

assays 0.2 oz. gold, 100 oz. silver, and 70% lead. New and more powerful surface machinery, including a 12-drill compressor, is being erected. Ore shipments are being made at a rate of 60 tons per day. Adjoining the Croesus-Eureka on the south is the Peerless, under the same management, in which a large body of ore assaying from \$25 to \$30 per ton has been opened on the 200-ft. level. Shoots of rich ore, some assaying as high as \$4000 per ton, have been found in a winze sunk from this level. Shipments of high-grade ore are soon to be started from the 400-ft. level.

WISCONSIN

PLATTEVILLE, CUBA CITY, AND LINDEN.

PLATTEVILLE.—The Vinegar Hill Zinc Co. is engaged in an extensive exploration program in Lafayette county. Drill squads have obtained encouraging results on the Coulthard tract, east of the Crawhall and Thompson mines, profitably operated for years by the Fields Mining & Milling Co. The log warrants the early development of another zinc-ore producer. Drills at work for the same company on the Buxton-Sherry-Pedely tracts east

of the Patsy Drumm mine, at Leadmine, have obtained satisfactory results. Shaft-sinking is well along at Copeland, near Shullsburg. Extensive exploration work has been well started on the Wm. Fields land at New Diggings. The Wisconsin Zinc Co., subsidiary of the American Zinc & Lead Smelting Co., in addition to a vigorous production campaign for its mines in this field, is extensively engaged with drill squads on the David Booty tract, adjoining the Winskill mine, a one-time heavy producer of medium-grade zinc concentrate. Results to date invite early shaft development. The Edge farm, of 600 acres, at New Diggings, and the Bushnell farm, east of the city of Platteville, have been secured and exploration by drilling will be started without delay.

CUBA CITY.—The Big Bend Mining Co. has been incorporated with a capital of 60,000 shares, at a par value of \$1 per share. The new company owns valuable leaseholds on mineral ranges in this district, which it is proposed to prove by drilling before mine development is undertaken. The Zinc Hill Mining Co., operating the Big Dick mine, began milling with a new 300-ton concentrator September 1. A deposit of low-grade zinc-ore has been proved by drilling. Shipments of both zinc ore and lead ore have been made and the mine gives promise of heavy yield. Charles Wolf, president and general manager of the Zinc Hill, offered \$50,000 for 70 acres of land contiguous to the mine-site, on which it is proposed to erect a large electro-static zinc-ore separating plant. The offices of the Zinc Hill Mining Co. are at Platteville. Thorne, Fox, and others, local mining men, have obtained the mining rights to the Pacquette leasehold, in Shullsburg township, and a new concentrator is being rushed to completion. The ground has been proved by drilling and a shaft has been sunk to ore. H. S. Snow, general traffic manager of the American Zinc Co., inspected the mining properties of the Wisconsin Zinc Co. at New Diggings the early part of this month. Mr. Snow was formerly general manager of the Wisconsin Zinc Co. in the Wisconsin field.

LINDEN.—David MacKay and other Milwaukee capitalists have purchased the mining equipment and mining rights of the Ross Bros. Mining Co. Ross Bros. have mined successfully for 12 years and now retire from further active connection with their mining lands. Some discoveries have been made by drilling on the Jeffrey tract, east of the old Ross mine. The Ross mill will be transferred to the new mine-site. A new 150-ton zinc mill is being built on the Optimo mine No. 4. The Bid-dick mine will be opened again on September 22. It is a low-grade zinc producer. The Vinegar Hill Zinc Co. has a new 200-ton mill ready for service on the Dale mine at Livingston. Three distinct ranges have been drilled, two of which converge at the Yewdall plant owned and operated by this company. To the west of the Yewdall mine and mill a new shaft is in ore at 140 ft., a quarter of a mile distant. A surface tramway is being installed and the ore will be milled at the Yewdall. The ranges as now proved extend east and west a distance of one mile. The two mills, it is stated, will yield a daily output of 100 tons of 30% zinc concentrate. Dr. Charles Ross,

owner of the Ross farm of 370 acres, has expended \$15,000 for exploration work on his land on what is known as Crow Branch, south-west of Livingston, and declared by State geologists to afford one of the most inviting zinc-bearing areas in the field. A shaft is down over 100 ft., bottomed at 130 ft. to connect with the ore-level.

BRITISH COLUMBIA

ALICE ARM, NELSON, SALMON RIVER.

ALICE ARM.—The Taylor Engineering Co. is planning the erection of a 3000-ton ore-bunker at the wharf at Alice Arm to facilitate shipping. The railway is transporting 150 tons of ore per day from the Dolly Varden mines to tidewater. The Sweetwater claim, across the river from the Dolly Varden, has been purchased by D. J. Hancock, who is interested in a number of other claims in the district. Mr. Hancock recently announced that all right, title, and interest in the United Metals Co. had been sold to him for \$25,000 and that the only interest the stockholders have remaining is the division of such moneys as has been and is to be paid by him on the property. The La Rose mine is taking out some good silver ore, two shipments having been made, one to Anyox and the other to the Trail smelter. Samples taken from the Climax claim are reported to have assayed high in silver, while rich ore of the same character is said to have been taken from the North Star mine.

NELSON.—With further reference to the Eureka mine it is announced by H. H. Vincent, president of the Vincent Development Co., which is handling the development of the combined Eureka-Granite-Poorman property for the Inland Mining Co., that the surveying of the 6000-ft. extension of the tramway has been completed and that a contract for its construction will be awarded immediately. Mr. Vincent has inspected the work at the mines recently and reports that a car of concentrate is ready for shipment to the Trail smelter. He says that it is much cleaner and better than that shipped in August, owing to the tuning-up of the Granite-Poorman mill and to other improvements effected in the interval.

SALMON RIVER.—The discoveries of rich silver ore have attracted a number of prospectors to the Salmon River district this summer, and a considerable quantity of fresh ground has been staked. Some good silver ore has been found on the Nass River side of the divide and several locations have been made there. A considerable amount of fresh ground has been staked, too, north of the Yellowstone group. Patrick McBride and A. W. Balzimar have found some excellent ore across the glacier from the Big Missouri and have staked claims there, and other prospectors are working in the same neighborhood. Some exceedingly rich ore, showing a quantity of wire silver, has been struck on the Spider group. Patrick Daly, who is in charge of the development, estimated that \$10,000 worth of ore was blown out in three rounds of shots. This property was bonded in the spring for \$30,000 by R. W. Martin, who turned the bond over to R. Wood, president of the Premier mine. R. Hanley, who is in charge of the diamond-drill operations at the Big Mis-

souri, is working three shifts, and is drilling about 50 ft. of ground per day. The Premier is preparing for a big shipment of ore during the coming winter, the returns from which, it is said, are likely to cause a mild sensation.

The Granby Consolidated company has been successful in its appeal to the Privy Council regarding the Cranberry district coal rights, on which its Cassidy collieries are situated. The case was brought by Bing Kee, a Chinaman, who had purchased the surface rights from the Ganner estate in 1905, and claimed that he purchased the coal rights at the same time. The Ganner trustees, on the other hand, claim that they applied for and obtained the coal rights after they had sold the surface rights to Kee; they subsequently sold the coal rights to the Granby company for \$45,000. There is a case pending before the Privy Council in which the Esquimaux & Nanaimo Railway Co. claim that these same coal

company's mines, of course, were heavy shippers. From the Centre Star, Rossland, came 1687 tons and from the Sullivan, Kimberley, 2720 tons. The Sullivan mine has passed the 100,000 mark for zinc-ore shipments for the current year. During this period the same mine has contributed a considerable tonnage of lead ore. A new shipper is the Silverite, of Alamo, recently taken over by Clarence Cunningham.

VANCOUVER.—A representative collection of the ores of British Columbia was shown at the Vancouver Exhibition, which took place from the 8th to the 13th of September inclusive. There were attractive samples of silver, gold, copper, zinc, magnetite, wolframite, scheelite, cinnabar, bismuth, molybdenite, etc., displayed, the whole having been assembled under the supervision of the British Columbia Chamber of Mines. The exhibit from the Kootenays, prepared by Fred A. Starkey of Nelson, was one of the most prominent. It was a first-class index of the mineral wealth of that part of the Province. The lode properties of Sheep Creek, which are being extensively developed at present, were represented by specimens which attracted much attention. There were special exhibits also from the Surf Inlet mine; the Dolly Varden mine; the Britannia Mining Co.'s properties; the Granby Consolidated Mining & Smelting Co.'s mine at Anyox and elsewhere; the Canadian Consolidated Mining & Smelting Co.'s properties; the Drum Lummon; and the Bear River, Salmon River, and Portland Canal gold, silver, and copper countries.

ONTARIO

COBALT, PORCUPINE, AND OTHER DISTRICTS.

COBALT.—Following the settlement of the strike by the acceptance by the miners of the terms proposed by the mine managers, operations were speedily resumed at most of the mines. In many cases it was necessary to de-water the lower levels which had been flooded. In a few days the Coniagas and Trethewey mines were working at capacity, while the Kerr Lake, Crown Reserve, McKinley-Darragh, and some others had started operations on the upper workings. As many of the strikers had left the district the working forces of some companies have been considerably reduced, but this is likely to be only temporary as men are coming in rapidly. It is anticipated that conditions will be nearly normal by the end of September.—The Peterson Lake has made arrangements for the treatment of 1000 tons of tailing in the mill of the Dominion Reduction Co., in order to determine the silver content and the silver recovery. The company has about 250,000 tons of this tailing. Owing to the high price of silver plans are being made for the re-opening of several old properties which have been closed for some years.

PORCUPINE.—The profits of operations at the Dome Mines are understood to be about \$250,000 per month, the mill-heads averaging \$9.80 per ton. As this is a much higher figure than the estimated average grade of the ore-reserves, which is \$5.10 per ton, the directors consider it unwise to issue official monthly statements, which might be misleading, in view of the fact that their policy

HYDRAULICKING IN BRITISH COLUMBIA

areas were granted to it, as part of its subsidy for building the line, by the Dominion government, and therefore the Provincial government had no right to grant the claims to the Ganner estate. The Granby company has developed the colliery and is turning out about 10,000 tons of coal per month, part of which is sold and part goes to the Anyox by-product coke ovens for use at the smelter.

STEWART.—Preston Locke, a mining engineer representing the American Smelting & Refining Co. at Tacoma, recently visited the Portland Canal and Salmon River districts. Mr. Locke was favorably impressed with the development in progress. He said that the Premier and the Joker already were mines and there were many good prospects.

TRAIL.—Ore receipts in gross tons for the week from September 1 to September 7, inclusive, at the smelter of the Consolidated Mining & Smelting Co., totaled 6610 tons, making the total tonnage handled to date this year 241,148. The largest independent shipper again was the Mandy, Le Pas, Manitoba, with 571 tons, while the Quilp, of Washington, was a close second with 442 tons. The

is gradually to reduce the grade of the ore treated as the milling capacity is increased. The shareholders of the Dome Lake have ratified a by-law providing for the issue of bonds to the amount of \$100,000 to raise funds for development.—At the Keora a shaft will be sunk to the high-grade orebody encountered in diamond-drilling. The Porcupine Crown has been completely dewatered and ore is being developed on the lower levels. The McIntyre, which has been taking ore of good grade from the Plenaurum property, has encountered a heavy flow of water on the 1000-ft. level which is handicapping operations. The Hollinger is making efforts to increase its staff by 500 men, but has met with but little success.

KIRKLAND LAKE.—At last accounts the strike was still on at this camp, though mine managers were endeavoring to effect a settlement. It is stated that unless an understanding is speedily arrived at the mines will remain closed until spring. When the strike occurred three mills were producing: the Lake Shore, Kirkland Lake, and Teck-Hughes. The Tough Oakes mill was to have been started this fall and the Wright Hargreaves had begun the construction of a 150-ton mill. Another mill was planned for the Ontario Kirkland. Since the strike began work has been confined to a few small prospects.

BOSTON CREEK.—This goldfield is being extended by new discoveries in Boston and Catherine townships, finds recently made in the latter being farther to the south than where gold was supposed to occur. A number of claims in this neighborhood, which were allowed to lapse, have been re-staked. The introduction of electric power, which is being brought in for the Miller Independence, is expected to give a great impetus to the mining industry. The Allied Gold Mines, which is conducting an extensive diamond-drilling campaign, has cut what is believed to be a continuation of the Miller Independence vein, and also a parallel vein of considerable width stated to carry good ore. The Peerless is sinking a shaft to the 200-ft. level. At the Campbell-Duncan claim rich ore has been encountered in a test-pit.

GOUDREAU.—The Consolidated Mining & Smelting Co. has purchased six claims of the Webb-McCarthy-Miller gold properties, near Goudreau, for \$400,000. One of the conditions of the purchase is that the company shall erect a reduction works on the property.

MEXICO

CONSTRUCTION OF CYANIDE PLANT TO BE RESUMED.—
CANANEA INCREASING OPERATIONS.

CHIHUAHUA.—Construction of the 600-ton cyanide plant by the American Smelting & Refining Co., at Minas Nuevas, in the Parral district, has been resumed. The work is being done under the direction of Bernard MacDonald, who has a force of Mexicans in his employ. The building of the plant was started early this year, but shipment of machinery was interrupted about four months ago by a raid made by a force of revolutionists under Villa, who tore up a long stretch of track on the Parral branch of the railroad. The destroyed portion of the line has just been repaired and traffic resumed. It is

stated that the recent defeat of Villa's forces in Durango may lead to the early reopening of the smelter of the American Smelting & Refining Co. at Asarco, in that State.

SONORA.—Information has been also received here that the Cananea Consolidated Copper Co. will be operating its mines and smelter at Cananea to full capacity by the end of this month. The working force was recently increased by taking on one thousand additional men. This company has suffered many interruptions during the last several years as a result of revolutionary operations. It is stated that all departments of the smelter have been overhauled and are now in prime condition for a heavy and continuous run.

Yaqui Indian bands operating to the south of Moctezuma make for uneasiness among the mining men of that district, particularly in view of the recent looting of properties. Lately, scouting parties of rancher volunteers have gone out of Moctezuma to ascertain whether or not the Indians have returned to their hill haunts or still are looting ranches. All the small villages and ranches have been deserted and not a few of the mines, the people gathering in Moctezuma and Cupmas. The Government has taken no steps toward running down the Indians. The Progreso Mining Co., whose property is situated about 10 miles north of Batuc, has started to work on a wagon road to Tepache. This road, running from Moctezuma to Suaqui, was built before the revolution but lately has fallen into such disrepair that Andrew Macfarlane, manager of the property, has had considerable difficulty in getting in a plant of machinery for development operations. The Progreso has large bodies of milling ore as well as stringers of high-grade rock. A road recently built to Hermosillo had to be abandoned by the company owing to Yaqui depredations. The road now being repaired will serve a number of mining properties in the vicinity of Suaqui, Batuc, San Pedro, Tepupa, Sahuaripa, Bacanora, and Mina Mexico.

H. J. Wendler, manager for the Buena Vista Mining Co. in the Moctezuma district, has returned from Los Angeles. Work on the company's mill, in charge of James Lord, was completed about September 1. It has been planned to sink a shaft to develop water for operation of the concentrator, but heavy rains have delayed the start on this work. A large tonnage of concentrating ore is assured and plans now are being formulated for the construction of a reverberatory matting furnace. It is probable that a cupelling furnace also will be built so that silver bullion may be taken out at the property. This will obviate shipment of concentrate and will make a big saving in freight, treatment, and other expenses. The Mina Blanca, owned by Manuel Vasquez de Nacozari, has been leased by F. Murrietta, who is working it. A large tonnage of 100-oz. silver ore has been shipped from the old dumps and the upper workings. As soon as the rainy season has ended, Mr. Murrietta plans to unwater the mine and take out higher-grade ore said to have been found in the lower levels. There also are large bodies of low-grade silver, on the lower levels, which, under the prevailing market, can be shipped at a profit.

ARIZONA

Nogales.—The Bachman-Meritt company will build a mill to treat its vanadinite ores at its Tres de Mayo mine, 12 miles east of Nogales.

Prescott.—The Tuscumbia has been taken under bond by Richard Kingdon of Jerome.——The Emporia has been acquired by J. Gardner Scott of Hollywood.——The Zero has been taken over by Eli Perkins and associates of Prescott under the new name of the N. C. 4 Mining Co, and a crew of men is at work cleaning out.——The Mark Twain, under bond to J. F. Healy, is working several men.——The Monte Cristo is being operated by W. L. Worthington, from Nacozari, and J. Hubbell, of San Francisco, opening up a new vein 8 ft. wide of good silver-gold ore.——The Hidden Treasure adjoining is being operated by Bennett, of Prescott.——The Midnight Test is operating 6 Nissen stamps under the management of Francis Clark.——There is little activity in Copper Basin, but the Zonia to the south is under bond to J. F. Healy, who is working several lessees.——The Silver King was recently bonded to people from Jerome.

In the Hillside country, the King continues to ship zinc ore, but has been hampered by the excessive rains.——It is reported that the Bagdad Copper Co. will resume operations in Copper Creek about October 1. Mr. Guysendorfer was a recent visitor to the property.

Tucson.—The Paymaster Silver-Lead Co., owner of the Paymaster mine, situated 24 miles south of Tucson, in the Olive camp, is planning to build a mill. Charles Blenman, of Tucson, is president and W. F. Hagan treasurer and manager.

CALIFORNIA

Alleghany.—The mill at the Morning Glory is being enlarged, and mine developments increased. It is stated that ore assaying \$20 to \$50 has been encountered and that the property is in excellent condition. A. A. Codd, Reno, Nevada, is manager.

Dedrick.—Work with a small crew has been resumed on the Globe quartz mine following an idleness of many months. Driving from the lower tunnel is proceeding to open promising ground. M. Elliott is manager and A. B. Cousin, foreman.

Graniteville.—Work has been resumed at the Spotswood gravel property with two shifts employed. The tunnel is undergoing repairs and re-timbering preliminary to being extended to reach the channel.

Moore's Flat.—A 6-ft. vein of high-grade gold ore has been opened in the Crackerjack by Buck brothers. The vein was tapped in a raise from the main tunnel and shows visible gold in profusion. All the ore is said to be of good milling grade, with veinlets running high in gold. Nevada City is the nearest supply point.

Redding.—The Reid mine in Old Diggings is shipping from 150 to 200 tons of ore per day to the Mammoth Copper Co. at Kennett. Fifty thousand tons of gold ore from the Reid is piled up in the smelter yards.——Diamond-drills have been set at work prospecting the copper claims of W. H. McEwen and I. O. Jillson on Oak Run, 16 miles east of

Redding. This is a camp that has lain dormant for years.

——The Atascadero Copper Co., which runs the Greenhorn copper mine near Tower House, is contemplating erecting reduction works soon. Experiments are being carried on in Oakland to determine the best method of treating the ore. A decision will be reached in about thirty days. In the meantime the company will keep on with development. Albert Hanford, of Redding, is superintendent.

MICHIGAN

The production of ingot copper from the mines of the Michigan district for the month of August was 13,302,886 lb., a decided increase over the output for July but only 70% of normal production. The outstanding features of the August showing were the increase in the production of the Calumet & Hecla of nearly a million pounds, the decided increase in the Ahmeek and Osceola mines, the exceptionally high-grade yield shown in the Champion mine of the Copper Range, as well as the increase in copper total. La Salle drops out entirely and Superior's output is practically nothing. Winona entered the list of producers for August, but had not operated long enough to get any mineral to the smelter.

The following statement gives the approximate copper produced at all the mines in the Michigan copper district. In some of the mines the figures are official smelter and mine records; in others they are estimates, but the approximations are conservative in each instance.

| | Ore | Lb. per ton | | Refined | |
|-------------------|---------|-------------|------|-----------|-----------|
| | tonnage | Aug. | July | Aug. | July |
| Ahmeek | 55,890 | 22.2 | 20.8 | 1,245,300 | 958,500 |
| Allouez | 13,600 | 18 | 14.5 | 245,800 | 150,100 |
| Baltic | 20,000 | 34 | 35 | 680,000 | 654,500 |
| Calumet & Hecla. | 165,472 | 25 | 22.4 | 4,136,818 | 3,292,821 |
| Centennial | 5,075 | 13.9 | 15 | 70,500 | 76,002 |
| Champion | 45,000 | 40 | 35 | 1,800,000 | 1,330,000 |
| Isle Royale | 58,865 | 18 | 18 | 1,059,583 | 935,150 |
| Mass Con. | 7,143 | 14 | 14 | 100,000 | 92,321 |
| Michigan | 5,000 | 32.2 | .. | 161,254 | 184,175 |
| Mohawk | 43,157 | 21.36 | 23.4 | 922,209 | 1,012,575 |
| Osceola Con. | 56,700 | 14.4 | 13 | 817,600 | 651,000 |
| Quincy | 90,000 | 18 | 18 | 1,620,000 | 1,500,000 |
| Superior | 650 | 17 | 20 | 11,000 | 35,025 |
| Victoria | 10,000 | 12.5 | 16.5 | 130,000 | 108,900 |
| Wolverine | 27,493 | 14.65 | 13.8 | 402,822 | 331,736 |

IDAHO

Coeur d'Alene.—The orebody at the Idaho Carbonate Hill Con. M. Co.'s property is reported to have widened to five feet.——Work has been resumed at the Chicago-Boston property of eight claims at Lake gulch on the south side of the Coeur d'Alene river near Wallace.——Copper King continues in ore, and a sample across 2½ ft. of the vein is reported to carry 6.9% lead, 10.5% zinc, and 3 oz. of silver.——The St. Lawrence property on the Montana side of the Coeur d'Alene divide contemplates a 2000-ft. tunnel at a cost of \$35,000. No further ore shipments are contemplated for a year.

Northern Idaho.—The Armstead Mines, operating at Talache, Idaho, on Pend Oreille lake, has decided to engage

in development for another year before beginning the construction of a concentrating mill. In the development of this property the management has so far driven a large tunnel to the 4000-ft. point, together with a raise and several cross-cuts, and has driven on the No. 3 and 2 tunnel levels. —The shoot struck recently on the 500-ft. level of the Richmond mine at Adair has been followed by a drift for more than 100 ft. The shoot is two to five feet wide and contains copper sulphides of shipping and milling grades. A streak of peacock ore six inches wide was disclosed by recent driving.

UTAH

Tintic.—Ore shipments from Tintic for the week ending September 19 were considerably increased, the total being 133 carloads, compared with 117 carloads the week before. Water troubles, which seriously interfered with the output a week ago, have been satisfactorily adjusted, thus accounting for the improvement noted. The shippers follow:

| | |
|-----------------------------|------------|
| Chief Consolidated | 35 |
| Iron Blossom | 20 |
| Dragon Consolidated | 15 |
| Tintic Standard | 12 |
| Mammoth | 7 |
| Eagle & Blue Bell..... | 7 |
| Colorado Consolidated | 6 |
| Empire Mines | 6 |
| Centennial Eureka | 5 |
| Gemini | 5 |
| Swansea Consolidated | 4 |
| Grand Central | 4 |
| Ridge & Valley..... | 4 |
| Alaska Lease | 1 |
| Victor Consolidated | 1 |
| Total | 133 |

Park City.—For the week ended September 19, Park City mines shipped a total of 3,951,730 lb. of ore, or 1976 tons, compared with 2070 tons a week ago. Of this amount Ontario shipped 710 tons, while Silver King Con. is credited with 110 tons. Shipments in pounds follow:

| | |
|----------------------------|------------------|
| | Pounds |
| Ontario Silver | 1,421,200 |
| Judge M. & S. | 1,096,420 |
| Silver King Coalition..... | 1,000,680 |
| Daly West | 213,430 |
| Silver King Con..... | 220,000 |
| Total | 8,951,730 |

BRITISH COLUMBIA

On account of the high wages already paid at Hedley, and the demand for still higher wages, and on account of the continued high cost of the supplies, I. L. Merrill, president, and G. P. Jones, superintendent, have recommended to the board of directors that the mill should be closed this fall and that the development work at the mine should be continued, using the surplus on hand for this development work, instead of for the payment of dividends. Their recommendation has been approved by the board of directors.

Nelson.—Travel by trains and boats into the Slocan mining district, usually heavy at this period of the year, is the greatest in its history. Trains and boats are crowded. The increased travel is brought about by a resumption in some of the mines and by an increased activity in mining operations generally, it is said.

KOREA

Ulsan.—The clean-up for August was \$62,500. Taracol was shut-down for 17 days because of scarcity of water, but is now in full operation again.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

W. W. Mein is in San Francisco.

W. M. Brewer has returned to Vancouver.

George W. Goodchild is here from London.

J. N. D. Gray has returned from Scotland to Los Angeles.

T. A. Rickard has returned from the Coeur d'Alene, Idaho.

Gilmour E. Brown has gone to Balloch, Dumbartonshire, Scotland.

Preston Locke has been at Stewart in the interest of the A. S. & R. Co.

G. L. Sheldon of Denver was in Chaffee county, Colorado, in early September.

H. C. Colburn has returned to San Francisco from a business trip to Colorado.

Sergio Bagnara passed through San Francisco last week on his way to New York.

W. W. Wishon, of Searchlight, Nevada, is in the Caribou district, British Columbia.

I. F. Aguilar Revoredo has opened an office as consulting mining engineer at Casillo 176, Oruro, Bolivia.

J. J. O'Neill, who has been making geological examinations in the Stewart district, has returned to Ottawa.

Alpheus F. Williams, general manager for the DeBeers Consolidated Mines in South Africa, is in San Francisco.

Carl Tombo, of Philadelphia, and Burr Evans, of Placerville, were examining mines in El Dorado county this month.

W. S. McCann, who has been making geological examinations in the Lilloet district, passed through Victoria on his way to Ottawa.

Herbert H. Roe, after a short visit to London and France, sailed from Liverpool on the 'Celtic' for New York, on his way to California.

C. M. Eye, formerly superintendent for the Benguet Consolidated Mining Co. of Benguet, P. I., and now States representative for that company, is at the Hotel Stewart, San Francisco.

Obituary

H. A. J. Wilkens, of Wilkens & Devereux, New York, died on September 13 in Colorado.

Henry B. Underhill, Jr., who died on September 14, was first employed by Thomas H. Selby (at one time Mayor of San Francisco) in 1866. The original firm, the San Francisco Assaying & Refining Company, was bought out by Kellogg, Hewston & Co., representing Thomas H. Selby, and the Selby Smelting Co. was formed from that concern. Mr. Underhill became the assistant secretary of the Selby Smelting & Lead Co. Later he became secretary, and remained in that position until 1906. Upon the resignation of Mr. Ralston, Mr. Underhill was made president of the company, and held that office until 1918, when the Selby Smelting & Lead Co. was dissolved as a corporation. The works still continued to be known as the Selby Smelting Works, operated by the American Smelters Securities Co. Mr. Underhill's work was not technical during these years in the company. He was in the financial end, for many years selling silver. Handling the silver question was his special forte. Mr. Underhill was associated with the business for a period of 52 years until the dissolution of the corporation, within a year and a half of his death. He remained president until the end. He was always recognized as a very courteous and kindly gentleman, and will be deeply mourned by his many friends.

THE METAL MARKET

METAL PRICES

San Francisco September 23

| | |
|--|-------------|
| Aluminum dust, cents per pound..... | 60 |
| Antimony, cents per pound..... | 9.50 |
| Copper, electrolytic, cents per pound..... | 33.00 |

| Zinc dust, cents per pound..... | 11.00—13.50 |

EASTERN METAL MARKET

(By wire from New York)

Sept. 23.—Copper is dull and easy. Lead is easy. Zinc is weak.

SILVER

Below are given official or ticker quotations, in cents per ounce of silver 999 fine. From April 23, 1918, the United States government paid \$1 per ounce for all silver purchased by it, fixing a maximum of \$1.01½ on August 15, 1918, and will continue to pay \$1 until the quantity specified under the Act is purchased, probably extending over several years. On May 5, 1919, all restrictions on the metal were removed, resulting in fluctuations. During the restricted period, the British government fixed the maximum price five times, the last being on March 25, 1919, on account of the low rate of sterling exchange, but removed all restrictions on May 10. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the normal rate of exchange.

FOREIGN EXCHANGE

Foreign exchange made substantial gains this week, both sterling and the Continental rates showing improvement. However, this does not necessarily mean that a definite turning point has been reached. The franc will hardly recover much until prospects become definite of a large credit to France. That country is reported as inquiring as to feasibility of a \$300,000,000 loan here and, while deferring the issue as far as possible, can hardly wait beyond the year-end for aid if no general scheme is meanwhile evolved. The latest entry in the wholesale procession of European applicants is Estonia. On this hemisphere a South American republic, presumably Chile, is said to have practically closed for a \$40,000,000 loan Peru also is needy. Sterling continues to gain strength gradually, thanks to improved prospects of relief under the Edge bill as a general factor, and more particularly on purchases against Transvaal gold bound here.

The Edge bill, the joint work of Senator Edge and Governor Harding of the Federal Reserve Board, providing for a federal charter for international banking and financing corporations as the best means of rectifying the now much disturbed foreign-exchange situation, has passed from the Senate to the House committee on banking and currency. Corporations can be organized immediately after passage of the Edge bill to assist our allies, and need not await signing of the peace treaty, but it is impossible to say whether many banks will avail themselves of the privilege at once. Although they feel the necessity of assisting our allies by extending credits, they consider this a national matter in which the Government should participate by lending more than moral support.

On a basis of 5% of capital and surplus of national banks, approximately \$400,000,000 is theoretically available for investing in the stock of these corporations. This sum could be somewhat increased by investments of private bankers and others, but would be inadequate to meet the present situation, it is thought.

Senator Edge has given the following description of benefits to be derived from his export finance bill: "It means acceptance of the principle that the national banking system should be expanded to recognize the necessity for co-operating in export financing. This measure will be a complement of the Webb-Pomeroy law; just as the Webb law permits commercial combinations for export business, so does this permit export financial combinations. Such financial corporations, it is true, may now be organized under State statutes, but under Federal incorporation and under supervision of the Federal Reserve Board, they unquestionably will be doubly safeguarded and their debentures be far more attractive to investors. Finally, as Governor Harding, of the Federal Reserve Board has well said, 'wildcatting will be precluded'."

"Although reasonable and adequate Federal supervision is provided, however, it may be noted that there is neither Federal participation nor underwriting nor guarantee."

"Beyond the direct benefit to America, the bill means much indirectly. It will stimulate our already shrinking exports by opening foreign markets, and the opening of these channels to all parts of the world means continued operation of all our industries, with consequent employment of labor at adequate wages. It means cargoes for our American merchant marine, now well over 1000 ships. It means normal and healthy readjustment of foreign exchange, and it means the preclusion of foreign embargoes or other discrimination against American goods. Finally, it means the rehabilitation of Europe so that in time it may repay its tremendous debt to the United States."

Quotations on September 23 are as follows:

| | |
|-----------------------|-------|
| Sterling: Cable | 4.18 |
| Demand | 4.17½ |
| Francs: Cable | 8.55 |
| Demand | 8.57 |
| Line: Demand | 9.75 |
| Marks | 5.00 |

Eastern Metal Market

New York, September 17.

All the markets are quiet. A possible steel strike and the unsettled condition in foreign exchange is checking progress.

Demand for copper continues light and is being satisfied by metal from second hands.

The tin market continues dull; spot tin, however, is scarce and firm.

Prices of lead have been advanced but trading is not heavy.

Buying of zinc is insignificant and confined to immediate needs. Prices have again declined.

Antimony is lower.

IRON AND STEEL

The net result of the persistent and disturbing agitation for a steel strike has been that little buying has appeared. Although it is probable that conservative leaders in the labor world will prevail and that there will not be a general strike of iron and steel workers, the threatened suspension of operations still causes apprehension. Pig-iron demand is not active and there are reports of weakness in basic and other steel-making irons. Awards of structural steel continue promising, a total of 27,500 tons being involved in large projects.

COPPER

The metal available from dealers and second hands continues to regulate the market. Considerable surprise has been the rule recently over the amount of copper thus offered. One explanation of this, and an interesting one, is that the Japanese have been offering considerable copper in this market. It is estimated that Japanese interests bought at least 15,000 to 20,000 tons in the days of heavy buying some weeks ago. This fact was called attention to in these letters. It seems now that there has been a change of conditions in the Japanese market for which this metal was originally purchased for consumption, in fact, more or less of a collapse there, and that this has caused the sales of some of the copper here. It is calculated that about 2000 to 3000 tons of this has been sold here recently. From outside sources electrolytic copper is available for early delivery anywhere from 22.12½ to 22.75c., New York, with Lake copper about ½c. above those levels. Large producers of electrolytic continue to quote in most cases 23.50c., New York, for early delivery and 24c. for October and last quarter, though it is stated that one or two have sold at ½c. under these levels. Demand in general is light.

TIN

The steel situation as to a possible strike continues the dominant factor. It is holding all buyers in check, there being no reason to buy if there is a strike as it is figured that prices of tin will fall. It is the opinion of one important broker that there is more reason for an advance than a decline in tin. The unprecedented situation in foreign exchange rates has also a retarding effect. If these two serious problems are adjusted satisfactorily it is believed that the tendency of the price of tin will be distinctly upward. The week as a whole has been a slow one in trading. Although there are heavy quantities of tin afloat, 6965 tons to date, most of this has been sold for consumption with the result that spot tin is scarce and firm. Spot Straits tin, New York, is quoted at 56.50c., New York, Lamb & Flagg, 99%, 55.25c., New York, and American electrolytic, 55.75c., New York. Arrivals of tin so far this month have been 1575 tons, of which 450 tons came through Pacific ports. Future shipment prices yesterday were: Straits for September-October ship-

ment from the East, 54c.; Straits for September shipment from England, 54.50c.; Lamb & Flagg for early October shipment, 54c. The London market is higher with Straits quoted yesterday at £288 per ton.

LEAD

The market is stronger and higher. On Monday the American Smelting & Refining Co. advanced its quotation from 6c. to 6.25c., New York, and the outside market followed suit. The St. Louis price is 6c. It is not believed that these levels can be shaded, not yet at least, in the outside market. The advance by the leading interest came as something of a surprise. To those well posted, however, it was not unexpected. It is claimed that production is light and stocks less than estimated by many and that a pinch in the market, particularly in the East, is probable this winter at the latest.

ZINC

There is no improvement in the market. The uncertainty of labor conditions in the steel market and the unprecedented exchange rate values are both holding this market, as well as others, back. Prices have continued to melt in the past week until yesterday prime Western for early delivery was obtainable at 7.15 to 7.20c., St. Louis, or 7.50 to 7.55c., New York, which we quote as the market. Prices for last quarter are indefinite without buyers or sellers being interested in view of the uncertainty of the future. Some producers are understood to be finding it to their advantage to buy zinc instead of producing it at present costs of labor and ores.

ANTIMONY

The strength of the silver market is stated to be the only factor that is keeping this metal from selling lower. Wholesale lots for early delivery are obtainable at 8.50c., New York, duty paid, with jobbing lots at 8.75 to 9c., New York.

ALUMINUM

No alteration in conditions or prices, which continue at 32 to 33c., New York, for wholesale lots for early delivery of No. 1 virgin metal, 98 to 99% pure.

ORES

Tungsten: The tariff question is still holding up the market. Very little business has been done and the market is disorganized. Opinions as to the duty question are at variance and there is not unanimity among those interested. A committee has been appointed to watch developments and determine what steps are necessary to protect the trade, according to a well known broker. The last quotations were nominal at \$7.25 to \$7.50 for Chinese ore, \$12 for Bolivian, and \$15 for Western scheelite.

Molybdenum: The market is quiet with quotations nominal at 70 to 75c. per lb. of MoS₂ in regular concentrates.

Manganese: The uncertainty as to the future of the ferro-manganese market has checked what little business was possible. Brazilian and Indian ores have been offered at 55 to 60c. per unit, seaboard.

Manganese-Iron Alloys: Demand for ferro-manganese is confined to carload and lots up to 300 tons for early delivery. The British producers are no longer attempting to 'dump' their product in American markets at \$95, seaboard, but are quoting \$105, seaboard, against the American price of \$110, delivered. Both are about equivalent. Spiegeleisen is very quiet at \$35, furnace.

More evidence of Marcy efficiency— the Arizona Hercules Mill

Three 500-ton Marcy Mills, taking ore direct from the coarse crushing plant, constitute the grinding unit at Ray Hercules—the new 1500-ton per day plant.

Here is a modern mill—steel and concrete construction—equipped with the most approved ore dressing machinery—the latest refinements in milling methods—adapted from the experience of well known metallurgical engineers.

Marcy Mills on a proposition of this kind are not selected on the basis of first cost economy—it's long run low-grinding-costs that count—and Marcy Mills crushing one easy step have demonstrated *not only* low cost grinding—they have achieved *non-selective* grinding, an important factor for improved extraction with most concentration methods.

Let us tell you more about the Marcy Mill.

ON another page we publish a description of the new Elmore process, which is designed to separate and extract lead and zinc from their ores and concentrates. The inventor is Mr. Francis E. Elmore, of oil-flotation fame. It will be noted that the company owning the patent is a strong one financially. We look forward to a successful demonstration of the process in this country.

CAR shortage for railroads, despite much unfavorable comment, is less serious than in recent years prior to the War, according to Mr. Walker D. Hines. He adds that the construction of 100,000 freight-cars ordered by the Railroad Administration is being hastened, and that every effort is being put forth to improve the service. We greet these announcements with the hope that triumphs over experience.

EVERY good citizen will regret the illness of the President and wish him a speedy recovery. Nervous dyspepsia is no joke, as most hard workers in office and library are only too well aware. The President's trans-continental tour of speech-making and public receptions must have involved a tremendous strain, mental and physical, one reacting on the other. His health today is precious to the country; we hope he may regain it speedily, so as to complete the serious business on hand.

JOHN C. GREENWAY is being mentioned in the Arizona press as a likely candidate for the United States Senate. We hope that the idea will be translated into action, for it goes without saying that he would make a good representative in the upper house of the Congress. Our readers are aware of his splendid record in two wars and of his successful administration of large mining enterprises, in the course of which he showed the highest qualities of a man and a citizen. The Senate would undergo a process of secondary enrichment if a few men of his type were added to its membership; just now it looks as if descending solutions had impoverished the outcrop.

ANOTHER institute has changed its name, by adding a reference to metallurgy. The Australasian Institute is now "of Mining and Metallurgy", following the example set by the similar American and Canadian organizations. There is much of "the everlasting monkey in man," as Marion Crawford said long ago. We deplore these changes in titles because 'mining' included geology, ore-dressing, and metallurgy, together with the

other arts and sciences applied to the winning of metals from their ores; hence the specific inclusion of the metallurgist only serves by implication to exclude the geologist, chemist, and other necessary technicians among those engaged in the industry of mining.

IT was announced at Paris that on September 25 the Supreme Council of the Peace Conference approved the report of the commission on Spitzbergen granting to Norway the political suzerainty over that group of islands in the Arctic sea. Spitzbergen, as our readers are aware, has been a *terra nullius*, or no man's land. Its anomalous status has checked industrial development, although an American coal enterprise was established there before the War under the leadership of Mr. John M. Longyear of Lansing, Michigan, and under the resident management of Mr. Scott Turner, now at Toronto. Just before the War the governments of Norway, England, Russia, and Germany had agreed to a conference for the purpose of arranging a joint control of the islands, but the outbreak of hostilities shattered the scheme. Disputes arising under the common law were tried at Tromsø, the nearest port, in Norway. The Norwegians are the logical caretakers of Spitzbergen, and we are glad therefore that the nations of the League have given her the political control.

TULE CANYON, Nevada, which extends south from Mount Magruder toward Death Valley, has lately become the scene of renewed activity in placer mining. This deposit of gold-bearing gravel is a valley some 12 miles long, and has long engaged the attention of capitalists interested in alluvial mining. Many examinations have been made with the idea of washing the gravel on a large scale, but each time the gold tenor, when calculated for the area required for extensive operations, has been considered too low to justify the necessary expenditure. More recently two organizations, the Tule Canyon Placer Association and the Goldfield-Tule Canyon Placer Mining Company, have started drift-mining in search of high-grade pockets that are known to exist. The gravel above bedrock is saturated with water, so that all that is necessary to obtain an abundance for washing is to sink a shaft thirty or forty feet deep through the gravel and erect a pump. It is quite possible that an erratic deposit too low-grade to warrant exploitation on a large scale may pay handsome profits to smaller organizations, with low overhead expenses, that are content to explore

for the high-grade pockets and work them in a small way; yet in these days of prohibitive costs, when established gold mines are struggling for their existence, it requires no small courage to start new work in a field that has been abandoned for years.

EMIGRATION is being much discussed, often with dire forebodings of the effect of a million or so foreigners returning to their own countries and taking with them four or five billion dollars in savings. All the money, of course, would be spent in their native lands; and the withdrawal of so many men from the ranks of labor would make a difficult situation still more difficult. Now comes the U. S. Commissioner of Immigration, Mr. A. Caminetti, deploring the "hysteria that exists in relation to emigration." He states that only 102,513 foreigners have left the United States since the signing of the Armistice, and a total of only 123,522 during the year ending June 30, 1919. In the five years ending June 30, the total was 618,225, as compared with 1,172,679 immigrant arrivals for the same period. This, of course, was during the War, when many foreigners did not return to their native countries through fear of being forced into military service. It seems likely that emigration will increase over the figures we have quoted, but apparently much of the fear of serious consequences is hardly warranted.

IT is announced that Mr. Edwin F. Gay, dean of the graduate College of Business at Harvard, has been appointed chief editor of the New York 'Evening Post', a great newspaper in the days when it was edited by such men as Lawrence Godkin, William Bryant, and John Bigelow, and even in later days, until Mr. Oswald Villard so tarnished its reputation as to cause the recent change of ownership. This appointment is interesting to us in California because Dean Gay had been mentioned as a possible successor to Mr. Benjamin Ide Wheeler in the presidency of the State university. His remarkable record during the War, as organizer of a series of bureaus of statistical information for the Shipping Board, the War Trade Board, and the Board of War Industries, had marked him as a man of extraordinary executive ability, so that before he left Washington he was asked by the President to organize a new bureau of all governmental activities. He is an expert in economic, international, and political matters. We wish him every success in his new field of work. After all, the editorship of a newspaper is a position of greater influence than the presidency of a university. As editor of the 'Evening Post', Mr. Gay will not only instruct the minds and sway the opinions of thousands, but he will influence the relatively few whose influence counts in his community. We would have liked to see such a man at the head of one of our San Franciscan papers rather than president of the University of California. Our universities are doing good work; our newspapers are beneath contempt. Whoever may be selected as the new president of the State university, even if he be on a parity with Dr. R. L. Wilbur of Stanford University, he cannot undo the evil done

daily by an ignorant and meretricious press—two in the morning and two in the evening. We ought to have men of wide learning and high character, such as are selected to be presidents of universities, as editors of our newspapers, because the newspaper is no less a means of education, and it operates for a longer period. The best of the youth of California, for instance, goes to Berkeley and Palo Alto for three or four years and during that brief period comes under the influence of the presidents of the two universities; but for twenty minutes or more every morning and every evening, and longer every Sunday, they have to sit mentally next to Mike de Young, Fremont Older, and William Randolph Worst. The influence of a high-minded College president is felt during an impressionable period, it is true, but that influence becomes less and less as the number of students runs into thousands; what good influence he exerts, largely through his faculty, is soon swamped by the iterative mental smudge left by a cheap and nasty newspaper. The community or State that spends millions annually on its University and allows its press to be controlled by accidental persons of no character is making a huge mistake. We hope the regents will elect a good president for the University, but we wish almost against hope that some man of equal moral worth could be placed at the head of at least one of our newspapers in San Francisco.

The Steel Strike

The strike of the steel-workers, which was started on September 22 to the accompaniment of riot and bloodshed, is running its course. It is a portentous event because it is the culmination of labor truculence, stimulated by a long series of successful strikes and encouraged by the timidity of the Administration at Washington. Like the big strike now paralyzing British commerce, this attempt of the workers in one of our basic industries is likely to develop into a contest, not with a group of manufacturers, but with the Government itself, for the Congress has taken cognizance of it and intends to inquire into the causes of it, a procedure that may compel the President himself to interfere. In the end the influence of public opinion will make itself felt unmistakably, and perhaps it is as well therefore that the strike should not have ended abruptly, because a sudden ending would have prevented the exposure of the factors that brought it about. The workers, through their leaders, complain that they cannot maintain a decent American standard of living. To this statement the Steel Corporation replies with the following average earnings for an eight-hour day: heaters, \$21.12; roughers, \$11.92; catchers, \$11.92; steel-pourers, \$12.84; vessel-men, \$14.65; engineers and manipulators, \$12.03. The average earnings of men employed on a twelve-hour shift are as follows: blooming-mill heaters, \$17.92; skelp-mill heaters, \$18.18; skelp-mill rollers, \$21.73; lap-welders, \$16.08; blowers, \$13.76; bottom-makers, \$12.91; regulators, \$13.52. These are skilled workmen. Semi-skilled labor is paid \$4.44 to \$8.26 per shift, usually of eight hours, and the majority earn over \$6 per day. Common labor

receives 45 to 50 cents per hour, or \$125 to \$140 per month; on the basis of an eight-hour day the maximum pay for skilled labor therefore is \$21.73, whereas the minimum for common labor is \$3.60. Another published statement gives the pay of the skilled employees as from \$7 to \$80 per day, and that of the unskilled as from \$3.50 to \$6. These figures do not justify the strike. If the commonest, most ignorant, alien laborer can earn four or five dollars per day, he is not warranted, under Irish-American leadership, in upsetting the whole country by means of a strike. A few days ago Mr. Hoover, referring to the building of his house at Palo Alto, said: "I have noted that the skilled laborer on this job is receiving \$8 to \$9 per day. As trustee of this university [Stanford], I note also that some 150 instructors and assistant-professors receive from \$3 to \$6 per day, and that they have families to support." One would suppose, from the wild talk of the leaders of the labor-unions, that they were the only people that are suffering from the high cost of living, whereas the fact is that common labor has had its demands adjusted more to its benefit than any other class of workers. As for skilled labor, in the mills, dockyards, and foundries, it has held this country by the throat during the War and has profited enormously during the five years that proved so calamitous to the rest of the world. But this strike is not one for higher wages only; it is a fight for the 'closed shop', that is, the recognition of the union and the compelling of every worker to join that union, so that the leaders of it may represent all the men in their collective bargaining with the corporation. For ourselves, we look forward to the day when every worker will join the union to which he naturally belongs, so that collective bargaining will be conducted on a truly representative basis, and, what is more important, the good citizens among the workmen will be in the union and assert themselves in it, to the discomfiture of the professional agitator. As it is now, the conservative and peace-loving workman keeps out of the union, leaving it in the hands of a minority of hot-heads; if a strike supervenes, he goes elsewhere, again leaving the control of affairs to the radical minority. The corporations are fully organized, and the workers should be likewise organized, not for purpose of battle but for the adjustment of their relations on a fair basis. The principle of refusing to permit combinations in restraint of trade should serve as an embargo on the combination of unions outside any one State. The so-called nation-wide strike is a colossal conspiracy against the nation, and it should not be tolerated. It is to be noted that this strike, affecting a vital national interest, was precipitated by a small group that was restive under the sagacious leadership of Mr. Samuel Gompers. The chairman of the strikers' committee is John Fitzpatrick, who, in his evidence before a committee of the Senate, asserted that the working conditions in the steel industry were "intolerable". Pinned down under cross-examination, he admitted that he had never worked in the steel-mills, had never been inside them, and was ignorant of the process of steel-making, and so had formed his impressions of working conditions altogether from hearsay. He

said that the skilled workers obtained "a mere pittance for the work they do" and asserted that "the industry pays less than paupers get." He himself was receiving \$75 per week as an organizer, or about as much as a first-class professor in a university. The investigation by the Congress is a good thing; it will elicit the information that the public needs in order to arrive at the merits of the quarrel. It should be noted that when Mr. Gompers was called before the Senate committee he testified that the strike had been started against his advice, which was to delay it, in accord with President Wilson's request, until after the Labor Conference on October 6. He acknowledged that the strikers were mostly aliens. "It has been said," he testified, "that most of the men taking part in this strike are of foreign birth and not naturalized citizens. That may be, and no doubt is, true. The largest proportion of steel corporation employees are of foreign birth, but these men were brought here by the companies." The last statement is fully warranted; the big corporations did combine with the steamship companies in swamping the truly American element in our population with a horde of inferior stocks, and it is, in a measure, a logical result that an unruly Irish-American should now lead these gangs of Finns, Slovenes, and Austrians in revolt against them. However, the quarrel does not concern these aliens and the steel-making corporations only; it concerns the public, it concerns the people as a whole. The manufacturers and the unions seem to overlook this fact, but before their quarrel is settled they will find that they have a reckoning to make with the nation. These fights between factions have been too frequent of late; the public is weary of them, and will shortly be irritated into calling for Government intervention. Meanwhile it is highly desirable that the causes of the strike be investigated impartially and that the public be given the information needed for a correct opinion. To us at this time it appears that the strike savors of industrial sabotage on the part of an unruly group of aliens, who talk of "the American standard of living" while they are engaged in making life in America difficult for the American people.

Herbert Hoover

On another page we give the full text of the speech delivered by Mr. Hoover at the recent dinner organized, in behalf of the engineering profession, by the American Institute of Mining and Metallurgical Engineers. The dinner was given at the Waldorf-Astoria hotel in New York on September 16; it celebrated Mr. Hoover's return home on the conclusion of his work in Europe; it was intended as a tribute of respect and admiration for the manner and success with which that humanitarian service had been performed; but it was more than that, it testified to the pride of the engineering profession of America in a fellow-craftsman who had proved himself a great leader of men during the anxious years when civilization seemed tottering to its downfall. The occasion was marked by an extraordinary assembling of the

members of his own profession and of his other friends. Twelve hundred or more went through the form of dining in order to take part in the celebration. It was not only a personal triumph for Mr. Hoover; it was the triumph of the American mining engineer. Other members of our profession have won international fame, some of them by *opera bouffe* tactics and others more worthily. He was not the first to be consulted by the kings and emperors of the old world, but those who preceded him were retained to advise upon the exploration of imperial estates or the exploitation of mineral deposits in colonial regions, whereas this Californian mining engineer was called upon to advise cabinets and governments in matters far more vital to human welfare: to prevent the starvation of whole populations and to save entire nations from the economic chaos of misgovernment. Our readers know the story. In 1914, when the Germans began to over-run western Europe, Mr. Hoover was honorably prominent as a mining engineer and financier in London. The opening days of the War were marked by a rush of Americans from the belligerent countries and the gathering of panic-stricken refugees in London itself. This exodus from Europe involved much distress and confusion. Mr. Hoover stepped forward promptly and aided the representatives of the United States by organizing a committee for assisting the refugees, with a success to which thousands of his fellow-countrymen are eager to testify. Soon afterward the plight of Belgium made an appeal alike to his human sympathy and to his executive ability; he organized the Commission for Relief in Belgium, taking with him in this work several of those who had helped him in steering and expediting the stream of American travelers and fugitives. What he did for Belgium is written large across the page of history. Next, as soon as his own country entered the War, he undertook the task of directing the distribution of foodstuffs in the United States; he was appointed Food Administrator and organized a bureau that not only proved of immense value to the national cause but won the cordial support of the American people, without distinction of class. As soon as the Armistice was signed he was asked by the President to serve as director-general of the Allied Relief Commission in Europe. Last February the Congress appropriated a hundred million dollars for this new benefaction; altogether he has had the spending of 800 million dollars and the responsibility of directing the economic salvation of two continents. Initiative and resourcefulness are not uncommon, it may be, but the combination of such qualities with a statesmanlike mind is rare indeed. The speech with which he answered the enthusiastic proposal of the toast in his honor—a toast proposed under the sobering limitations of a beverage compounded of ginger-ale, lemon, and ice-water, but stimulated by the intoxicating eloquence of an exuberant chairman—exhibits the insight of a student of history, the sagacity of a social philosopher, and the mature wisdom of a man who has surveyed mankind from China to Peru. Only 45 years old, he reveals a statesmanship that is rare at any age. He sees through the futile schemes of the half-educated proletariat of Europe and exposes

the pitiful vagaries of the anti-social mobs that have stood astride the wreck of civilization; he brings us back to first principles and demonstrates the fact that human happiness is dependent first upon productivity and then upon a fair division of the products of honest industry; for our benefit he analyzes the economic break-down in Europe, not to make us contemptuous of men and women in distress but to make us wary of following the shallow philosophies and rash experiments of those who have been crazed by the revolutions that have followed upon the heels of unsuccessful war. To the American people he brings a message couched in no uncertain tone, and he delivers it with all the authority of a prestige won by successful foresight and tremendous achievement. We have departed from the ideas of the old world and we have been spared from sharing its agony; it is for us to be humbly thankful for our good fortune and to be honestly purposeful in our effort to preserve our social ideals, not in selfish aloofness, but with a humane sympathy for those less fortunate than ourselves and a keen desire to help them in their trouble, as Mr. Hoover has done. Shall we flatter ourselves by regarding him as an exponent of the American spirit? He has set a standard of world service that not only we as individuals but the United States as a nation should be proud to accept as its own. He has directed the production and controlled the distribution of the resources of nature for the benefit of mankind at a time when mankind most needed such organization and leadership, as was suggested by Mr. W. L. Saunders, who presided at the dinner. Mr. Saunders quoted the definition inscribed on the wall of the library in the United Engineering Societies building in New York: "Engineering, the art of organizing and directing men, and controlling the forces and materials of nature for the benefit of the human race." This paraphrases the older definition to be found in the charter of the oldest engineering society, the Institution of Civil Engineers, in England: "The art of directing the great sources of power in Nature for the use and convenience of Man." In Mr. Hoover the initiative and resourcefulness that belong to a pioneer people were brought to the point of major effectiveness, as also by the American soldier in the closing days of the War, but in him they represented the combination of an unusual inheritance and a special training, from his Quaker forefathers in Indiana and from his university in California, supplemented by world-wide travel and by an experience of which it may be said that it broadened his sympathies for other peoples while deepening his love for his own country, its spirit, its ideals. In these days when the engineering profession is awakening to the responsibilities of citizenship and becoming articulate in its demand to serve the State, it is more than fortunate that an engineer and his engineer assistants should have demonstrated their fitness for the biggest work that our industrial civilization can require in times of crisis. Mr. Hoover has given the world a true conception of the function of the engineer, he has directed the resources of Nature to the welfare of man; in him the dream of engineering has come true on a heroic scale.

DISCUSSION

Utilizing Furnace Slag

The Editor:

Sir—Why is not slag made into useful products by compressing it in suitable forms and molds while in a liquid state in the way that glass is so perfectly molded? Smelting companies buy from distant points clay products such as building brick, hollow tiles, sewer and drain

Section I-I

- A. Air cylinder
- B. Stationary rifle bar
- C. Plunger and pipe-mold
- D. Sliding bottom block
- E. Cover-plate
- F. Cover-plate vent and overflow poles
- G. Cover-plate clamps
- H. Cover-plate dowels
- I. Plan of elliptical core and plunger

UTILIZING FURNACE SLAG

pipe, etc., and also use lumber and concrete for purposes that could be better served by slag products made on the spot if there were some satisfactory method of molding shapes from their own slag. With this thought in mind, I am suggesting in my sketch a scheme for making sewer pipe, which is a somewhat difficult shape to make and burn even with good clay. If sewer pipe can be made in the way I describe, brick, hollow-tile, and simple shapes like launder-liners of dense structure and true to form could be still more easily made.

Before starting operation the mold is heated by placing a red-hot iron billet in it. When this is removed a

proper size ladle of slag is dipped from the well on the side of the furnace, or from the slag stream if the furnace has a continuous flow. The slag is poured quickly into the hinged mold *C*. Instantly the plunger is brought down into and through the mold. This plunger forms a core for the inside of the pipe and at the same time forces the liquid slag outward and upward against the inside of the mold, the pressure forcing the entrained air and surplus slag out through the vent-holes in the top cover-plate *E*. The plunger or core is not round but elliptical, and descends and rises with a twisting motion caused by the rifled nut *B* on the plunger-rod. The plunger is allowed to rest at the bottom of its stroke until the slag is partly set but still plastic. Before the slag has become entirely hard the plunger or core is raised out of the mold by the air-piston with the same twisting motion with which it entered. Consequently, as the plunger is elliptical the plastic slag forming the walls and bell of the pipe is further compressed and the inside of the pipe enlarged to the diameter of the long axis of the ellipse. The newly made slag-pipe is allowed to cool somewhat in the mold. The top cover-plate *E* is then removed, the divided mold unlatched, and the half swung back on its hinges and the slag-pipe taken out. The mold is closed and latched again; the top cover-plate replaced and clamped down, and it is ready for another pour, as the mold is still hot from the previous cast. The toughness of the slag-pipe would depend upon the composition of the slag and the care taken in gradually cooling or annealing the pipe after it is made. But it would surely be more dense and durable than the ordinary vitrified or partly vitrified clay pipe of commerce and also much cheaper to make.

This scheme may seem at first a radical departure that is uncertain of success, but really it is only applying to slag the method commonly used in the glass factories for molding articles of glass by compressing them while in a molten state. The glass people can now make in this manner big pieces of intricate shape and design, but it was necessary for someone to experiment before they reached their present perfection. Similarly slag products will not be perfectly made until someone tries the scheme properly.

W. M. BARKER.

McGill, Nevada, September 10.

The Crowe Process

The Editor:

Sir—Mr. E. M. Hamilton, in his contribution to 'Discussion' in your issue of September 6, misses entirely the consideration of the patentability of the Crowe process and apparatus, which I denied in my letter. An essen-

tial requirement of the U. S. Patent Office before the granting of a patent for a process or for an apparatus, is that the alleged invention be novel, that is, new. Let us see whether there is anything new in the combinations of the elementary parts which constitute the three claims which I put forward in my letter as sample ones of the thirty-one of the patent.

Claim 4 reads: "The process of precipitating material from its solution which consists in subjecting the solution to a vacuum and precipitating the material from the solution." This claim, if it could be sustained as novel, would be the strongest of the thirty-one. But in each of the four anticipations which I cited in my letter there was material in solution, the solution was submitted to a vacuum, and the material was then precipitated. If claim 4 has any legal control in the art involved, no one, without the consent of the owner of the Crowe patent, can now use the apparatus and process described in the anticipations cited by me and described by Lamp in 1907; by Tweedy and Beals in 1910; by Chase in 1911; and by Carpenter in 1915. The corollary of this is that a claim for an older combination of elementary parts has no patent, or patentable, value.

Claim 14 reads: "In an apparatus for precipitating material from its solution, a closed chamber receiving the solution, and means for creating a vacuum in said chamber to remove from the solution gases which interfere with precipitation." This claim is for the apparatus, and claim 4 is for the process. Each of the four anticipations that I cited contains the combination of elementary parts of claim 14, namely: The apparatus, the closed chamber, and the means for creating the vacuum for removing the gases.

Claim 29 reads: "The process of precipitating valuable metal from metal-bearing cyanide solutions, which consists in removing from the solution gases which interfere with the precipitation and subsequently precipitating the valuable metal therefrom by flowing the solution in contact with a metal capable of precipitating the valuable metal from the solution." Each of the four anticipations includes descriptions of how the valuable metals were brought into solution, the gases removed, and how they were precipitated by flowing the solution in contact with zinc; precisely as this claim No. 29 recites.

Such patent claims are worthless, and the remaining 28 are equally so.

Mr. Hamilton, referring to my contentions, has mixed his postulates. He uses as headings (1) anticipated, and (2) consciously anticipated. Then he discusses under (1) anything and many things other than the anticipations I cited in my letter; and then under (2) assumes that I failed to show that the anticipations were due to conscious efforts to benefit the solutions by de-aeration. I did not hold that there was any conscious effort in that direction. As to patentability, either conscious or unconscious intentions or efforts have no bearing.

Liquids submitted to a vacuum part with their occluded gases, and assume inherent or innate qualities. In that way they acquire the quality which is claimed as newly applied under the Crowe so-called invention.

There is nothing to show in the patent that that quality is the invention of Crowe. A quality is not patentable. A new method of conferring a quality on a material is patentable. And so is an original apparatus for the method. But in the case of the patent under consideration neither quality, method, nor apparatus was new in 1916.

I will not encumber the record with criticism of Mr. Hamilton's immaterial statements. Mr. Hamilton misses the statement made on page 35 of the Julian and Smart book, which is as follows: "A cyanide solution of 0.2% is then passed through the ore and the loss noted." There we have a cyanide solution passed through the ore into a Wolff bottle, used as a vacuum-chamber, from which entrained or occluded air is withdrawn by a well-known exhausting apparatus, thus preparing the solution for subsequent treatment. This, the last stage in metallurgical practice, is precipitation of its metal content.

I will correct one of Mr. Hamilton's statements by quoting from Mr. Crowe's paper: "When the vacuum was suddenly applied a cloud composed of thousands of small air-bubbles rose out of the solution . . . also proving that the relief of atmospheric pressure on the solution permitted the dissolved air to escape."* This has been long known in physics. The solution was quiescent in an acid bottle, and the top surface only was submitted to the vacuum. Also: "A vacuum system was applied to pregnant solution in November 1917, but no definite results can be given at this time beyond stating that precipitation is uniformly lower than before adoption."† This was in the Barnes-King mill, at Marysville, Montana.

Spraying a liquid in order to expose a greater surface to the action of a vacuum was practised in the arts years before this alleged invention.

All my statements and criticisms are intended to be in the interest, or for the benefit, of the mining and metallurgical engineers and operators.

Philadelphia, September 11.

N. S. KEITH.

LABOR CONDITIONS in Alaska continue unsettled, although there have been and are no indications of trouble of any kind. Laboring men assert that the wages offered by the mining and public works industries are not such as justify them in laying off their coats and going to work, with the result that coats are being worn by a considerable number of the working class. The fact remains, however, that there is plenty of work at which men can make from \$3.50 to \$5 per day and board.

THE ALASKA AERIAL Co. was recently incorporated in Seattle for \$500,000, for the purpose of building five DeHaviland biplanes, three of them large and to cost \$50,000 each, to be operated as passenger and freight carriers between Valdez, Fairbanks, Nome, and Arctic points in Siberia. Machine shops for the upkeep and maintenance of the biplanes will be constructed and operated at Valdez.

Herbert Hoover on Conditions in Europe

Text of His Address at the Dinner Given in His Honor by the American Institute of Mining and Metallurgical Engineers

I have been asked to speak to you on some of the impressions that I have gained during my service in Europe since the Armistice. Two convictions are dominant in my mind. The first comes from contact with the stupendous social ferment and revolution in which Europe is attempting to find solution for all its social ills by practical experiments in Socialism. My conviction is that this whole philosophy is bankrupting itself from a startling quarter in the extraordinary lowering of productivity of industrial commodities to a point that, until the recent realization of this bankruptcy, was below the necessity for continued existence of their millions of people.

My second conviction is older but has been greatly hardened, and that is a greater appreciation of the enormous distance that we of America have grown away from Europe in the century and a half of our national existence, in our outlook on life, our relations toward our neighbors, and our social and political ideals. The supreme importance of this Americanism neither permits us to allow the use of this community for experiment in social diseases, nor does it permit us to abandon the moral leadership we have undertaken for restoring order in the world.

During the last ten months I and my colleagues have occupied a unique position in intimate witness of the social currents that have surged backward and forward across Europe.

The enemy collapsed not only from military and naval defeat but from total economic exhaustion. In this race to economic chaos the European Allies were not far behind. By this exhaustion, the whole of Europe stood facing a famine the like of which has not been seen since the Thirty Years war, when a third of the population died of starvation. In the midst of all this was the struggle of a score of new democracies to establish themselves, with friction along every frontier, and, with the destruction of governmental institutions, without financial resources to buy supplies, with the miseries of their people offering fertile soil for every economic patent medicine and for all the forces of disorder, Bolshevism, and anarchy, and, overhanging all, there could be no hope of restoring normal economic life until the completion of peace. In all this situation, with its desperation, greed, century-old animosities, its idealistic and proper aspirations, there was only one hope. That hope, expressed by every city and state, was that the American people, being the one disinterested and uncrippled economic and political force still existing in the world, should again intervene. It was in response to this call

that the President, comprehending the real heart of the American people, intervened in Europe a second time and took those steps which resulted in a practical economic organization of Europe, pending the consummation of peace and the arrival of the forthcoming harvest.

This second intervention was not a relief problem in the ordinary acceptance. It was not a problem alone of finding foodstuffs for starving populations of the ravaged regions. It was the problem of finding a large margin of foodstuffs and other supplies for the whole of Europe— allies, liberated peoples, neutrals, and enemies; and in a mass of at least 200 millions of these people formerly under enemy domination it was a problem of finding absolute economic rehabilitation. Further than this, it was a problem of warding off Bolshevism on one side and reaction on the other, in order that the new-born democracies could have an opportunity for growth.

Its practical consummation was a problem of the organization of the economic strength of the United States and its co-ordination with the remaining economic strength of Europe, and, in large areas, the imposition of absolute dictatorship over economic forces. Thus, the shipping of the world required sufficient co-ordination to transport 30 million tons of supplies from all quarters of the globe to Europe. It required the provision of credits to those countries whose total exhaustion abolished all hope of normal payment. It required the insistence upon payment from those who had gold or commodities. It required sufficient co-ordination of purchase in this vast quantity of supplies that the markets of the world should be affected in the least possible degree. With the dissolution of the organization of the old channels of communication, river craft and railway rolling-stock were hoarded by each State; telegraph and postal communications were broken down; every frontier was the scene of more or less military friction, until at one moment there were 25 little wars in progress. Many of these new governments were without experience or even without the existence of departments for the conduct of either the transportation or distribution of supplies.

Thus, it was necessary to secure the creation within their governments of actual departments, to furnish them advisors, to take over the actual operation of thousands of miles of disintegrated railway systems, to open rivers and canals for traffic, to stimulate the production of coal and other primary commodities, to control their distribution through large areas, to find a basis for exchange of surplus commodities from one State to another, to exercise the strongest political pressure to obtain the disgorgement of surpluses into areas of famine, to resort to barter

on a national scale where currencies had broken down, to stimulate peoples discouraged and disheartened to efforts in their own salvation, and finally, but not least, to intervene a charitable hand in the saving of their children and the stamping out of contagious diseases, and through all of this economic disorganization to inspire the maintenance of order on one hand and the defeat of reaction on the other. Beyond this again, the necessity of constant friendly intervention in frontier quarrels to prevent the starting of more wars.

These things have not been solved by the service or direction of any one man. They have been accomplished through co-ordination of the men of good will in twenty governments of Europe and throughout by creation of a thread of American personnel, directed from a single centre. On our side it has required the co-operation of Congress, the Grain Corporation, the Treasury, the Shipping Board, the Army, and the Navy. A thousand Americans were sent into these communities with but little authority beyond their own assurance and the confidence on all sides that they were disinterested, that their only desire was to solve a great and human emergency for no political and no commercial advantage. It was our desire to do this from the background, without ostentation, to act at all times through established institutions, to build up their strength for the time they must rely upon their own resources. I cannot pay enough tribute to all these thousand Americans, many of them engineers, men taken from the common life of the United States, thrust into the face of staggering political and economic problems, the solution of which must affect the well-being not of hundreds but of millions. The proof of their performance lies in the fact that Europe has come through the most terrible period of its history with no loss of life from economic causes, with a stronger democracy and a glow in its heart for the United States.

This service of American people has been accomplished at no mean national sacrifice. From the Armistice to this year's harvest there has been furnished over two and a quarter billion dollars' worth of supplies, the majority of which has been given freely upon the undertaking of the assisted governments of re-payment at some future date. There has been no demand of special security; no political or economic privileges have been sought. It may be years before we receive any return from these loans, but if that period should never come the American people, by this second intervention in Europe, have saved civilization, and have done so with no thought of the burden or cost to themselves. These matters have been brought to a successful close with the arrival of the harvest and the prospect of peace. What the future has a right to demand from us in further economic support is not yet clear, but it is at least certain that if the world cannot quickly secure the settlement of peace and safeguards for the future through the League, the whole of our two great interventions in Europe will have gone for nothing, and the menace of reaction will again return against us upon the wings of chaos.

As the executive head of this Allied effort in economic control, I have thus had an intimate contact with the

common people and their officials. I have witnessed their improving physical condition, the constant change of currents of social, political, and economic forces, their revolutions, and I have had to deal intimately with the results of all these phenomena. During this period since the Armistice, we have witnessed social and political revolution among one-third of the civilized world, and we see the remainder in great social tribulation. No contemporary can properly judge or balance the relative volume of great currents of social agitation. They are matters of mind and not of matter. Yet practical statesmanship requires that within our abilities a constant accounting should be taken of the tangible results of these forces abroad, if the development of our liberal institutions and the progress of orderly government is to be maintained and revolution avoided.

This cataclysm of social change in Europe is the result of the long cumulation of social as well as political wrongs; it is no sudden afterthought of war. These forces were projected into actual realization by the collapse of the War, the breakdown in the political institutions that had preceded it, and the misery that has flowed from it. Our soil is not so fertile as that of Europe to many of these growths, because we have a larger social conscience. We have not the vivid class and economic distinctions of Europe, nor have we the depth of misery out of which these matters can crystallize. Nevertheless, in these days of intimate communication, social forces are rapid in their penetration and social diseases are quick in universal infection.

The general revolution of Europe of the last century, starting with the French revolution, profoundly changed the whole social order of the world, and, while in that revolution the spiritual impulse was the demand for political liberty, there was also a great economic impulse. That economic impulse was primarily the division of the land, and one of the fruits of that revolution was the better distribution of wealth among the agricultural population. Since that time an enormous expansion of mechanical industrialism has been superimposed upon all agricultural States, with a large increase in urban populations. The economic impulse of the revolution today is the demand for a better division of the wealth from this industrialism, and this time the agitation arises mainly from the urban populations.

These vast masses of humanity in Europe have long been groping for the method of nearer equality of opportunity and better distribution of the results of industrial production. These gropings and these attempts have in recent years been dominated by Marxian Socialism, developed in different degrees of intensity. Broadly, these revolutions have taken two forms: the Bolshevik form, through which there has been over-night 'communization' of all property, and second, the milder form of legislative nationalization of industry. I believe we are now in position to take some stock of and to form some judgment as to the adequacy of these solutions for what I believe every liberal-minded man believes is a necessity—the better division of industrial production.

We require only a superficial survey to see that the out-

standing and startling economic phenomenon of Europe today is its demoralized industrial production. Of the 450 million people in Europe, a rough estimate would indicate that they are at least 100 million greater than could be supported on the basis of production, which has never before reached so low an ebb. Prior to the War, this population managed to produce from year to year but a trifling margin of commodities over the necessary consumption and to exchange for supplies from abroad. It is true that in pre-war times Europe managed to maintain armies and navies, together with a numerically small class of non-producers, and to gain slowly in physical improvements and investments abroad, but these luxuries and accumulations were only at the cost of a dangerously low standard of living to a very large number. The productivity of Europe in pre-war times had behind it the intensive stimulus of a high state of economic discipline; the density of population at all times responded closely to the resulting volume of production. During the War, the intensive organization of economy and consumption, the patriotic stimulus to greater exertion, and the addition of women to productive labor, partially balanced the diversion of man-power to war and munitions. Both the pre-war and the war impulses have now been lost and the productivity of Europe has steadily decreased since the Armistice.

It is true that some of this diminution in production has been contributed to by the other factors, but in the larger degree the cause of this steady decrease of productivity, with its shortage of necessary supplies and its rising cost of living, must be sought in the social ferment, with its continuous imposition of Socialist ideas. In this ferment the advocates of Socialism or Communism have claimed to alone speak for the downtrodden, to alone bespeak human sympathy, to alone present remedies, and to be the single voice of Liberalism.

We may examine these phenomena a little more closely. In Russia we have a great country in which the population, with the exception of a small minority, were comparatively well fed, warmly clothed, and warmly housed. They were subject to the worst of political tyranny, were deliberately steeped in ignorance and superstition, yet their productivity was sufficient to enable them to provide these primary comforts and to export more food-stuffs than the United States. Socialism was brought in over-night at the hands of a small minority of intellectual dilettanti and criminals, and this tyranny of minority, more terrible even than the old, has now had nearly two years in which to effect the conversion of the wicked competitive system into the Elysium of Communism. Today two-thirds of the railways and three-fourths of the rolling-stock that they control are out of operation. The whole population is without any normal comforts of life and is plunged into the most grievous famine of centuries. Its people are dying at the rate of hundreds of thousands monthly from starvation and disease. Its capital city has diminished in population from nearly 2,000,000 to less than 600,000. Prices have risen to fantastic levels. The streets of every city and village have run with the blood

of executions, nor have these executions been confined to the so-called middle and upper classes, for lately the opposition of the workmen and farmers to this regime has brought them also to the firing squad in appalling numbers.

If we examine the recent proclamations of this group of mixed idealists and murderers, we find a radical change in their economic and social ideas. They have abandoned the socialization of the land, for they find the farmer will not produce for payment in high-flown and altruistic phrases. They have re-established a differential wage and in an attempt to stimulate exertion and ambition of skilled labor. They have established a State Savings Bank, in order to stimulate production through making provision for family and old age. They are offering fabulous salaries for men capable of directing the large agencies of production. In fact, while in the midst of flowery verbal endeavor to maintain that they are still Socialists, they are endeavoring to restore individual ownership of property and of the results of labor. The very high-priest of Socialism is today vainly endeavoring to save his people from their total destruction by summoning back the forces of production. The apologists of this debacle are telling us that it is due to the Allied blockade, and to various other oppositions, but any one with a rudimentary knowledge of Russia knows that they did have within their borders ample supplies of food, coal, oil, wool, flax, cotton, and metals, and the factories with which to work them in abundance, and that their sole deficiency is human effort.

We could take another example of Bolshevism in the efforts of Bela Kun and his colleagues in Budapest. The distinction between this situation and Russia is that they were dealing with a population of much higher intelligence, of much higher average education, and it required but three months for the working people of Budapest to realize the fearful abyss into which they had been plunged. It was solely due to the efforts of the trade-unions in Budapest that the Bolsheviks were thrown out of Hungary.

These are the extreme points where Socialism has had its opportunity for immediate and wholesale application, according to all of the precepts of its advocates. Elsewhere in Europe Socialism has proceeded through established institutions and we may shortly examine the results here also.

During the War large measures were taken on both sides of the front to secure the mobilization of production and distribution to its maximum use in the struggle. There was effective socialization of vast sections of industry. These measures are being continued and extended today in many places by governments anxious to maintain the stability of institutions even at the sacrifice of economic safety, but under the threat of minorities of revolutionary action. Yet here again the same prime weakness has proved itself. The only partial success of these measures in war was due to the great patriotic impulse of war. Those who conducted these large operations were men whose initiative and capacity had been

selected by the competitive system. These war impulses have been lost, and these organizations with constantly decreasing efficiency even in war now face disaster from further reduced productivity. All these decreases have immediate results in a rising cost of living or the necessity of governments to subsidize commodities—such as bread. There is no better example of this than the coal industry of Europe, and even omitting Russia, this production has fallen from a rate of 600 million tons per annum at the Armistice to a rate of 450 million tons recently. The coal industry is in modern life the very life-blood of the State, and it has proved itself the most susceptible among all the industries to these influences, and its production today is at such an ebb as to jeopardize the entire social fabric. I am convinced that the greatest proportion of European leaders of Socialism today to some extent realize this bankruptcy and are today endeavoring to cover a retreat with loud complaints as to the failure from other causes. Nevertheless, the realization itself is a great step and is bringing the turn of the tide and through it Europe is on the road to economic recovery—if she gets peace.

The whole of these various sorts of Socialism is based on one primary conception, and that is that the productivity of the human being can be maintained under the impulse of altruism and that the selection of the particular human for his most productive performance can be made by some superimposed bureaucracy. Their weakness is the disregard of the normal day-to-day primary impulse of the human animal, that is, self-interest for himself or for his family and home, with a certain addition of altruism varying with his racial instinct and his degree of intelligence. They fail to take into account, also, that there is but one sufficiently selective agent for human abilities in that infinite specialization of mind and body necessary to maintain the output of the intricate machinery of production, and that is the primary school of competition.

My emphatic conclusion is, therefore, that Socialism as a philosophy of possible human application is bankrupt.

Although Socialism has now proved itself with rivers of blood and suffering to be an economic and spiritual fallacy and to have wrecked itself on the rock of production, I believe it was necessary for the world to have had this demonstration. Great theoretic and emotional ideas have arisen before in the world's history and have, in their bankruptcy, deluged the world with fearful loss of human life. A purely philosophical view might be that these experiences are necessary to humanity, groping for something better. It is not necessary, however, that we of the United States, now that we have witnessed these results, should plunge our own population into these miseries and into a laboratory for experiment in foreign social diseases.

Bankruptcy of the Socialist idea, however, does not relieve us from the necessity of finding a solution to the primary question which underlies all this discontent. That primary question is the better division of the prod-

ucts of industry and the steady development of higher productivity. This bankruptcy of the Socialist idea should, if reaction is to be prevented, return the guardianship of this problem from the radical world to the liberal world of moderate men, working upon the safe foundations of experience.

The paramount business of every American today is this business of finding a solution to these issues, but this solution must be found by Americans, in a practical American way, based upon American ideas, on American philosophy of life. A definite American substitute is needed for these disintegrating theories of Europe. It must be founded on our national instincts and upon the normal development of our national institutions. It must be founded too upon the fundamental fact that every section of this nation, the farmer, the industrial worker, the professional man, the employer, are all absolutely interdependent upon each other in this task of maximum production and the better distribution of its results. It must be founded upon the maximum exertion of every individual within his physical ability and upon the reduction of waste both nationally and individually. We can well see a vivid confirmation in Europe of the fundamental economic principle that the standard of living and the cost of living is the direct quotient of the amount of commodities produced; that we must secure a maximum production of the industrial machine if we wish to keep our population alive or if we wish to see an increase in the standard of living of our people. From this only can arise the very foundations of the higher activities of life. The application of this proposition must, however, stand several tests. A maximum production can only be obtained under conditions that protect and stimulate the physical and intellectual well-being of the producer. We shall never remedy justifiable discontent until we eradicate the misery which the ruthlessness of individualism has imposed upon a minority.

If I were thinking aloud I would say at once that this maximum production cannot be obtained without giving a voice in the administration of production to all sections of the community concerned in the specific problem; that it cannot be obtained by the domination of any one element. I would say that the human race had increased its standards of productivity and therefore of living through the growth of extraordinarily intricate organization of production and distribution based upon stimulation of the individual by the reward it offers. I would also say that it cannot be obtained from the destruction or sudden disturbance of this delicate and intricate organization of production and distribution or extravagance in its products. I would say the road lies along the better division of the more exorbitant profits that arise from these processes and that have accumulated from them. By better division of profits, I do not refer particularly to profit-sharing schemes, but to the broad issue of the whole social product. Some are comparatively overpaid and many are comparatively underpaid for the service they render to the community. Our organization in many aspects is not all that we could desire, but it is the

best we have been able to evolve over thousands of years, and the destruction of these processes or of the organization which conducts them has been demonstrated to be the sure road to destitution and fearful loss of life.

It is not that we, today, have suddenly awakened to this necessity for better distribution of profits. The social conscience of this country has been manifesting itself continuously concerning this matter for years. We have in the United States today a better division of wealth and a greater equality of opportunity than any other nation in the world, and we have thus a better foundation upon which to build. We have reason for discontent in the fact that our industrial development has outrun our social progress; and we have reason to hasten those measures that lead to larger justice in the distribution of these profits and larger representation of all elements of the community in the control of these agencies, to further strengthen our measures for the restraint of economic domination by the few and for the liquidation into the hands of the many of the larger industrial accumulations in the hands of the few that our rapid development has made possible.

Again I wish to repeat, the observation of these forces in Europe has reinforced my Americanism during these last ten months of intimate contact with them; it has revealed to me the distance of our departure from the political, social, and economic ideals of Europe. There has grown in this United States a higher sense of justice, of neighborly service, of self-sacrifice, and above all a willingness to abide by the will of the majority in every section of this community. This Americanism is the guarantee of the ability of our people to solve this most momentous internal problem confronting our generation. But these very ideals, this very sense of justice and service for our own people give us still further opportunities. Our sister civilization in Europe is today recovering from a great illness. The many new democracies that we have inspired are striving for our ideals. We alone have the economic and moral reserve with which to carry our neighbor back to strength. To do this is also true Americanism.

WALLACE THOMPSON, formerly American vice-consul at Monterrey, Mexico, says American investments in Mexico had grown to value of \$2,000,000,000 when Diaz fell in 1911. Physical damage to American property is estimated at \$80,000,000. Damage claims totaling \$500,000,000 have been filed with the American State Department, including claims for losses in profits during the period of revolutions. Of \$300,000,000 invested in Mexican oilfields, \$200,000,000 is American. Actual physical losses of American oil companies are placed at \$5,000,000. This does not include failures of most of 300 American companies that have put money into Mexican oil, nor does it take into consideration potential losses if Carranza enforces his "nationalization" plan. The Carranza tax system now in force is said to cost the oil companies \$1,000,000 monthly. American investment in Mexican mining is placed at \$200,000,000 with physical

losses of \$15,000,000. The greatest damage to mining properties was indirect, resulting from abandonment during periods of fighting. National Railways of Mexico, worth \$250,000,000 as physical plant alone when taken over by the Carranza government in 1914, has been all but destroyed.

Mining in Washington in 1919

The metal output of the mines of Washington during the first half of 1919 was seriously curtailed by the drop in the prices of metals which followed the signing of the Armistice, according to C. N. Gerry, of the U. S. Geological Survey. Production, however, will probably increase as conditions adjust themselves to normal times. The metal output in 1918 was valued at \$1,467,421, a decrease from \$2,289,285 in 1917. The present rate of shipments indicates that there will be decided decreases in the output of gold, silver, and lead in 1919. The ore output in 1918 was 138,911 tons, part of which was milling ore. Chewelah district, in Stevens county, produced 3517 tons of concentrate and 1442 tons of crude shipping ore, and the Republic district produced 42,213 tons of shipping ore. The monthly shipments of copper ore and concentrate from Chewelah district were not greatly changed in 1919, but the shipments from Republic were curtailed to less than 2000 tons per month in the early part of the year. The shipments of copper ore from Index, in Snohomish county, were maintained, but those from Okanogan county decreased decidedly. The metal output in 1918 was \$304,658 in gold, 310,093 oz. of silver, 1,922,406 lb. of copper, 5,271,815 lb. of lead, and a few pounds of zinc. No shipments of zinc ore were made from either Northport or Metaline Falls in the early part of 1919.

The conditions and prospects in the smelting industry were by no means encouraging. The Northport Smelting & Refining Co. closed its lead plant on February 25, and the Tacoma smelter was said to be running only one out of three copper furnaces. As the smelter at Trail, B. C., refused custom ore from Washington, the Electric Point mine was forced to ship to Midvale, Utah. In March operations were suspended at this mine, which is the source of most of Washington's lead output. A new flotation plant was constructed at the Loon Lake mine, in Stevens county, a dressing plant was added to the equipment at Northport, and ore of good grade was opened at depth in the United Copper mine at Chewelah.

CONSIDERABLE attention is now being drawn to the Valdez district, Alaska, on account of a platinum discovery eight miles from the town. The ground also contains another mineral which is believed to be tungsten. Many claims have recently been located. The ground is admirably situated for hydraulicking, and there is water in abundance. The Teikhell district, also near the Valdez, is now being extensively prospected and many rich ore samples are being brought in.

The Power-Plant, Machine-Shop, and Foundry of the Utah Copper Company

By FRANK G. JANNEY

POWER is being furnished to the Utah Copper Co.'s plants at Garfield by the Utah Power & Light Co. and is delivered from their terminal station, about five miles west of Salt Lake City, over two steel-tower transmission lines at 42,000 volts, three-phase, sixty-cycle, to the Utah Copper company's central station at Magna. These lines are connected into the station through 70,000-volt oil-circuit breakers to a ring bus in the station; each line is protected with reverse-energy relays, which, in the event of trouble on either of the lines, automatically disconnects it from the system, thus avoiding an interruption to the plants.

The ring bus, which is composed of 1-in. copper tubing, is so arranged that any part of the equipment can be cut out for inspection or repairs, through sectionalizing switches, without affecting service. Distribution is made from this station to the various sub-stations at the Magna and Arthur mills. Power is delivered to each sub-station with two circuits of three wires each of 250,000 C. M. stranded conductors at a potential of 42,000 volts; both circuits are supported on steel towers with suspension insulators, each circuit is controlled with overload relays, and is of ample capacity to furnish all power required at point of delivery.

At the sub-station the circuits are controlled by 44,000-volt oil circuit-breakers from which power is delivered to a vertical bus, supported with suspension insulators, through disconnecting switches and an automatic 44,000-volt circuit-breaker, to the transformers, through which the pressure is reduced to 460 volts. The installation at the Arthur sub-station consists of three banks of transformers, having a normal capacity of 21,500 kva. supplying current to 1283 motors, ranging in size from $\frac{1}{4}$ to 300 hp. at 440 volts. An extra transformer is provided and arranged with primary and secondary switches so that it may be put in service to relieve a defective transformer without causing an interruption of service.

The secondary distribution circuit to the motors is of three-conductor varnished cambric insulated cables with a double-braid weather-proof covering, tested for a working voltage of 1000 volts. Each secondary circuit is protected with an automatic oil-switch, through inverse time-limit overload-relays. Motors are protected with overload-relay and low-voltage release, by which in event of an interruption of power-service, all motors are automatically disconnected from their supply-circuit.

A complete signal system of colored lights is maintained between the sub-station and all parts of the mill, enabling the operators to control the power-supply at all points, and thus avoid any unnecessary high-peak de-

mand. This signal system is also used for reaching any of the foremen or heads of departments that may be needed. A telephone system is also maintained with instruments placed in all offices and convenient places in the plant, thus enabling the superintendent and others in charge to be in close touch with operations in the various departments. The efficacy of the telephone and signal system is best demonstrated during an interruption of power service. When all the machinery is at rest the time required to get it moving and operating rarely requires more than 12 or 15 minutes.

FOUNDRY. In 1910 this was in a small, poorly lighted and ventilated building 61 by 62 ft. Outgrowing this small building, a new shop was completed in the early part of 1911, the building being 80 by 120 ft. Remodeling and additions to the mills and the building of the Bingham & Garfield railroad increased the work to such an extent that the foundry was lengthened 75 ft. in 1912, 30 ft. in 1915, and 90 ft. in 1917. Today the main building of the foundry covers a space of 80 by 315 feet.

After allowing for chipping-room, core-room, and cupola-space, the molding-floors have an approximate area of 16,000 sq. ft. The foundry equipment is modern in every respect, making work-conditions ideal. In the core-room are modern oil-fired furnaces. The crane equipment includes two 15-ton traveling cranes in the central bay and one 3-ton electric traveling crane in the side bay. Both of these cranes run the entire length of the shop. Two gib-column cranes of 2000-ton capacity are in the core-room.

The iron foundry is equipped with No. 3, No. 5, and No. 7 Whiting cupolas, having a capacity in excess of 150,000 lb. per heat. The air-blast is furnished by three Westinghouse centrifugal air-compressors with a capacity of 19,200 cu. ft. per minute. The amount of air is registered by two Clark blast-meters. Cinders and foundry waste are handled by a Link-Belt elevator-hoist to the disposal yard.

Castings leave the chipping-room on cars, cross a set of scales, and are delivered to the machine-shop casting-yard or loading-dock. The charging-floor is built of steel and concrete, covered with square wooden blocks set on end and wedged with asphaltum. Circulation of fresh cool air, combined with good light and plenty of room, make a perfect charging-floor.

In the iron and coke yards, which are on a level with the charging-floor, are concrete bins for storing molding-sand, pig-iron, and scrap. All material in the material yard is handled with a 20-ton electric locomotive crane, equipped with magnet. This crane does all the unloading

THE POWER-PLANT OF THE UTAH COPPER COMPANY

of material, handles the drop at the breaking-pit, and also handles the large boats into which the coke is loaded for delivery to the charging-floor.

The brass foundry is placed in a building separate from the iron foundry and is equipped with three oil-fired blast-furnaces, with a total capacity of 9000 lb. per day. Brass castings vary in size from a few ounces to 800 lb., and in quality from yellow brass to the best grade of bronze.

In both the iron and brass foundry castings are made by hand-molding, but most of the work is done by molding-machines of the latest type. Castings are not only made for the mills and mines and railroads of the Utah Copper company, but special machinery is made for the other associated companies. The production of castings has increased from a few thousand pounds per month in 1910 to 1,800,000 lb. per month in October, 1917. Up to January 1, 1919, there has been produced 70,000,000 lb. of castings. The working force in this department reached its maximum in October, 1917, when 240 men were employed.

The pattern-storage building is 126 ft. long, 64 ft. wide, and 41 ft. high; it consists of three floors equipped with pattern-racks. It is modern in every respect and approximately 10,000 patterns are kept in storage.

THE MACHINE-SHOP lies between the foundry on the east and the mill-building on the west. It is of timber and frame construction, 320 ft. long, 44 ft. wide, and 35 ft. high. The noteworthy feature of this building is its lighting arrangement, the entire structure being enclosed by continuous windows, which can be opened, thus giving perfect ventilation. The machine-shop floor is on the same level as the foundry. Castings from the foundry are either delivered direct into the machine-shop by service cars or are stored in the stock-yards and delivered to the machine-shop as required. At the west end of the shop are service-tracks connecting with the erecting or rigging sheds of the mill. Over these tracks is a 25-ton crane for handling castings direct into the plant or loading them on cars for shipment to the various plants. The heavy machine-tools of the Utah Copper company are in this shop, it being the intention to concentrate the heavy machining of all castings at this plant and then distribute them to the other plants as required. Approximately 75% of all machinery used in the construction and remodeling of the plants has been designed and fabricated in this shop. Machine-tool equipment is of the highest class and latest design, driven by individual motors. A clear aisle or runway space is provided through the shop. There are two electric overhead cranes, one of 10-ton and the other of 5-ton capacity. These cranes span the width of the shop and travel its length.

The blacksmith and boiler shops are under one roof, being an extension of the warehouse building. The floor of these shops is 10 ft. below that of the machine-shop. For the handling of heavy bar-iron and steel plate, there is a 5-ton hand-operated crane running the full length of the shops. Both shops are equipped with modern tools capable of doing the most complicated class of work.

War-Time Coal and Coke

The coal bill was of dominating interest in the United States and elsewhere during the War, and it still commands wide attention. Studies of the prices of coal and coke from 1913 to 1918 were made by C. E. Leshner, of the U. S. Geological Survey, in co-operation with the United States Fuel Administration and the War Industries Board, and their results have just been published by the Survey as an advance chapter of its report on the mineral resources of the United States in 1918. Mr. Leshner's report shows that 80% of the bituminous coal produced in the United States goes to the railroads, public utilities, and manufacturing industries, which, taken together, represent a market that is little affected by seasonal changes, but that is subject to all the vicissitudes of business conditions—in prosperous and in dull times—that mark the ebb and flow of our industrial life. Of the remaining 20%, 4% represents exports—an item so small and local as to have no effect on the total—and about 16% is taken by domestic consumers, whose use of coal is of course seasonal. Bituminous coal is not stored except by the consumer, but moves directly from mine to user.

Conditions in 1917 and in the first nine months of 1918 were quite different from those in preceding years; demand generally exceeded supply and transportation was the principal factor limiting production. The general principles governing the prices in normal times continued to operate through 1916 and until the middle of 1917, although in the later part of this period conditions were far from normal. A tremendous increase in demand, which began in the last quarter of 1916 and extended through 1918 until the armistice was declared in November, brought forth an increase in production to a point where the limit of railroad capacity was temporarily reached with the demand still unsatisfied. Because the demand could not be fully satisfied, prices in the fall of 1916 and in 1917 rose to almost unheard-of figures, until first voluntary control and later Government control was exercised.

The history of the production of bituminous coal in the United States is a history of the growth of its manufacturing and other industries, but the history of the production of anthracite coal, nearly all of which has been mined in Pennsylvania, is conjoined with the history of the growth of population, for it is the fuel of the household. The anthracite mined in Pennsylvania amounts to only 15% of the coal produced in the country. The demand for anthracite of prepared sizes—egg, stove, chestnut, pea—represents 60% of the total output. For many years anthracite has been sold at a reduced price in summer to encourage its purchase and storage by the householder, and though these summer reductions are not accompanied by a reduction in the wage of the miners, the mining companies have found them very beneficial to the industry, because they permit more uniform operation of the mines throughout the year. The larger companies issue regular circulars giving prices.

Selling-Prices of Mining Machinery Since 1913, with Accompanying Costs of Production

By A. S. BREakey

Not long ago the question arose as to the increase in the cost of mining machinery over pre-War prices, that is, since 1913. A short investigation proved that no such figures could be found; either they had not been compiled, or else such compilations as had been made were kept for private use. Accordingly I collected all the in-

at 100%. It will be observed that, although the cost of materials increased to 280% of the 1913 average, and labor rose to 190% with no present indication of stopping, the selling-price of machinery increased only to a maximum of 195.7%, with a decided drop so far in 1919. In these days of profiteers it is refreshing to discover at

formation available, including the costs of labor, metals, and the principal materials used in manufacturing such machinery, and made the accompanying chart. The machinery prices are an average of twelve standard appliances in use in mining and metallurgy, and were obtained from the leading manufacturers. The other costs were obtained from published quotations, supplemented by statements of the leading manufacturers.

In each case the costs for 1913 were taken as the base

least one industry to which no such stigma can be attached. In addition, the manufacturers were handicapped by a decrease in the efficiency of labor as the wages increased.

Neither freight-charges nor overhead are included in costs. Both of these have increased appreciably, although not in the same proportion as the other items.

The metals whose selling-prices were averaged were copper, iron, steel, lead, spelter, antimony, and tin.

The Mackenzie River Basin, Canada

By F. H. MASON

An exceedingly interesting memoir has been published recently by the Canadian Geological Survey, entitled 'The Mackenzie River Basin' by Charles Camsell and Wyatt Malcolm. It is a compilation from books, pamphlets, and articles that have been published on the region since Samuel Hearne's narrative of his journey from Prince of Wales Fort to the northern ocean during 1769 to 1772—published in 1796—up to the present time; and it is enriched by Mr. Camsell's personal observations during his long residence in the region.

The Mackenzie is the second largest river on the North American continent. It is 2525 miles long; its basin has an area of 682,000 square miles and includes the northern part of the Provinces of Saskatchewan, Alberta, and British Columbia, the western part of the Northwest Territories, and south-eastern and south-western Yukon. It crosses 16 degrees of latitude, 53rd to 69th, and 36 degrees of longitude, 104th to 140th west.

The memoir gives the history and bibliography of the region, and describes the rivers, lakes, agriculture, fauna, timber, transportation facilities, commercial possibilities, inhabitants, and general and economic geology of the explored parts. It comes with particular interest at the present time, when a number of geological parties are in part of the region exploring for oil, and when several big oil companies are attempting to obtain concessions from the provincial and dominion governments for exclusive oil rights over large areas of territory, as it gives an excellent description of the bituminous sand on the Athabaska river and its tributaries, and of such exploration for oil as has been conducted up to the present. It thus puts the layman *au fait* with existing conditions and giving him the opportunity of forming an opinion as to the advisability of the respective governments granting or denying the concessions requested.

It is generally supposed that the immense area of bituminous sand—estimated by S. G. Ellis, of the Department of Mines, at probably not less, and possibly much more, than 750 square miles—exposed on the banks of the Athabaska river and its tributaries and in other places, is an oil residuum saturating the sand, the lighter hydrocarbons having evaporated and the residuum having undergone a certain amount of oxidation. Assuming this theory to be correct, the question arises whether the overflow that escaped either through natural channels or a permeable stratum has exhausted the underground accumulation of oil, or whether there is still a large reservoir of oil somewhere below. To answer this question the governments, companies, and individuals at the present time have representatives in the northern parts of British Columbia and Alberta.

Besides the large area of bituminous sand on the Athabaska and its tributaries, isolated patches of similar material have been found over a wide area of northern Alberta. Detached pieces, weighing five to eight tons, were found on the west side of Buffalo lake, in Saskatchewan, but the deposit from which they came could not be found. The bitumen content of the sand varies from a small percentage up to saturation, and in some places the bitumen is found in pools, having separated from the sand during hot weather and collected in depressions near-by. Up to the present no means has been devised of commercially separating the bitumen from the sand, and until this can be accomplished the material is of only local value. A portion of Kinnaird street, Edmonton, was laid with a pavement made from the Athabaska sand in 1915, and it is still in perfect condition, but, as the average bitumen content of the sand is 15% and as a bitulithic paving calls for 8 to 10%, it will be seen that for street-paving purposes the sand can have only local application. Its present use seems limited to the indication of better things below.

Other indications of oil and gas are found over a wide area of the region, principally in the sediments of Cretaceous and Devonian age. A spring of natural gas is situated at Tar island on Peace river about 25 miles below Peace River Crossing. The gas rises with salt water and some tar from among the gravel and boulders at the upper end of the island. The flow of gas was roughly calculated at 3 to 4 cu. ft. per minute. On Peace river and around Lesser Slave lake bitumen has been found in a number of places filling cracks in nodules, and a bitumen spring is reported near the mouth of Martin river on Lesser Slave lake. Franklin mentioned having observed a bituminous liquid trickling down a steep cliff on the north-west part of Garry island, at the mouth of the Mackenzie. Gas springs are numerous. The most important occur at the mouth of Little Buffalo river, a tributary of the Athabaska. The gas issues from the surface in numerous small jets, distributed over an area of 50 ft. or more in diameter. Some of the jets burn steadily when lighted, and give sufficient heat to cook a camp meal. Jets of escaping gas have been noted at many points on the Athabaska river.

To test the theory that oil would be found below the bituminous sands the Dominion government bored two wells. The one at Athabaska was sunk to a depth of 1770 ft., mostly through shale with occasional layers of sandstone. Several heavy flows of gas were struck, but no oil was found. The second well was sunk near Pelican river during the summers of 1897 and 1898. The following account is given: "The bituminous sands were met at a depth of 750 ft. They were found to consist of soft sand-

THE MACKENZIE RIVER BASIN

stone saturated with bitumen. Strong flows of gas were struck, and at 820 ft. a tremendous flow was struck, the roaring of which could be heard at a distance of three miles or more. The flow was so strong that no progress could be made with the drilling, and work was abandoned until 1898, when it was thought the force of the gas would be decreased sufficiently to permit further operations. But though there was a seeming decrease of pressure, upon operations being resumed in 1898 the seeming decrease was found to be in a great measure due

to the closing of the outlet at the bottom of the casing by an asphalt-like mixture composed of maltha or petroleum tar and sand. In fact, when boring operations were resumed on June 17, the difficulty was found to be intensified by the accumulation of asphalt-like maltha in the bottom of the bore. The rapid expansion of gas produced a very low temperature, and this chilled and solidified the tar, or maltha, until it became as adhesive as wax. As the tools cut it loose the gas would carry it up through the bore, until from top to bottom it was almost

one mass of tar and sand. The only way it could be extracted from the sand-pump was by heating the latter over a fire; even then very little could be got out at one time, it being so thick that it was almost impossible to force it up into the pump. . . . By using a smaller casing the hole was carried to a depth of 837 ft., when another flow of gas was met, nearly equal in volume to that at 820 ft., and the work was stopped."

At Great Slave lake stratigraphic studies have shown a gentle anticline stretching across the lake from Pine point on the south shore to Nintsi (windy) point on the north shore. On Buffalo river and on Hay river above the falls structural conditions suggestive of gentle anticlinal folding are noticeable in the limestone outcrops. Exposures are confined to the valley floors where the rivers have cut down into the Devonian sediments.

Thus it will be seen that, although the results so far obtained have not been over-encouraging, the field is so vast and the reward for success so great that the region would seem to warrant the attention it is receiving.

Turning to the nickel outlook, considerable excitement was caused by the discovery of nickeliferous sulphides in 1914 at the east end of Athabaska lake. The geology of this region has been studied by J. B. Tyrrell and F. J. Alcock, and in 1915 Charles Camsell made an examination of the claims that had been staked for nickel. Norite, which is the nickel-bearing rock in the Sudbury region, occupies the area between the gneiss and the sandstone on the north side of the lake. It extends from the mouth of the Robillard river to the east end of the lake. It is distinctly foliated, and is cut by many small irregular veins of quartz. Practically all the claims that have been staked are in the norite, and, with the exception of the contact phase of the sandstone and some of the dark bands in the gneiss, this is the only formation that shows any evidence of important mineralization. Bunches of weathered ore are found at wide intervals, the minerals consisting of pyrrhotite, chalcopyrite, arsenopyrite, and pyrite. The sulphides are not massive. They are isolated from each other, but by following the strike of the foliation of the norite another body may be found several hundred feet away. Quartz stringers, two to six inches wide, cross-cut the formation, and in these the principal sulphide is arsenopyrite. Sometimes pyrite, galena, and specularite also occur. Deposits of this character are found in several places in the belt of norite lying between Sucker bay and North bay and extending along the strike of the norite from the islands about channel point north-eastward for several miles inland. The sulphides contain nickel and copper, and platinum is reported to have been found, but up to the present the metal content invariably has been low, and, unless more important discoveries are made, the remoteness of the district from railway transportation and from centres of population and the present undeveloped state of the surrounding country seem to make the exploitation of these deposits impracticable at the present time.

Like oil, nickel, it will be seen, has so far been discovered only in small quantities in this region. The only mineral that occurs in really important quantities is coal.

Coal is found in the Cretaceous formation in the southern part of the basin and in the Tertiary in the northern. It occurs as lignite, bituminous coal, and semi-anthracite. The seams range from a few inches up to thirty feet in thickness. A colliery is being developed at Telkwa and is supplying the Grand Trunk Pacific railway. This is using coal instead of oil on all trains east of Prince George. Exposures of high-grade bituminous coal occur on the banks of Hay river, Smoky river, Sheep creek, and other streams, and a seven-foot seam of semi-anthracite is exposed on Smoky river. Two to three-foot seams of lignite occur in the McMurry sandstones, and numerous thin seams of lignite have been found in Peace River canyon. A 30-ft. seam of lignite is reported by Camsell on Bonnet Plume river, in the Peel River basin. Several seams, running from two to nine feet, are reported by Joseph Keele to occur on the Mackenzie at the mouth of the Great Bear river, and MacFarlane reports coal resting on limestone at the junction of the Lockhart and Iroquois rivers.

THE MOVEMENT for Federal endowment of engineering and industrial research was revived early in the present Congress by the introduction of two bills into the Senate. The first bill provides for the establishment of an engineering experiment station in each State under the direction of and in connection with some university, engineering school, or land-grant college. The State legislature of each State is authorized to designate the institution best equipped to conduct the work, but wherever the land-grant college has facilities approximately equal to those of the other institutions of the State, it shall be designated. All designations of institutions are made subject to the approval of the Secretary of Commerce. He is authorized to secure practical uniformity of methods, and efficient and economical expenditure of funds by indicating such lines of work as shall seem to him important from a military, naval, industrial, or national standpoint; but the responsibility for the initiation and conduct of research shall rest with the individual engineering experiment stations. The second bill sets up the Secretary of Commerce and the National Research Council as a 'National Board on Engineering and Industrial Research', which shall appoint in each State and territory a State research board to consist of five engineers or scientists. It shall be the duty of each State board to supervise and control all engineering and industrial research undertaken under the provisions of the Act, which shall include among other subjects those having to do with engineering, chemical, physical, and economic problems connected with water supply, sewage treatment and disposal, industrial wastes, flood protection, drainage and irrigation of land, transportation of property and persons, public lighting and heating, power development and manufacturing processes. Each State board shall utilize such laboratories, equipment, and individuals as may be available in connection with any institution of learning within the State or territory, but before authorizing any investigations report shall be made to the Secretary of Commerce and authority to proceed shall be secured from the national board.

The New Elmore Process

*The new process invented by F. E. Elmore for dealing with mixed sulphides is described in his British patents 6546 and 11,348 of 1917, consolidated into patent 127,641. The patent has been acquired by the Chemical & Metallurgical Corporation, which has a nominal capital of £1,200,000 divided into 200,000 8% cumulative preferred shares and 1,000,000 ordinary shares of £1 each. The chairman of the company is Mr. Herbert Guedalla, of the Imperial & Foreign Corporation, and he is supported by a number of men honorably prominent in mining affairs, namely, Messrs. A. Stanley Elmore (brother of the inventor), J. A. Agnew, F. W. Baker, H. F. Marriott, and Walter McDermott, who has been a strong supporter of the Elmore brothers in their oil-flotation business. Details of the process, extracted from the complete specification, are given in the following paragraphs.

This invention relates to the extraction and separation of lead and zinc from ores, concentrates, and the like, in which these metals exist associated together in the form of sulphides. The invention consists in treating the ore, concentrates, or the like with certain acid agents whereby the lead sulphide is converted into a soluble lead compound while the zinc sulphide remains substantially unattacked. The acid agents in question are sulphuric acid alone or a solution of a suitable salt to which has been added either sulphuric acid, hydrochloric acid, or an alkali bisulphate. Suitable salts are sodium chloride, ammonium chloride, or other halogen salt (other than that of a heavy metal) capable like these of acting in solution as a solvent of lead sulphate or chloride.

If finely ground galena be heated at about 100°C. with concentrated sulphuric acid (specific gravity about 1.84), the sulphide of lead is converted into sulphate. With proper adjustment of conditions, such as fineness of grinding, proportion of sulphuric acid, temperature, and time of contact, substantially the whole of the sulphide can be converted into sulphate. The latter compound may then be dissolved, for instance in a hot saturated solution of sodium chloride, and thus separated from any insoluble matter. On the other hand, if zinc-blende be heated with the concentrated acid at a temperature of about 100°C., only a relatively small amount of the zinc is converted into sulphate, the major portion remaining insoluble in hot brine. If, therefore, the two sulphides be present in an ore or concentrate the lead and zinc may be separated in this manner.

According to one form of the invention the finely ground ore containing the sulphides of lead and zinc is heated with a sufficient quantity of concentrated sulphuric acid at a temperature of about 100°C., until substantially the whole of the lead has been converted into

sulphate. The product is washed once or twice with water to remove practically the whole of any remaining free acid, and to the residue is added a hot, strong, preferably saturated solution of sodium chloride. The sulphate of lead dissolves readily in the hot brine and may be separated by filtration, decantation, or otherwise from the undissolved matter containing the zinc sulphide. The hot brine is then cooled, whereupon any excess of lead salt over that which the cooled brine can hold in solution will be precipitated and can be collected for use in any known manner, while the brine is reheated to be used again. The brine may thus remain in circulation in the process.

EXAMPLE I. A lead-zinc sulphide ore from Burma containing 23% of lead and 40.5% of zinc is ground to pass through a 60-mesh standard sieve. Twenty kilogrammes of the powder are mixed with 20 litres of sulphuric acid of 1.84 specific gravity in a lead-lined steam-heated vessel, and the mixture is heated at about 100°C., until the evolution of sulphur di-oxide has practically ceased. Water is now run into the vessel, the mixture well stirred and allowed to settle; the water is run off, and this washing operation once repeated. One hundred litres of a saturated solution of common salt are now run into the vessel, the contents of which are well stirred and maintained at 100°C. for, say, half an hour, whereupon the undissolved matter is allowed to settle and the hot solution run into a cooling-vat in which a mixture of lead sulphate and chloride separates from the liquid and may be collected for metallurgical treatment. The residue in the heating-vessel may be washed first with brine and then with water, if desired, and metallurgically treated for recovery of zinc.

If, instead of sulphuric acid of 1.84 specific gravity, a less concentrated acid be employed, the lead can be converted into lead sulphate, but a larger proportion of the zinc may be in this case converted into zinc sulphate. In deciding whether to use concentrated or weaker acid, practical considerations such as the value of zinc and the cost of the different grades of acid must be taken into account. On using concentrated acid or somewhat weaker acid, the reaction upon the lead sulphide is accompanied by an evolution of sulphur di-oxide and the production of free sulphur. With still weaker acids, however, the reaction is accompanied mainly by the evolution of sulphuretted hydrogen. In whatever form sulphur is liberated, it may be used in the known manner for producing sulphuric acid. By working separate batches with strong and weak acids respectively, it is possible, as an alternative to using the sulphur di-oxide and sulphuretted hydrogen directly in the known manner for the production of sulphur or sulphuric acid, to lead the sulphur di-oxide liberated from the strong-acid

*Abstracted from the August issue of 'The Mining Magazine'.

batch into the weak-acid batch, whereby the objectionable emission of both sulphur di-oxide and sulphuretted hydrogen may be largely abated.

According to another form of the invention, the finely subdivided ore is treated with an acid in presence of a salt, such as sodium chloride. A weaker acid may then be used. Thus, the finely subdivided ore may be treated with hot strong brine to which sulphuric acid has been added.

EXAMPLE II. Twenty kilogrammes of the ore referred to in Example I, crushed to pass through a 100-mesh standard sieve, are stirred in an earthenware steam-heated vessel with 100 litres of a saturated solution of common salt and the mixture is heated to about 85°C. Six litres of sulphuric acid of 1.84 specific gravity are gradually run into the vessel, the heating being continued. The lead sulphide is attacked, the lead passing into solution, while the zinc sulphide remains substantially insoluble. When the evolution of sulphuretted hydrogen has practically ceased, the hot brine is separated from the insoluble matter and is run into a cooling vat, where it deposits lead salt; it may be re-heated to be used again.

When the acid agent is hydrochloric acid in presence of a suitable salt solution, lead chloride is formed and sulphur is evolved in the form of sulphuretted hydrogen.

EXAMPLE III. Twenty kilogrammes of the finely subdivided ore referred to in Example I are stirred in an earthenware steam-heated vessel with 65 litres of a saturated solution of common salt, the mixture being heated to about 80°C. Eighteen litres of hydrochloric acid of specific gravity 1.11 are now run in, and stirring and heating continued until evolution of sulphuretted hydrogen has practically ceased. After settling, the hot brine is run into a cooling-vat where the lead compound crystallizes. The brine may be used again.

EXAMPLE IV. Twenty kilogrammes of Broken Hill concentrate containing 44.2% of zinc and 9.2% of lead, and capable of passing through a 30-mesh standard sieve, are mixed in an earthenware steam-heated vessel with 120 litres of a saturated solution of common salt to which 27 kilo. of sodium bisulphate (NaHSO_4) have been added. The mixture is boiled until the evolution of sulphuretted hydrogen has practically ceased. The hot brine is then separated from the insoluble matter and is run into a cooling-vat where it deposits lead salt; it may then be re-heated to be used again.

If it is more convenient under local conditions to smelt lead sulphate than lead chloride, it is preferable to convert the latter into sulphate by heating it with strong sulphuric acid, whereby hydrochloric acid gas is evolved; this is absorbed in water or in brine in such manner as to form either a strong aqueous solution of acid or a solution of the acid in brine. The aqueous solution may be mixed with brine to render it suitable for treating a further batch of ore; the solution of the acid in brine is already suitable for this purpose.

The lead sulphate, whether made directly from the ore or from the chloride, may be mixed with lead sulphide

and smelted in known manner, and the lead sulphide, or a part of it, necessary for the purpose may be made by utilizing the sulphuretted hydrogen from the treatment of the ore with hydrochloric acid and a salt solution.

The following are the claims:

1. The treatment of lead-zinc sulphide ores, concentrates, and the like, consisting in treating the ore with an acid agent as herein defined, whereby the lead sulphide is converted into a soluble lead compound while the zinc sulphide remains substantially unattacked.

2. The treatment of lead-zinc sulphide ores, concentrates, and the like, consisting in heating the ore with strong sulphuric acid at about 100°C. until substantially all the lead sulphide has been converted into lead sulphate, dissolving the latter with a hot strong solution of sodium chloride or other suitable halogen salt, separating the hot solution from the unattacked zinc sulphide, and cooling the solution to cause a partial crystallization of lead salt.

3. The treatment of lead-zinc sulphide ores, concentrates, and the like, consisting in heating the ore with a strong solution of sodium chloride or other suitable halogen salt to which a sufficient quantity of sulphuric or hydrochloric acid or an alkali bisulphate is added, whereby the lead is caused to pass into solution while the zinc sulphide remains substantially unattacked, separating the hot solution from the zinc sulphide by filtration, decantation, or the like, and cooling the solution to cause a partial crystallization of lead salt.

4. In the herein described treatment of lead-zinc sulphide ores, concentrates, and the like, for the separation of the lead from the zinc, heating a mixture of one portion of the ore with sulphuric acid of a strength adapted to evolve sulphur di-oxide, heating a mixture of another portion of the ore with acid adapted to evolve sulphuretted hydrogen, and passing the gases evolved from the first mixture into the second, substantially as and for the purpose described.

5. In the herein described treatment of lead-zinc sulphide ores, concentrates, and the like, in which the lead compound produced contains or consists of lead chloride, heating the said compound with strong sulphuric acid and absorbing in water or brine the hydrochloric acid gas evolved, substantially as and for the purpose described.

6. Smelting the lead sulphate produced by the treatment referred to in Claim 5 with lead sulphide so as to produce metallic lead.

7. The treatment of lead-zinc sulphide ores, concentrates, and the like, consisting in heating the ore with an acid agent as herein defined, which converts the lead sulphide into a soluble compound while substantially not attacking the zinc sulphide and causes evolution of sulphuretted hydrogen, utilizing the sulphuretted hydrogen to make lead sulphide from the soluble lead compound, and smelting the lead sulphide together with lead sulphate so as to produce metallic lead.

8. The treatments of lead-zinc sulphide ores described in the several examples herein.

REVIEW OF MINING

ARIZONA

GENERAL NEWS OF THE STATE.

CLIFTON.—A special meeting of stockholders of the Shannon Copper Co. was called for September 24 to decide whether the property should be sold to the Arizona Copper Co., under terms of an offer made by the latter corporation. The Shannon ceased operation in all divisions several months ago. The resolution to be voted upon authorized the sale of all shares in the copper property at Clifton, the Shannon Arizona Railway Co., Clifton Northern Railway Co., and Colorado Mining Company.

TUCSON.—Fuel-oil burners of Arizona, including representatives of all the large mining corporations in the State, met here September 19 to protest against any increase in rail-rate upon fuel oil from the Texas fields, which is considered in order to equalize the rate from California. The argument of the consumers was that California companies find themselves unable to keep up with the demand, while Texas, with its new wells, is in a position to do so easily. The members of the State Corporation Commission, the rate-fixing body, were in attendance. Decision was reserved. If present rates on Texas oil can be maintained, a saving of millions of dollars annually will be possible, according to mining men.

WILCOX.—The Central Mining Co. has been organized to work a group of sixteen claims, 18 miles west of this place, in the Dos Cabezas district, and adjoining the Mascot company, which last year was an important producer. The surface showing on the property is exceptionally good. E. A. Ely is in charge of the work. The Central Copper property is served by the branch of the Southern Pacific railroad that was built several years ago to serve the Mascot. Los Angeles interests recently acquired a bond and lease on the Dives group in the same vicinity and development work has been started on a moderate scale. John Welty is operating a small mill on the Bane mine with good results. The Sunset group has been bonded to Montana interests which are reported to be planning extensive development.

GLOBE.—The Miami Copper Co. has received its new electric hoist for its No. 5 shaft and erection has been started. The shaft-house, head-frame, and retaining-wall are well under way. The new hoist is of the geared type, 250-hp. motor, the load being balanced by a 10,000-lb. counterweight. Production of the mine and mill is about two-thirds capacity. Sinking the shaft at the Van Dyke Copper Co.'s mine continues at the rate of about four feet daily. It is the intention of the management

to sink 1300 ft. before starting lateral development. This should put the shaft through the orebody at the northern end of the property, which was discovered by drilling at the approximate depth of 1170 ft. Exploration of this body from the 1300-ft. level is planned. The new concentrator of the Gibson Consolidated now is milling approximately 100 tons of ore daily. The company has ordered a thickener for the more efficient reclamation of water. As soon as the thickener is installed a third shift will be put to work. Ore from the dump to the mill is being handled from the surface, instead of being run down raises to pockets and then hoisted through the main shaft as originally planned. This scheme has been found more economical. Regular shipments of six carloads of concentrates daily are being maintained. The International smelter recently blew in its third reverberatory furnace and now has a production of 300 tons of copper matte per day. The last of the surplus stock of copper accumulated since the Armistice was shipped early in the month and marks the cleaning up of surplus stock of copper in the district. The smelter is gradually constructing its new dumping-ground for the disposal of slag. Grading and track laying as well as building a high fence along the highway have been completed. The new dump will afford facilities for twenty years, and also will eliminate danger due to dumping slag on unconsolidated tailing, which is the present practice.

Churn-drill operations at the Castle Dome have been hampered by the breakage of drilling tools in No. 6 hole, due to the exceptional hardness of the strata. The new equipment of the Iron Cap is in successful operation. This includes a hoist and conveying system. The hoist, 250-hp. electrically-driven, is able to handle 400 mine cars of ore in five hours, or at the rate of 80 tons per hour. Shipments of low-grade copper, averaging 5%, are being made to the International smelter, while 8% ore or better is being shipped to the smelter at El Paso.

JEROME.—Fifty feet of schist, impregnated with pyrite and some chalcopyrite, has been cut by the diamond-drill operating on the 500-ft. level of the Pittsburg-Jerome. The farther wall has not been reached. While no ore has been struck, the showing is considered highly encouraging by Richard L. Smith, consulting engineer, who has been inspecting the property. The hole is a flat one, being drilled south and west from the 500-ft. level into territory never before penetrated. Probably steps will be taken to run a cross-cut from the lowest level to intersect the schist located by the drill. The cross-cut would intercept the ore 450 ft. below the hole. Cores from the drill-hole are said to be identical with the for-

mation now being developed at the Verde Combination.

NOGALES.—Charles M. Schwab is reported to have bought the mineral rights of the Baca Float, including some exceedingly rich resources developed by old mines not now working. Mr. Schwab is not a newcomer in the South-West, as he has a number of profitable investments, including a property in Mexico, across the line from Hachita, New Mexico. Louis J. Merritt of Pasadena, California, is inspecting the Tres de Mayo mine, owned and operated by the Bachmann-Merritt Mines Co., of which he is vice-president. He is accompanied by O. B. Bachmann, who is devoting considerable time to direction of the company operations. A 12-ft. vein of vanadium, said to carry approximately 25%, has been discovered on the property. Paralleling the vanadium is a vein of silver ore stated to be worth \$50 per ton. Arrangements are being made for the shipment of vanadium to Eastern points and it is probable arrangements will be made soon for the concentration of the silver ore.

CALIFORNIA

GRASS VALLEY, NEVADA CITY, SIERRA COUNTY.

GRASS VALLEY.—Owners of lands in the Alta Hill district, north-west of the city, are finding a ready sale for their mineral rights. Roy King, a mining engineer, said to represent Tonopah interests, is securing the options by making a small cash payment, which will be followed with a larger one next year. This district was famous in the early days for its placer gold but has been practically idle for many years. No veins appear on the surface and hope of future mining is simply based on geological conditions. A tunnel of considerable length that was driven years ago will be extended into the hill. Recently the Highway Mining Co., operating on the Morandi tract near town, uncovered a vein of quartz from 8 to 10 in. wide showing gold. Prospecting still continues. A satisfactory test of the pumping machinery of the Idaho-Maryland was made recently. A Cornish pump will be used until the complete electrical installation arrives. This shaft is 1000 ft. deep and unwatering will require a long time.

NEVADA CITY.—After years of persistent effort gravel was found recently in the Lost Channel claim near Banner. The tunnel is in over 200 ft. G. M. Hoff and others hold a bond from the Ahern brothers. On the theory of an old miner that the ground should contain gravel, tunnels have been run for years on both sides of the ridge. This is the first proof of the correctness of the theory. Information of a rich and extensive find of ore in the Champion mine has just reached the public. While the full extent of the body is not yet known, the promise is made that should it extend to a lower level the company will make improvements in proportion to its value, one of which will be sinking the main shaft 1000 ft. The find is the most important in years and comes most opportunely, for the Champion has been on the verge of closing down for a long time—the last during the threatened strike in June. Although no figures of tonnage or grade have been made public, enough is known to en-

courage the owners in their belief that years of prospecting are about to be rewarded.

SIERRA COUNTY.—The Columbia quartz mines near Ormonde have closed down because of the difficulty in keeping a full crew. J. L. Whitney is superintendent.

PLACER COUNTY.—Preparations are being made to continue operations all winter at the Canada Hill mines. They are at an elevation of 5500 ft. Buildings are being erected to withstand the snows. The management is in charge of H. J. Snyder, who has spent several years in consolidating some fifteen claims, all of which were turned over to the Metals Exploration Co. of New York. While the claims have been but little developed from the surface, a number of promising veins run through the property. A long tunnel will be run to intersect them and prove their value.

GRANITEVILLE.—Cushman and Adams of San Francisco have a bond from Samuel Colt on the Spotswood quartz claim and in driving the continuation of an old adit made an important discovery a few days ago. The ore was stated to be liberally sprinkled with gold. Whether the discovery was merely a pocket or will lead to an orebody is not yet known.

COLORADO

TELLURIDE AND RICO.

TELLURIDE.—A shortage of miners continues, and 300 to 400 men are needed to carry out prospective developments. Although shipments from the district are not heavy for this time of year, there is no doubt that production during the coming year will be substantially increased. The Silver Canon Mining Co. has opened up a good vein of silver-lead ore, in the Shamus O'Brien, 18 in. wide, with a fine showing of native silver and gray copper. The workings are being re-timbered, and the operators are getting the mine into condition as a producer. One of the most interesting haulage feats undertaken by the Telluride Transfer Co., which makes a specialty of such operations, is the transfer of a ball-mill from the railroad to the new flotation plant of the Tomboy Gold Mines Co. The mill is 9½ ft. in diameter and weighs about 9 tons. Six horses pulled, and four were hitched to a push pole at the rear of the wagon. Three days time was required to cover the entire distance, the road being in an especially unfavorable condition and very muddy. Often the truck was buried to the axles. The Japan-Flora Mines & Tunnel is involved in litigation, owing to a suit being brought by the Lawrence Savings & Trust Co., of New Castle, Pennsylvania, to recover payment due on principal, bond, and interest, due as underwriters for a bond issue. The amount is \$300,000. The Matterhorn company has started a mill-run on the Dewey ore, at the Butterfly mill, and will start shipments of concentrate at an early date. The product is expected to be similar to the Old Butterfly-Terrible concentrate, which carried considerable iron and high gold and silver. There is a report to the effect that the Liberty Bell Gold Mining Co. is about to close down. Up to the present time no confirmation of this report has

been received. During August a few cars of clean-up were shipped. A mill will be built at the New Dominion mine situated at Ophir. The Gold Run Mining Co. has been organized to work over the sands of the River Bed at Pandora, to recover metal in the tailing from the Smuggler and Tomboy mills; a mill is already in operation with three shifts under electric power. The new company is capitalized at \$50,000, backed by a strong organization of mining men of the district. The operations of the Valley View Leasing & Mining Co., leasing the San Bernardo, are progressing rapidly. A force of men is at work re-timbering, cleaning out, and widening the tunnels to facilitate the movement of the ore. A tramway from the working tunnel to the mill-site is also being built. While the mill is under construction crude ore will be shipped from Tunnel No. 4, where there is a good body of ore yielding assays as high as \$75 per ton, the ore containing gold, silver, lead, and copper. The ore in the San Bernardo justifies extensive development and a profitable run is forecasted for the new company. The new mill will be three stories in height, size 30 by 50 ft.; the lower floor will accommodate storage-bins and the crushers; the second floor, flotation mills and the grinders; and the top floor Wilfley tables. The tramway from the working tunnel to the mill will move the ore at a minimum cost. Herrington & Co. are cleaning up the old mill of the Smuggler Union, making a good recovery from the tailing and screening. A number of cars of the material have brought the lessees returns of about \$2000 per car, as the material ran over 3 oz. in gold and \$30 in silver. The Smuggler Union has a run of high-grade silver ore on the Humboldt, and is producing a concentrate carrying 350 oz. of silver per ton.

Rico.—Mining operations are going on at more properties than for some years past, and there will probably be a number of producing mines during the winter months. Much development that has been under way for the past year is nearing completion, and some of the operators are already in condition to ship. Owing to a lower grade of ore encountered the Marmatite company has temporarily ceased to ship, after averaging 25 cars monthly during the past 5 months. Development of the Silver Swan continues; work on the Pro Patria is progressing, and the company expects to make shipments of lead and zinc ore at an early date. A good showing of lead-silver ore is reported. The Rico Argentine Mining Co. has resumed operations, and will probably ship during the remainder of the year. A compressor is being installed. Operations on the Premier Claims are progressing; the new tunnel has been driven 110 ft. and is now in the Old Shively workings. The Home tunnel is being opened up and re-timbered. There will be a raise to the upper workings to permit better ventilation. The Rico Wellington Mining Co. is now completing two years of development work and is in readiness to produce a heavy tonnage from the lower workings, but may await a better metal market before starting shipments. A branch tramway from the main tramway to the Mountain Spring tunnel is now under construction, and when completed will facilitate the movement of the ore and

decrease operating costs. Ore will be moved from the lower levels by an elevator hoist. The drive to the Leap Year fissure is nearly completed, and a large body of high copper ore has been developed. The St. Louis and Bancroft claims have been leased to Nutter & Co. The Mediterranean mine is packing out ore to make a car-load shipment. The Syndicate company intends to drive the Potter tunnel an additional 100 ft. Shipments of silver ore have been made and a good vein of lead-zinc ore has been opened. The Schoeto claims are under lease

A VIEW OF THE SMUGGLER UNION MINE, TELLURIDE

to R. L. Pellet. Among the preliminary operations will be re-opening the shaft, and sinking to a sufficient depth to discover whether or not the Newman Hill contact continues south of the Deadwood fault. Emmet Nutter has taken over the Iron Mine group, consisting of the following claims: Iron Mine Lode, Uncertainty, and Lucky Number, in the Pioneer Mining district, under a bond and lease from the owners, Matt Jacobson and Henry Obendorfer. The price of the property is \$15,000. The J. M. Doyle Mining Co. has been organized to develop the property, and extensive operations are now under way. A tunnel is being driven on the Missouri lode to tap the main orebody of the Iron Mine Lode.

MICHIGAN

EFFECT OF STRIKES.—THE METAL SITUATION.—OPERATIONS AT THE MINES.

HOUGHTON.—The steel industry strike did not make any difference in the operation of the copper mines of Michigan and is not likely to. The strike of lake seamen was looked upon as possibly making some trouble for the copper mines, but a careful examination of the situation shows that the copper mines already are supplied with the coal necessary to keep the mines working until next July, a condition applicable to all the larger properties and most of the smaller ones. Mines here import coal by water early in the summer. Of course the steel strike may indirectly have some bearing on the copper industry by creating a further slackening in the demand for the output of mines.

Frankly the metal situation, as viewed from the standpoint of Michigan producers, is not good. There is today 50,000,000 lb. of copper on hand at the docks and in smelter yards. At the Dollar Bay yards of the Lake Superior Smelting Co., owned jointly by the Calumet & Hecla, Isle Royale, and Osceola corporations, there is 12,000,000 lb. of refined metal. The metal has been there since last spring when the plant shut-down. The plant may never be re-opened, because the Calumet & Hecla can handle its entire smelting operations more economically at the main smelter at Hubbell, and it is bad economics to maintain two such plants. The fact that such a large amount of refined copper has not been sold indicates that this company is carrying a substantial amount on hand against the foreign demand that is expected when the peace arrangements are satisfactorily completed. Michigan copper mines are continuing to engage more underground men, but they all are working on new development, preparing for future demand rather than attempting to increase present production.

Geologists generally will be interested in the knowledge that the whole Michigan district is to be given a thorough geological examination under the direction of L. C. Graton. Messrs. Lock, Burns, and Polache of his staff are already on the ground. Practically all mineral development that has been made in this district has resulted from discovery of copper accidentally or from following the extensions of proved veins on adjoining properties. The Calumet conglomerate lode, which has paid more millions than any other copper formation in the world, was found by plain good luck. The original copper deposit was mass stuff, hidden by prehistoric races. When this was removed it was found resting on the outcrop of what is now the Calumet conglomerate. That formation runs for 34 miles, from Calumet to the very end of Keweenaw Point. It was identified in the Clark property, the farthest north point of the peninsula, without copper; in the Delaware property with a little copper; at the Allouez at Ahmeek properties and presumably at the Tecumseh and Franklin without copper. The Calumet & Hecla is now having this geological examination made in order that its future exploratory work may be on a sound foundation of geologic fact, rather than

the haphazard methods that have obtained in the past in so much of the district.

Wolverine operations are now confined to eight levels in the lower limits of shafts 3 and 4, back of the foot-wall. High-grade ore is being hoisted from the lower levels, but the upper level openings are showing only a small profit. The Mayflower shaft is now down 1510 ft. in trap and amygdaloid. Calumet & Hecla is operating two shifts daily on all shafts on the conglomerate lode and on two shafts working on the Osceola amygdaloid. It is reported that the Lake mine may be re-opened in 60 days. The White Pine in Ontonagon county is adding to its working forces regularly. Calumet & Hecla is making a survey of its smelting necessities before determining the extent of remodeling to be done. The experiments with electric smelting of copper have not been satisfactory.

NEVADA

GOLDFIELD DEVELOPMENT CO. TO RE-TIMBER SHAFT.—CONDITIONS ARE PROMISING IN THE SIMON DISTRICT.

GOLDFIELD.—The Goldfield Development Co. will enlarge the main shaft slightly and completely re-timber it from the surface to the 380-ft. level. The timbers will be 10 by 10 in., which will permit increased hoisting speed and add 20% to the capacity of the shaft. This was decided after it had been determined that 150 ft. of the shaft would have to be re-timbered. The Atlanta is repairing and cleaning the 1300-ft. east hanging-wall cross-cut on the 1465-ft. level of the Grizzly Bear shaft. Driving will be started south-east in a seam of low-grade ore near the face of the cross-cut. The Kewanas is driving south on the 700-ft. level in a vein containing low-grade ore. A cross-cut is being driven north-east on the same level. This work is being done in the northern part of the claims. The Blue Bull is cross-cutting east on the 250-ft. level to open the extension of narrow seams of ore found in a raise from this level. The Merger has stopped work through the Spearhead shaft, where the shale-latite contact was being explored from the south drift on the 910-ft. level of the Spearhead. The Merger is now inactive. The south cross-cut on the 815-ft., or bottom level, of the Grandma has entered the shale. One foot of ore assaying \$40 was found on the shale-latite contact and driving has been started at this point. The cross-cut first entered highly silicified shale, fractured and with frequent intrusions of latite, and the primary blue shale was not found until this material had been penetrated for 40 ft. The shale was found dipping east and it is believed to mark the true contact entering the Grandma from the Lone Star and Blue Bull. The Grandma shaft entered a hill of shale and prospecting in all directions from the shaft failed to disclose the shale at another point until it was found in the south cross-cut. Lying on the shale is a mass of quartz 100 ft. thick, known as the Spearhead-Grandma vein, in which the Spearhead has opened small ore-shoots on the upper levels. The \$40 assay secured by the Grandma is the highest ever obtained by this company. The Reorgan-

ized Diamondfield Black Butte Mining Co., which has been inactive for a long period, is to resume work on the claims owned by the company in the Diamondfield district, four miles north of Goldfield. J. K. Turner, consulting engineer, expects to do the first work through the old Dorth lease shaft, where a cross-cut will be driven on the 190-ft. level to open a wide vein striking south-east, the outcrop of which is evident near the black butte from which the name of the company is derived. Many thousands of feet of development work and stoping was done in the Black Butte in the early days of Goldfield, when a good production of high-grade ore was made, both by the company and lessees. The formation in the Diamondfield district is similar to that of Goldfield. The Reorganized Black Butte owns the Orizaba, near Cloverdale.

SIMON DISTRICT.—Walter Harvey Weed recently examined the Simon silver-lead mine and in conversation commented favorably on the mine and the district. Nine hundred feet south-east of the main shaft a vein 22 ft. wide has been opened on the surface and ore has been exposed for this width. A 5-ft. width assays from 40 to 50% lead. This is taken as an indication that the main vein of the district contains ore for a distance of 1000 ft. in the Simon claims. A new gasoline-driven surface plant, capable of hoisting from 1400 ft., has been erected and sinking the shaft an additional 200 ft. from the 400-ft. level is to be started immediately. Drifts and cross-cuts are being driven on the 300 and 400-ft. levels to block out ore and explore the vein farther to the south-east and also into the hanging wall. Ore assaying from \$35 to \$50 at present prices has been found in the 40-ft. shaft of the Simon Fagan, the value being principally in silver and lead, with a small gold content. The Simon Fagan is sinking in the main Simon vein.

WEST DIVIDE.—The north drift of the West Divide Mining Co., at a depth of 60 ft. has been driven 42 ft. and the face is in ore assaying from 50 to 125 oz. silver. At 35 ft. the vein became spotted with lime and this condition continued for 4 ft. The ore is now $3\frac{1}{2}$ ft. wide and is being saved for shipment as soon as the Tonopah-Divide strike situation clears and more men can be put to work. It will be necessary to repair the road to Goldfield before shipments can be started. A drift south has been started in a narrow vein of ore, the same condition that existed when the north drift was started.

MONTEZUMA.—The south drift on the 100-ft. level of the Monitor group of claims has been driven 64 ft., 19 ft. with a full face of silver-lead ore assaying from \$75 to \$100 per ton. The lower half of the drift is in practically solid lead sulphide ore. Ore assaying \$75 has been exposed on the 50-ft. level for a distance of 15 ft. in the same shoot, which extends to the surface.

GOLD MOUNTAIN.—The surface of the claims of the Washington Gold Quartz Mining Co. are being prospected and, according to J. K. Turner, general manager, high assay returns are being secured. A well defined contact between granite and porphyry is being explored and it is believed by Mr. Turner that this will result in a new shaft being sunk on the contact. The former

owners did no work on the contact, but recent work has shown the best possibilities for opening orebodies to be at this point. The ore is lead carbonate and sulphide and contains gold and silver.

BRITISH COLUMBIA

WORK ON THE SNOWSTORM GROUP.—PLANS FOR A RAILROAD TO THE BIG MISSOURI.

ASHCROFT.—The Provincial Department of Mines has decided to undertake some surface work on the Snowstorm group, which is controlled by Stewart Henderson, of Victoria, to facilitate further drilling operations. Ninety tons of ore shipped from this group prior to 1915 gave a smelter return of 36% of copper, and 40.5 tons, won in the sinking of a shaft in 1916, gave smelter returns of 23.7% of copper. Last January, under the Mineral Survey Act of 1918, the Department of Mines let a contract to the Diamond Drilling Co., of Spokane, for 10,000 ft. of drilling on the Snowstorm. Five thousand feet of this work has been finished and has shown such excellent results that the further work has been decided upon, in order that the remainder of the drilling might be carried out to better advantage.

PORTLAND CANAL.—Sir Donald Mann is paying another visit to the Big Missouri, where he will meet in consultation Mr. Bancroft, of McGill University, and F. H. Minard, of New York. A trail is being built to connect with the Stewart-Premier mine trail, so that ore may be taken out this winter, if possible. It is considered not improbable that a railroad will be built from the Big Missouri to Stewart next year. A good tonnage is assured, as the Premier mine alone is said to have developed well over 1,000,000 tons of shipping ore above the bottom level, and, as the orebody at that point is stronger and richer than at the surface, it is reasonable to suppose that there is considerable ore below. The Big Missouri contains an immense body of low-grade ore, as well as some shipping ore, and there are a number of other mines that would contribute. The country is difficult, but Sir Donald is an old railroad campaigner, and, if the freight is assured, will not be easily dismayed by obstacles. Boyle brothers, of Anyox, who have the contract for the diamond-drilling at the Big Missouri, have been given a drilling contract on the Forty-Nine group. J. J. Conner and J. McNeill have bonded their claims on Bear river to G. Sievert, who is representing St. Louis capital, for \$250,000.

SLOCAN.—The new 100-ton mill at the Noble Five mine is nearly completed. Two tunnels are being driven on the Reco group, which was acquired in the spring by James Dunsmuir, owner of the Noble Five, with the view to developing the No. 3 vein. A considerable quantity of ore has been developed on the Last Chance vein. A four-compartment raise has been driven to connect the lower workings and the main adit with the upper workings. The Roseberry-Surprise Mining Co. has struck a new body of silver-lead-zinc ore.

GRAND FORKS.—United States capitalists have taken a 30-day option on the Union mine, in the Franklyn camp.

The consideration is said to be \$300,000. The mine has produced a considerable quantity of ore, running 0.3 to 0.6 oz. in gold and 30 to 50 oz. in silver per ton.

NELSON.—The tunnel at the Queen mine is now in nearly 1500 ft., and it is expected that the Queen vein will be cut in the next 100 ft. A. W. McCune, of Salt Lake City, bonded this property last year. The British Columbia Iron Co. has been incorporated to develop the iron-ore deposits at Bull river.

CARIBOO.—A syndicate of Barkerville people have secured a number of claims on Summit creek, and will start operations at once. J. A. Bryce, of Cobalt, Ontario, is developing some lode-gold claims on Prosperpine mountain.

VICTORIA.—The Pacific Coast Coal Mines, Ltd., has won its appeal in the claim for \$84,000 damages brought against it by the Wellington Colliery, Ltd., and the Canadian Collieries (Dunsmuir) Ltd., in the court of appeals. Justice McPhillips was the only dissenting judge. The Pacific Coast company was charged with trespass for taking coal out of the corner of the Alexander property, belonging to the Wellington company, in the Cranberry district, South Wellington. The corner in question was between the Pacific Coast company's property and an abandoned slope of the Alexander mine. The Pacific Coast company claimed that W. L. Coulston, former manager of the Canadian Collieries and of the Wellington Colliery, had given his permission to take the coal out in consideration of favors and services he had received from the Pacific Coast company, and two witnesses testified to that effect. The plaintiffs relied on the fact that Coulston was dead, and therefore unable to refute the evidence of the witnesses, and for that reason, they claimed, the court should not accept the evidence. The court thought otherwise, and ruled accordingly.

MANITOBA

THE COPPER LAKE GOLD DISCOVERY.

COPPER LAKE.—R. C. Wallace, Commissioner of Northern Manitoba, has issued a report on the Copper Lake goldfield to which much attention has been directed by the discovery of a rich shoot of gold on a property now known as the 'Red Rose'. The shoot appears on the east wall of a vertical quartz vein 18 in. wide and occupies 3 in. of the wall. A pit has been dug 6 ft. deep. The highly sheared and somewhat decomposed greenstone on the east wall of the vein shows very coarse gold in panning across 2½ ft. at the bottom of the pit. The vein has been stripped for 200 ft. and ranges in width from 18 to 6 in. On the adjoining claim to the south, in what is probably the same zone, the folding of a vein 18 in. thick is clearly shown. The importance of the free-gold shoot on the Red Rose is increased by its proximity to a tremendous quartz body yielding low assays in gold. This quartz, which has been prospected over five claims, is well exposed for more than 2000 ft. on the two most northerly claims by cross-trenches varying in width from 15 to 30 ft. The other claims have not yet been sufficiently prospected to determine the extension of the

lode, but on the fourth claim a large vein of quartz and country rock, less than half of which is quartz, is exposed for a width of 100 ft. The total length of the lode cannot be estimated until more work is done on the claims.

ONTARIO

COBALT, PORCUPINE, BOSTON CREEK.

COBALT.—Conditions in this district are rapidly getting back to normal. Last week shipments of ore amounting to over half a million pounds were made by five mines, the Nipissing heading the list and also sending out 200,209 fine oz. of bullion. During July the Nipissing mined ore of an estimated value of \$266,937 and shipped bullion from its own and custom ores of an estimated net value of \$108,617. The McKinley-Darragh during the first seven months of the year realized net earnings almost sufficient to cover the full year's dividend payments of 3% per quarter. It is expected that the end of the year will show a surplus over dividend requirements. A significant feature is that during the first half of the year the cost of production was reduced to 60c. per ounce, as compared with an average cost of over 68c. per ounce in 1918. The share capital of the Kerr Lake has been reduced from \$3,000,000 to \$2,400,000, by reducing the par value of the shares from \$5 to \$4. The old Hylands property situated north of the Ophir will be re-opened. At the Adanac a new vein 3 in. wide carrying leaf silver has been intersected by a cross-cut at the top of a raise from the 310-ft. level. The Nipissing Extension Mines, a recently organized company of which A. J. Young of the Northern Concentrators Co. is president, has taken over the Farah property, on which high-grade ore was discovered in June last. Major E. H. Birkett, recently returned from service overseas, who was formerly a mining engineer at Boise, Idaho, has been appointed manager.

PORCUPINE.—Though labor conditions around Porcupine have considerably improved, production by the leading mines is still limited by a shortage of men. The most important feature of the annual report of the McIntyre for the year ending June 30 is the statement that the ore developed on the 1125-ft. level, now open for 900 ft. has materially enhanced the value per ton of the ore-reserves, which is now \$11, as compared with \$9.80 a year ago. The ore-reserves amount to 433,057 tons valued at \$4,777,324. Gross earnings were \$1,671,646, operating expenses \$825,998, and net profits before providing for depletion of mining properties or war taxes \$683,350, as against \$680,361 for the previous year.

BOSTON CREEK.—Work is being carried on actively by the Boston McCrear company, which has done a large amount of exploration with satisfactory results. Telluride of gold has been discovered in considerable quantity, some of the ore yielding high assays. An electrically-driven mining plant will be installed and sinking operations begun. At the Mondeau some rich ore showing visible gold has been encountered in driving on the 50-ft. level. The property is equipped with a small steam plant.

CALIFORNIA

Amador County.—The Keystone mine at Amador City is concreting the upper portion of the main shaft. For some time past, the settling of the ground around the collar of the shaft has caused trouble. Concrete foundations have been placed under the hoist building, head-frame foundations strengthened, and general repairs made. C. R. Downs of Sutter Creek is superintendent.

Forest Hill.—Oro Fino Mining Co., operating the Orpheum mine near Ophir, has acquired control of the Excelsior-Baltimore gravel property in this district. Haines Gridley, superintendent, has arranged to use electric power in place of steam, and plans to cut operating costs by other changes in equipment. The property is said to contain extensive deposits of medium-grade gravel.

Jackson.—Extensive improvements are under way at the Muldoon mine, which is owned by the Argonaut Mining Co. Although it has been deemed advisable to seal the collar of the shaft and bulkhead the levels connecting the Muldoon with the Argonaut property until the mine fire is extinguished, the hope of making good use of this shaft in the future has evidently not been abandoned. A number of men are engaged in erecting a hoist building and laying concrete foundations for machinery just east of the shaft. The plant heretofore used at the Muldoon mine was out of repair and inadequate for the needs of the mine. With the completion of this improvement, the work of repairing the Muldoon shaft and such portions of the workings as will be found damaged will be greatly facilitated. This shaft forms, when open, a valued adjunct to the Argonaut's ventilation system and a safety exit and it is believed the fire will shortly be smothered out and permit the re-opening of this part of the mine. In the meantime, the work at the Argonaut continues vigorously. Driving north and south in ore of high grade goes along steadily on the 4600-ft. level and workings on levels above. The 60-stamp mill is in continuous operation. N. S. Kelsey is general manager.

The California Slimes Concentrating Co., of which W. E. Darrow is president and other Sutter Creek men heavy stockholders, has obtained a new lease for five years on the Argonaut tailing. Many improvements, including the installation of flotation, are contemplated. A patented process, perfected by Mr. Darrow, is said to make a high recovery. The plant is so situated as to handle all the material that leaves the new 60-stamp mill. The tailing in the pond below the site of the old mill is also being milled at the present time but this is entirely separate from the Darrow plant and another company is handling this branch of the work.

Placerville.—A 4-ft. vein sampling \$50 in gold has been exposed in the Marshall group, three miles north of Placerville. The property was located by James W. Marshall, discoverer of gold in California, and was worked by him for several years.—Good ore is reported in the Manzanita, operated under bond and lease by C. M. Jackson and E. M. Fessler of Stockton.—Bror Soderhjelm of the Ohio deep gravel mine states the gravel mill is to be placed in immediate operation. Gravel panning \$2 to \$10 has been found on bedrock, the rich streak occurring in a wide deposit of fair-grade material.

Redding.—Atascadero Copper Co. has decided to erect a reduction plant at its Greenhorn mine, near Tower House. The type of plant and process will be determined by experiments being made in Oakland. Large reserves of ore are exposed and arrangements made for mining during the winter. Alfred Hanford is superintendent.—The Reid gold mine, Old Diggings district, Whitehouse post-office, is shipping 150 to 200 tons of ore daily to the Mammoth smelter, although the plant is idle. The ore is silicious and 15,000 tons is stored in the smelter yards. Sinking the shaft was recently resumed and a new level opened. Harvey Sallee is manager.

Sutter Creek.—Driving north and south on the 3700-ft. level of the Central Eureka is yielding ore of excellent grade, and in addition an entirely new orebody, rich in specimen ore, has been uncovered on the 3500-ft. level. This probably means the profitable extension of work into a portion of the mine heretofore supposed of no importance. Stopes are now being worked on both the 3500 and 3700-ft. levels and sufficient ore is being mined to warrant dropping additional stamps. During the time required to sink the shaft for the new level and cross-cut to the vein, from 20 to 25 stamps of the 40-stamp mill have been dropping. The grade of ore mined during September has been so good, however, that the largest clean-up since the mine's re-opening in 1908 is anticipated. During the war period the Central Eureka had a hard struggle but at present the prospects are much brighter. Albion S. Howe is in charge.

Taylorsville.—Sunnybrook Copper Co. plans the installation of a compressor and erection of buildings. The property lies near the Engels group and has been undergoing development several years. Clyde Wardlow of Taylorsville is manager.

COLORADO

Chaffee County.—The Mary Murphy mine above St. Elmo is running its mill on the tailing and ore mined by lessees from the old upper oxidized zone. The cross-cut tunnel on the 1500-ft. level has been connected by raise with the 800-ft. level. No stoping has yet been done between. It is stated that on the lowest level 6 to 14 ft. of milling-grade ore is exposed. The ore carries principally silver, with some gold, lead, and zinc. The mine has produced \$9,000,000. It is owned by an English company, and during the War development could not be pushed as rapidly as desired, particularly on the lower levels. Coal is used for power, but as there is a stream above the mill a hydro-electric plant may supersede this some time in the future. George E. Collins is general manager.—The Colorado-Independence, about a mile above the Mary Murphy, is doing development work and occasionally shipping a car of ore. Mr. Felton is manager.—The Flora Belle, adjoining the latter, S. L. Tabor, manager, is also developing. The mill is three or four miles below the mine at St. Elmo, adjoining the railroad. B. A. Hughes, metallurgist, has been changing their flow-sheet and has placed the Hughes patent riffle system upon the Wilfley and Card tables. He has shown that a clean separation can be made by water concentration. Most of the silver and gold goes with the lead instead of the zinc. The mill will probably shut-down until spring, in order to develop sufficient ore to be able to run continuously.

NEVADA

Austin.—Allan Rives and Nick Ableman of Tonopah have taken over the Big Thing group at Telluride and started developments. The group is 400 ft. from the Cahill group, where high-grade ore was recently uncovered.——Jack McLaughlin reports finding a large vein carrying seams of rich gold ore a mile south of the Cahill property.——Austin people are operating the Cahill and driving a tunnel to reach the vein at a depth of 125 ft. The vein is said to be 100 ft. wide near surface, with several streaks of rich ore showing. A camp has been established and a 1200-ft. wagon road constructed to the claims from the county road. The ore carries tellurium.

Como.—Twelve inches of a new vein intersected 115 ft. from the Miller shaft of the Como Consolidated assays \$800 to \$1000 in gold, according to reports from the property. The discovery was made on the Lucky Sunday claim where the Lucky Sunday lode forms a junction with a new vein coming in from the hanging-wall side. The lode has been opened for a width of seven feet with no indication of the hanging wall.

Goldfield.—The Goldfield Development Co. has completed cross-cutting from the 380-ft. level of the Combination shaft into Florence-Goldfield ground, and started driving. Raises will be extended to develop promising ground near the old Riley lease workings.——The cross-cut from the 440-ft. level of the Crackerjack is out 30 ft. and should reach the Crackerjack vein before the end of September.

Hayden.—Ore is being sacked for shipment at the La Toska mine in Wright's canyon, eight miles south of Oreana and the same distance from Loring. The mine has been under development for some years, with an adit 3000 ft. long and drifts and winzes on two main veins. The first at 600 ft. in is 15 ft. wide and averages \$8 per ton in gold and silver. The second at 1000 ft. in is 4 ft. wide, with a portion 18 in. wide that averages 25 oz. in silver and \$10 gold per ton. Ore from this is sorted to a \$45 grade for shipment. Owing to extreme steepness of the mountain and dip of vein, there is 1380 ft. of backs where this second vein is being worked. Chas. F. Champion, of Chicago, is president of the Humboldt Consolidated Mining Co., owning the La Toska, and John B. Newman is manager.

Loring.—The Jose-Davis company has developed an ample supply of water at its mill-site, three miles from the Sheepherder mine at Loring. A pump has been installed, much of the grading done and some of the machinery has already been hauled from the station and is now on the ground. The water in the well is quite warm, while the surface ground is normal, though several miles away the ground is so hot that snow in winter melts as rapidly as it falls. The Jose-Davis company continues to open up ore in the Sheepherder to feed the mill.——The broken parts of the compressor of the Nevada Honey Bee have arrived and work has been resumed in sinking the Malley shaft and driving Benedetti tunnel. Wm. J. Loring is general manager of the Honey Bee and J. H. Bell is superintendent.——Thos. Owens is running an adit on the vein on the Bangor where he recently made a discovery showing much free gold. He was the original locator of the Coalition at Seven Troughs, which was a heavy producer of sensationally rich ore.

Tonopah.—Gibraltar Silver Mines Co., of New York, has acquired the Gibraltar group, six miles west of Round Mountain. It is said a working fund of \$200,000 has been provided and a mill is planned. W. N. Waddell, a New York broker, is president, and R. K. Sherwood secretary. C. Fredericks has been placed in charge of operations and plans to drive two tunnels. The outcrop is 250 ft. high with ore assaying well in silver and gold exposed.——The Arrowhead group has passed under control of Arrowhead Mines Co. Judge R. L. Johns is president, and C. J. Blumenthal, secretary.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

Stuart L. Rawlings has returned to Cerro de Pasco.
F. C. Webb motored from Denver to San Francisco.
Walter W. Lytzen is at Huron, near Prescott, Arizona.
S. K. Dahl, of Herculaneum, Missouri, has gone to Venice, California.

A. C. Nicholson, engineer for the Cleveland-Cliffs, is in New York.

R. S. Baverstock has returned to Los Angeles from Prescott, Arizona.

D. C. Wysor, consulting geologist for the Nichols Copper Co., is at Spokane.

T. J. Jones passed through San Francisco on his return from Siberia to London.

Douglas Waterman returned to Havana on October 2, going by way of New Orleans.

J. H. Collier passed through San Francisco this week on his way from Arizona to Colorado.

J. W. Mercer sailed from Boulogne for New York on September 13, on his return from France.

George H. Sexton, of New York, and George W. Heintz, of Salt Lake City, are at the Palace hotel.

G. Howard Birch, general manager for the Dan Creek Mining Co., at Dan Creek, Alaska, is in New York.

E. W. Engleman has moved from the Ray Consolidated to the Utah Copper Co.'s Arthur plant, at Garfield, Utah.

Frank Cameron sails on October 8 for Rancagua, in Chile, after a short holiday, spent chiefly at Salt Lake City.

V. K. Ting, director of the Geological Survey of China, sailed for China from San Francisco on September 26.

George O. Argall, of Philip Argall & Sons, is returning to Leadville after a couple of months holiday in California.

F. W. Collins, representing Bradley, Bruff & Labarthe, is on his way to Cerro de Pasco, Peru, by way of New York.

Alan M. Bateman, Professor of Economic Geology in Yale University, has returned from a professional trip to Alaska.

Roy S. Handy, mill superintendent for the Bunker Hill & Sullivan company, at Kellogg, is on a short visit to Yampa, Idaho.

Adolph Gernet sailed on the 'Persia Maru' with Alexander Malozemoff, manager of the Lena Goldfields, on the return to Siberia.

James L. Bruce has resigned as manager for the Butte & Superior Mining Co., to become general manager for the Davis-Daly company.

H. C. Hoover is at Palo Alto. The engineers of San Francisco have arranged a dinner in his honor on October 7 at the Commercial Club.

H. R. Bostwick and A. R. Weigall, accompanied by Capt. F. B. Lawson, of London, sailed on the 'Nanking' for Yokohama on October 2, on their way to Korea.

W. S. McCann, lately Captain in the Canadian Field Artillery, and now on the Canadian Geological Survey, was in San Francisco on his return from Grass Valley to Ottawa.

Obituary

Herbert G. Thomson, a graduate of the University of California, and general superintendent for the Nevada Packard Mines Co., at Lower Rochester, Nevada, died on September 25 from injuries received in a fall into a shaft while sampling ore. He is survived by a widow, a young

child, a mother, Mrs. Annie Thomson, of Oakland, and an uncle, John Fennis. Mr. Thomson was a highly valued correspondent of the 'Mining and Scientific Press'.

Frank Cochrane, Minister of Lands, Forests, and Mines in the Ontario Legislature, died on September 22 at Ottawa. On the return of the Borden Government to power in 1911, he accepted the Railway portfolio in the Federal Cabinet; but owing to ill health he resigned some time ago. As a young man Mr. Cochrane was prominently identified with the development of Northern Ontario, where, in a pioneer country, he acquired at first hand much of the knowledge that was later so valuable to him in his political career.

HENRY C. CALLAHAN

One of the best known mining engineers of California, Henry Clay Callahan, has passed on. Born at Callahan, in Siskiyou county, in this State, on October 6, 1852, he came of sturdy pioneer stock, his father, an associate of David D. Colton and "the Wells-Fargo crowd", coming to California by the Panama route in 1849, and his mother arriving by the same route in 1850, just in time to be present at the historic ball at San Francisco, in celebration of the State's admission into the Union in the previous September. Young Callahan first became interested in mining in the early 'seventies, through the hardware business, at White Pine, Nevada. In 1873 he went to Virginia City, and, upon the advice of E. J. Baldwin, began to learn mining at the bottom of the ladder, in the Ophir mine; and it was here that he was learning the dips, spurs, and angles of the mining game when Sam Curtis drove the historic 1300-ft. level of the Gould & Curry through the Best & Belcher ground, and gave the bonanza firm the advance information that enabled them to gain control of the Con. Virginia while the owners of the latter were sinking its shaft. Through the experience he gained on the Comstock he was appointed superintendent of the South Star and Titus mines, situated on Emma hill, in Utah, whose long-drawn out litigation with the Flagstaff gave him his experience in the ruinous costs of such affairs and implanted in him a distrust of the effectiveness of our American mining laws and customs, which was only strengthened by his experiences in the Australian goldfields in later life. After operating at Bingham and Tuscarora, he settled at Bodie, California, in 1877, but soon thereafter, during the Leadville excitement, accepted the management of the Bull Domingo mine, in Custer county, Colorado. From here he went on the mining staff of George Hearst in New Mexico and Arizona during the years 1881 and 1883, and thereafter returned to California, taking charge of the Bonanza King silver mine, in San Bernardino county. Later, after examining and reporting upon various properties for the Exploration Company, of London, including the La Union mine, in Costa Rica, he joined Bratnaber & Wartenweiler in 1893, and, with Henry Bratnaber, left for Australia in 1894. Here, in what proved to be the land of opportunity for Loring, Fred Thomas, Hoover, and so many other Californians, he made reputation and fortune. After some exploration work in New South Wales, he came to Coolgardie, in Western Australia, for the first time. At that period, the afterward famous Golden Mile of Kalgoorlie, the adjacent district, was unknown except as an almost deserted placer camp known as Hannan's. Here were subsequently found the Great Boulder, the Ivanhoe, Lake View, Perseverance, and Associated mines. After two trips to London and two to New South Wales, he accepted the appointment of general manager of the Lake View mine. Callahan was a born geologist. He developed this marvelous mine, with its lode dangerously near its boundaries, and co-ordinated its every part. The remoteness of the country challenged but did not freeze his resourcefulness. With the genius of the engineer educated in the university of the mining camps he solved the vexa-

tious problems of transportation, water supply, cyanidation, accurate sampling and assaying of reserves, and was soon able to notify London of the real value of the Kalgoorlie lodes, and to forecast their wonderful future. The zest of the fight of the geologist and the mining engineer was supplemented by the romance of the plot and counter-plot of the London market that in many ways paralleled the excitement of the boom days on the Comstock. Though liberal and even generous in making business deals, he did not hesitate to fight to a finish where he felt his rights were unduly invaded. During his management of the Lake View and Ivanhoe he undertook the cyanide litigation. The demand to pay a royalty for the use of the McArthur-Forrest cyanide process he considered excessive, and he doubted the claim of right to collect the same in Western Australia. The managers of the other mines in the district were of the same opinion and agreed to share the expense of the litigation if the Lake View Consols would undertake to fight the

case, but their London directors refused to live up to the agreement. Some of the Lake View directors were inclined to pay \$80,000 for the right of the cyanide patentees in Australia. Callahan had collected the evidence and the attorneys decided not to compromise. The Courts decided in favor of his company, and the decision was confirmed in the House of Lords. The cost of the litigation was 13,000 pounds sterling. Mr. Callahan became the leader of Kalgoorlie in its civic and industrial life. He was the head of the splendid commission appointed by the British government to represent Western Australia at the Paris exposition of 1900, and the only American upon it, and some years thereafter retired from active work, returning to California. He never married. He was a fine type of the virile, clear-brained, resourceful, far-seeing man of capacity, a courageous and trustworthy administrator, a good brother, a loyal friend. His profession is familiar with the type—the strong upstanding son of the brave Pioneer.—J. F. D.

Book Reviews

A System of Physical Chemistry. Second edition. By William C. McC. Lewis. Edited by Sir William Ramsay. In three volumes. Longmans, Green & Co., London. For sale by 'Mining and Scientific Press'. Vol. I, 'Kinetic Theory'. Pp. 494 + xii. Price, \$4.50. Vol. II, 'Thermodynamics'. Pp. 403 + vi. Price, \$4.50. Vol. III, 'Quantum Theory'. Pp. 209 + viii. Price, \$2.50. Each volume complete, with table of contents and indexes.

The author of these volumes, as will be remembered by those familiar with the first edition, is Brunner professor of physical chemistry in the University of Liverpool, and well qualified to deal with this difficult subject. This edition has followed the general plan and arrangement of the first, but includes so many changes, necessitated by the advances made in physical chemistry during the last few years, that there has been considerable expansion in size. Volume III on the 'Quantum Theory' was in the first edition merely a chapter, but the rôle now played by the quantum theory in physical and chemical research renders this more detailed treatment necessary for the advanced student. These volumes are intended for use as a general textbook by those who already have some knowledge of physics and chemistry, and have therefore treated their subjects comprehensively and with thoroughness. Statements ascribed to other investigators are, whenever possible, quoted verbatim in order to avoid possibility of error or misunderstanding. The arrangement has been planned, in accord with what has been found best in Dr. Lewis' wide teaching experience, so that the most difficult part of the subject is deferred until the student has grasped some of the simpler principles. The volumes are adequately illustrated, and are recommended as a clear and orderly presentation of this intricate but interesting study.

Office Management. By Lee Galloway. Pp. 670, ill., index. The Ronald Press Co., New York. For sale by 'Mining and Scientific Press'. Price, \$6.

The domain of the 'office' was for some time considered a sanctuary from the efficiency expert, but such is no longer the case. The office-manager must meet the cold clear eye of Missourians just as the manager of any other department. The present volume is one of the most complete that has appeared on the general subject indicated by the title. It discusses every branch of the office, including the clerical, stenographic, filing, purchasing, sales, advertising, and accounting departments. Selection of an office-building, office equipment, methods of organization, training of workers, wage and bonus systems, as well as many other minor subjects are also discussed. While much of the discussion is better adapted to the needs of the office employing several hundred clerks than to the small establishment, the office-manager or the owner of a small business will find a great deal that will be of interest and value to him.

The Metals of the Rare Earths. By J. F. Spencer. Pp. 279 + x. Longmans, Green & Co., London. For sale by 'Mining and Scientific Press'. Price, \$4.50.

'Rare earths' is the term applied to the oxides of a number of metals that are characterized by a remarkable similarity of the physical and chemical properties of their compounds. They occur in complex mixtures, which can be separated into their components only by laborious and difficult processes, and are generally divided into two groups, the cerium earths and the yttrium earths. In different combinations they are used for a variety of purposes, of which perhaps the most prominent are welsbach mantles, sparking alloys for automatic lighting, for staining glass, and as a

catalyst in the manufacture of sulphuric acid. The cerium compounds also have certain medicinal uses. The book goes thoroughly into all these phases of the subject. It starts with a history of the discovery of the rare earths, and then takes up their occurrence and the methods of separating them from each other. The two groups are treated fully. Methods of determining atomic weights—a difficult problem on account of the similarity of their chemical properties—is treated in great detail. The book closes with a description of their uses, and an exceptionally complete bibliography and set of indexes. It is a painstaking and orderly presentation of the facts that are now known concerning the rare earths, and is practically necessary to any chemist or student desirous of informing himself on the subject. We wish we could say as much for the binding, which is very badly done and not at all worthy of the contents. This, however, is a detail.

Handbook of Mechanical and Electrical Cost Data. By Halbert P. Gillette and Richard T. Dana. Pp. 1716, ill., index. McGraw-Hill Book Co., New York, 1919. For sale by 'Mining and Scientific Press'. Price, \$6.

As the preface states, this book is intended as a companion volume to Gillette's 'Handbook of Cost Data', and also Dana's 'Handbook of Construction Plant'. The arrangement is similar to the former book, but there is little overlapping. In these days of abnormal prices, and of discussion as to whether or not large reductions will be made in the near future, some engineers and estimators may feel that a book of cost data, since its costs manifestly cannot be brought up to the minute, is of slight value. That this viewpoint is erroneous, provided the cost analysis is accurate and complete, is shown by the authors in the first chapter.

EASTERN METAL MARKET

(By wire from New York)

Sept. 30.—Copper is dull and easy. Lead is inactive and weak. Zinc is listless and lower.

SILVER

Below are given official or ticker quotations, in cents per ounce of silver \$99 fine. From April 23, 1918, the United States government paid \$1 per ounce for all silver purchased by it, fixing a maximum of \$1.01½ on August 15, 1918, and will continue to pay \$1 until the quantity specified under the Act is purchased, probably extending over several years. On May 5, 1919, all restrictions on the metal were removed, resulting in fluctuations. During the restricted period, the British government fixed the maximum price five times, the last being on March 25, 1919, on account of the low rate of sterling exchange, but removed all restrictions on May 10. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the normal rate of exchange.

FOREIGN EXCHANGE

Foreign exchange has continued to improve during the week, several times showing such pronounced strength as to cause considerable comment. It would seem for the moment that the pressure on the exchanges had greatly lessened, while buying—including some though of speculative nature—has turned strong. Maturing obligations which weighed on the markets a fortnight ago seem to have been well cleaned up or taken care of. Trading in mark options has received a tremendous stimulus from the recent advance. Demand emanates chiefly from stock-brokerage houses, and is being supplied by the Foreign Trade Banking Corporation, whose staff is kept busy until late in the evening. The calls are sold for account of European banks. It is understood Swiss banks in particular are marketing the options here as a hedge against loans outstanding in Germany.

A prominent exchange dealer says: "The German government has to all intents reduced the par of the mark to a quarter of its former value. A law has been enacted compelling payment of import duties in gold. But as gold is not available, the Government is permitting payment in paper marks, which it values at one-quarter of a gold mark. It has virtually reduced the par from 23.8c. to 5.95c. On this new par, mark exchange shows a depreciation of only 35%. This reduced par will be advanced from time to time as Germany's financial position improves. But it is doubtful if anything will be done in that direction for a year or two, owing to currency inflation, aggravated by a huge loss of gold through payments for purchases of foodstuffs, and the enormous war indemnity."

Gold: According to the latest advices from London, the Bank of England still exercises some measure of control over the disposition of the South African gold miners may make of their output. Agreement they have made with the bank provides that they shall consign their production to the bank, but that they shall be free for five weeks after its receipt to dispose of it in the open market. No doubt the object of compelling shipment to London is to maintain the position of that centre as the world's principal distributing point. Without such control over their movements, consignments from South Africa would unquestionably be routed directly to New York and other centres which are more attractive markets for the metal than London. If the gold is not disposed of within five weeks after its arrival in London, the Bank of England reserves the right to purchase it. It is not stated, however, whether the bank in that event will pay more than 77s.9d. an ounce, the price it allowed the miners before it entered with them into the present agreement. However, in the present position of sterling exchange, it is most unlikely that the central institution will succeed in retaining much of the new production.

If there were no restrictions on importation of gold into India, that country would be the most favorable market. Not only is rupee exchange quoted at a premium in London, its rate being fixed at 22d. per rupee, as against the par of 16d., but gold is ruling at a premium of about 30% in the Indian bazaars. However, importation of gold into India for private account is prohibited, unless shipment is turned over to the Government mint, which allows a considerably lower price than is quoted in the open market.

Heretofore announcement has been made only on the Transvaal's miners entering into the arrangement with the Bank of England regarding the marketing of their output, but it is understood that Rhodesian, West African, and Indian producers have made a similar agreement with the bank.

Quotations on September 30 are as follows:

| | |
|-----------------------|-------|
| Sterling: Cable | 4.10½ |
| " Demand | 4.18½ |
| Francs: Cable | 8.18 |
| " Demand | 8.20 |
| Lire: Demand | 9.64 |
| Marks | 4.80 |

Eastern Metal Market

New York, September 24.

The quiet which prevailed in the metal markets has been accentuated by the steel strike.

Copper is dull and easy, outside quotations being lower, with the large consumers holding to their pegged price.

Tin prices show a declining tendency. The arrivals are fairly large and consumption is lessened by the shutting down of tin-plate mills.

With the demand light outsiders are making the market, but quotations are being held up.

The shutting down of galvanized plate mills in the Pittsburgh district is having an adverse effect on the zinc situation.

Antimony presents no features of interest.

IRON AND STEEL

The expected struggle between the steel companies and their organized employees started according to schedule September 22. For a day or two there was so much confusion and so many claims and counter claims that the situation could not be measured, and the magnitude of the opposing powers cannot be weighed yet. It is certain, however, that the mills in the immediate vicinity of Pittsburgh, especially the large ones operated by the United States Steel Corporation, have not been affected to any serious degree. In Chicago, Youngstown, Johnstown, Cleveland, and Buffalo it is different, for many great mills, as the press reports indicate, have been forced to shut-down, these including the Cambria works at Johnstown and the Inland Steel Co. of Chicago, both of which had worked out and applied carefully devised plans for employee representation in case of dissatisfaction. The main question at issue is recognition of the unions. Some big steel men, anxious to know just who is to control their businesses, are not entirely averse to having a test of strength at this time. They maintain the open shop is the right principle and they will fight for it. Of course the strike brought paralysis to every branch of the iron and steel industry so far as selling was concerned, most of the companies declining to take orders, and making no promises as to deliveries against the orders on their books. The lessened production of galvanized sheets, tin-plate, and many other products using non-ferrous metals will unquestionably seriously affect the metals if the strike is long drawn out. This remains to be seen. At the outset it appeared that the mills had the best of the situation. At this writing both sides are pointing to the alleged exaggerations of the other.

COPPER

Quiet as the market was, it has been made more so by the strike of steel-mill workers. The market, in regard to prices, has continued to pursue an irregular course, the large producers holding electrolytic nominal, at or near 23.50c., while dealers and smaller producers are willing to sell at 21.75c., and possibly lower. Only actual negotiations would determine just what figure would be accepted. It is maintained, however, and probably with truth, that should a large tonnage be wanted it could not be obtained at the low figure referred to. Meanwhile, in a dull and weak market, consumers are not much inclined to buy, the very readiness of sellers to urge sales tending to make the consumer more cautious. Government offerings of brass are also having a deterrent effect. For the last quarter electrolytic quotations range from 21.75 to 22c., with Lake at 22.25c. Only guesses can be made as to the ultimate effect of the steel strike, but one thing is certain: the non-ferrous metals to a large extent go with iron and steel.

TIN

As in copper, the tin market is most seriously affected by the steel strike. Spot Straits metal was quoted September 23 at 55c., September Straits shipment at 53.50 to 53.75c., and last quarter shipment at 53.25c. Very little has been done in the week and the prospect is for even greater quiet. Meanwhile arrivals from London and the Far East have been fairly large, 2160 tons arriving at Atlantic ports in the first 18 days of the month, and 825 tons at Pacific ports. The total quantity now afloat is 6300 tons, so it is evident that, under prevailing conditions, there is plenty, if not a surplus, to meet demand. Virtually all the leading tin-plate mills have been closed, for how long only time will tell. Spot Banca can be had at 54.50c., and 99% Lamb & Flagg at 54c. for spot. The London market yesterday quoted spot Straits £279 10s.

LEAD

The market is being made by outsiders who quote 6.20c., New York, against 6.25c., quoted by the leading producer. Most of the makers are understood to have but little metal to offer. Not much has been done by any of the sellers. Some producers who stopped operations a few weeks ago are preparing to resume production, but as yet they are not quoting. Meanwhile demand is light and no great increase can be looked for until labor difficulties are somewhat cleared up.

ZINC

The market is quiet and a little easier, the quotation for prompt Western shipment today being 7.45c., New York, and 7.10c., St. Louis. The demand for galvanized sheets has been poor, resulting in the shutting down of several galvanized plate mills in the Pittsburgh district, on top of which comes the steel strike which will further lessen the production of plates and the consumption of spelter. The Geological Survey has issued its statistical report for the first half of 1919, and the fact that production in that period did not fall off more than it did has occasioned surprise. In the first half of 1919, 255,502 tons was produced, in the second half of 1918, 260,664 tons, and in the first half of 1918, 257,263 tons.

ANTIMONY

In a quiet market, 8.50c. can be done for prompt antimony, and this price might be shaded for carload lots. Jobbing lots run $\frac{1}{4}$ c. to $\frac{1}{2}$ c. higher than the carload price.

ALUMINUM

No. 1 virgin metal, 98 to 99% pure, is unchanged at 32 to 33c. for early delivery.

ORES

Tungsten: There is no business to report, the trade being at a standstill. It is considered probable that the question of a duty on tungsten will come before the financing committee of the Senate within a week or ten days. Quotations are nominal at \$7.25 to \$7.50 for Chinese ore, \$12 for Bolivian and \$15 for Western scheelite.

Molybdenum: No change can be reported. There is but little inquiry. Hopes that the American surplus might be placed in Europe have faded with the information that the Europeans are ready to sell here. The nominal quotation is 70 to 75c. per lb. of MoS₃ in regular concentrates.

Manganese-Iron Alloys: Domestic makers quote \$110, delivered. The price situation is not one that invites consumers to buy, while the effect of the steel strike on consumption must be considered. Spiegeleisen is quiet at \$35 furnace, for 18 to 22% material.

INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

NEW TON-AND-A-QUARTER GARFORD MOTOR TRUCK

The Garford Motor Truck Co. of Lima, Ohio, announces the addition of a ton-and-a-quarter truck to its already extensive line. It is to be known officially as Model 25. This latest Garford development is described as having ample wheel base and body space and is said to be the "huskiest" model of its capacity produced to date. Provision has been made for the installation of electric lights and an electric starter. The engine, of 22 hp., S. A. E. rating, has four cylinders $3\frac{1}{2}$ by $5\frac{1}{2}$ in. cast in one block, with heads and valve chambers integral. The valves are large and ample water jacketing is provided. With the valve location on the right side and the carburetor on the left, the gas passes through a water-jacketed section of the cylinder. The engine is of sturdy design, employing a heavy crank shaft of the three bearing type, and cast iron upper and lower crank cases. The fly wheel is enclosed in a housing integral with the crank case. The pistons of gray iron are provided with three concentric tested compression rings. The pistons and connecting rods are of unusual length and the piston sweep is practically confined to the cylinder bore. Only a very small portion protrudes below the cylinder base when at dead centre.

The timing train is limited to three gears. This accounts in part for the quietness of operation that is characteristic of this model. The magnetic drive gear-shaft is extended forward of the gear-panel to drive the centrifugal water pump. When electrical equipment is required the magneto is driven in tandem with the generator, thereby eliminating the necessity of chains for this unit. The timing gears, which operate in oil, are helical in form and of very broad face. The crank shaft and four long rod bearings are of the bronze-shell, babbitt-lined type. The upper rod bearings are hard bronze. The oiling is of the constant level splash system. A gear pump driven by the cam-shaft circulates oil through a steel tube system to the main shaft-bearings, the overflow oiling the piston and cylinder. Lower rod bearings are oiled by splashers dipping into troughs filled by a feed from the gear-pump. Ignition both on the standard and the electrically equipped models is by straight high-tension magneto. The magneto is controlled from the steering-column. The spark-plugs are over the inlet valves. Carburetion is obtained through a Stromberg one-inch float-feed carburetor. The throttle control is by foot acceleration as well as by hand throttle from the steering column. The clutch is of the multiple dry-disc, ball-bearing type enclosed in a housing attached to the fly-wheel case. The transmission is a three-speed selective type with all gears and shafts constructed of $3\frac{1}{2}\%$ nickel steel, double heat-treated. The shafts are mounted on roller bearings throughout. The gear and shaft rods are on top of the transmission case. As in all other Garford models the case is supported at three points.

The design of the Model 25 is characterized by its heavy shafts and large bearings. It provides for direct attachment of a power tire-pump. The front drive shaft employs a pair of composition discs. The drive is tubular, requiring no

lubrication and eliminating the possibilities of grinding and rattle. The rear drive is of Spicer make, all steel, grease tight and dust proof. The front axle, of Garford design, is manufactured entirely in the Garford plant. It embodies a single piece drop-forging for the load-carrying member, and nickel-steel knuckles. Oversize knuckle pins and a spherical seated ball-thrust mark this axle as unusual for a one and one-quarter ton model. The Model 25, virtually a ton-and-a-quarter truck, embodies characteristics of strength obtainable in a truck of one and one-half ton capacity. It has a one and one-half ton rear axle and a one and one-half ton frame, with a transmission of the same type. The housing of the rear axle (a worm drive type) is of one piece, thereby eliminating the liability of leaky joints and stretched bolts. The axle shafts are $2\frac{1}{2}$ in. diameter at the bearing and have a splined fit in the differential. Timken bearings are used both at the wheels and differential. The differential is of the bevel type. Combined with the worm-carrier it may be removed from the axle as a unit. The worm is of hardened steel, the matting gear of bronze.

There are two independent sets of brakes operating on the rear wheels. Brake control is conventional in that one set of brakes is operated by pedal, the other by hand lever. Both braking systems have equalizers. Brake-shoes, levers, drums, and operating parts are unusually heavy, corresponding in size to most two-ton equipment. The radiator is of the heavy truck pattern. Upper and lower water tanks of cast iron are bolted to the vertical, finned tube, copper core. The radiator is mounted on a cushion suspension. Steering is by screw and nut—an irreversible combination. The hand wheel is 20 in. diameter and has a notched rim. It is of the five-arm malleable spider type. The entire gear is extremely rugged for a one and one-quarter ton truck. Gasoline is fed by gravity to the carburetor. The welded steel tank, located under the seat, has a capacity of 20 gal. A combined strainer and shut-off, attached directly to the tank, is employed in feeding the gas. Front and rear springs are of the semi-elliptic pattern with leaves of chrome vanadium steel. The former are 42 by $2\frac{1}{2}$ in. with eight leaves, the latter 50 by $2\frac{1}{2}$ in. with eight leaves. The spring shackles are of drop-forged, heat-treated steel. Lubrication of the shackle pins is by oil feed. The frame of 7/32 in. stock has a depth of 5 in. and a width of $2\frac{1}{2}$ in. It is of pressed steel construction and has six pressed-steel, channel-section cross members. All connections as well as brackets are hot riveted. Front and rear wheels are of wood with the S. A. E. standard felloe bands.

The standard tire equipment is of the solid pressed on type. The front tires are 36 by $3\frac{1}{2}$ in.; the rear 36 by 4 in. Pneumatic tires, which are particularly adapted to this new model, come as extra equipment. The curved steel dash and seat-box are included as standard equipment with the chassis. These units are of high quality wood with a covering of heavy gauge body steel. The control is standard with the steering wheel at the left and the brake and the clutch at the centre of the chassis. The spark is controlled from the steering column. The lamp equipment includes two side oil-lamps mounted flush in the dash—a special feature

—and one rear signal oil-lamp. The seat is extra wide and carries three persons comfortably.

A special effort has been made to standardize the Model 25 throughout, with the result that odd wrenches and spanners are not required. A full set of tools is included in the price of the chassis which is quoted at \$1890 f.o.b. Lima, Ohio. Pneumatic cord tires 36 by 6 in. all around, a power tire pump and extra rim, are furnished at \$285 extra. Electric lighting and starting may be had for \$125 extra.

COMMERCIAL PARAGRAPHS

The American Continuous Retort Co., Denver, has issued a booklet descriptive of its system of retorting. This is a method of oxidizing ore at a low heat.

A 4-page 8½ by 11 in. folder has been issued by the Page-Hersey Iron, Tube & Head Co., Toronto, Ontario. This folder illustrates principally pipe bends and flanged joints.

The Chicago Pneumatic Tool Co. announces the appointment of Fred Gehbauer as special navy yard representative, with headquarters at its Philadelphia office, 1740 Market street.

The Drake Lock-Nut Co., San Francisco, has begun to develop an export trade. Recently several orders have been booked to Australia, New Zealand, Java, Siam, China, and other Oriental countries, and South Africa. Exclusive agencies have been given to large concerns in South Africa, New Zealand, and Australia.

Pamphlet No. 9-C illustrating impact screens has been issued by the Colorado Iron Works Co., of Denver. This is a 24-page booklet that illustrates and describes various sizes of impact screens under different operating conditions. In addition, detailed drawings are given, showing the timber-work for setting the screens, and drawings by which the parts may be identified.

The Wellman-Seaver-Morgan Co. have issued Bulletin No. 22, which is a folder giving charts that show the relations in any shaft between power, shaft-diameter, torsional stress, and speed. The charts are so arranged that when any three of these are known the fourth can be found immediately. Wellman-Seaver-Morgan announce that they will be glad to send copies without charge to anybody who will write to them.

S. F. Bowser & Co., Fort Wayne, Indiana, has recently issued three folders describing the Bowser oil-storage system and accessories. The smallest one is so arranged that any combination of tanks from one to a battery of four can be shown, and all three illustrate and describe various types of their oil-storage and handling apparatus. They are attractively illustrated and should be useful to anybody interested in oil.

Transportation in mining districts is a complicated problem; therefore a catalogue on gasoline locomotives such as that just issued by the McFarlane-Eggers Machinery Co., 2757-2763 Blake St., Denver, is always interesting. The first cost of these locomotives is small, and the operating costs compare favorably with steam and electricity. This catalogue illustrates and describes the sizes of locomotives peculiarly adapted to mining use, that is, those having gauges of from 18 to 36 inches.

Suit has been commenced by John D. Hoff by his attorneys Clarke and Clarke for infringement of his patent for calcining magnesite ore. The defendants are the Magnesite Production Corp. and Moore, Morrison et al, the owners of the extensive Sampson magnesite properties in San Benito county, California. The patent consists of a new and improved method of calcining magnesite ore in vertical kilns. The by-path process ensures a continuous operation of the kiln, and a more perfect calcination of the ore for plastic purposes. Mr. Hoff and his associates have also commenced action for recovery of the property that they have under

lease and on which they have expended within the past two years more than one hundred thousand dollars. Operations have been suspended for some months because of the tariff situation and the scarcity of market demands.

Collins & Webb, Inc., Los Angeles, have opened a San Francisco office at 229 Rialto Bldg. This has been placed in charge of George Fisher, who was for many years general superintendent for the Riverside Portland Cement Co. They have also opened a new store in Los Angeles at 447-449 East 3rd St. This store gives them ample room to take care of their increasing business. It has a floor space 35 ft. by 100 ft., with three stories and a basement. It is equipped with a 2-ton electric elevator and has a private spur-track in the rear.

'Centrifugal Pumps for Irrigation and General Utility' is the title of Bulletin No. 11 issued by the Pelton Water Wheel Co. This bulletin shows a section of a typical pump-house, and contains many suggestions for the proper installation of centrifugal pumps. A rating table on capacities, speeds, and horse-power is included, as well as a table giving data for use in flooding land. There is, in addition, an estimate data sheet for proposed users to fill out and send to the Pelton company in order to receive full information concerning their particular problems.

The National Tube Co. has issued Bulletin No. 7, which describes the manufacture and advantages of 'National' welding-scale free pipe. This booklet, attractively printed on good paper, gives, among other things, a detailed description of the process by which a wrought butt-weld pipe is made free of welding-scale. It is fully illustrated with cuts that show the process clearly. Curves are given comparing the friction-loss for both standard wrought pipe and welding-scale free pipe, as well as a brief tabulation of the physical properties of this 'National' product.

A new Allis-Chalmers bulletin, No. 1456, on the Fairmount type crusher has just been received. This crusher obtains its effect by means of a roll, with removable teeth, which crushes the rock against a fixed curved anvil. Preliminary breaking of large pieces is accomplished by the sledging action of the teeth as the rock rests on the roll by gravity. When the larger pieces have been thus broken they are caught by the teeth and carried between the roll and the anvil. Crushers are illustrated up to 60 by 84 in., which has a capacity between 500 and 1500 tons per hour.

Troy trailers are illustrated, with specifications, in a 5-page 9 by 11 in. folder issued by the Troy Wagon Works Co., Troy, Ohio. The same company has also published a 57-page pamphlet on 'Profit Sharing and Bonus Systems' as applied to trucks, trailers, taxis, and bus-lines. The object of this booklet is to improve the operating conditions under which trailers are used, and thus improve the service that they give. The booklet consists of a series of articles by different authors describing bonus systems that have been used successfully on different types of transportation. It should be interesting and useful to everybody having transportation problems to solve.

The Stimpson Equipment Co., Salt Lake City, has recently placed on the market the Mitchell electric vibrating screen. This was invented by B. A. Mitchell, chief mechanical engineer to the Utah Copper Co. at Garfield, and embodies a principle entirely new in screening work. By means of an ingenious electric vibrating mechanism, the screen receives rotary impulses that force the meshes up into the material 3600 times per minute. The amount of the motion is so small that to the eye the screen in operation appears merely as a blur, but the effect of this rapid vibration is to stir the material so completely that practically every particle of the undersize passes through the screen. An attractive booklet has been issued by the Stimpson Equipment Co. describing and illustrating this screen.

HOW

The Paraffine Companies Inc. helped develop the oil and asphalt industry of California

The tremendous growth of the oil and asphalt industry of California was due in a measure to The Paraffine Companies, Inc.

How?

"Black Paraffine" Apparently Worthless

In the early days, oil experts from the Pennsylvania fields, thought that the black viscous residue left after the lighter oils had been distilled from California petroleum was "black paraffine." But it was not like the paraffine they knew, and they considered it worthless.

For a long time the oil industry was handicapped by the large quantity of this black residue.

Its Great Value Discovered

Then came Beardsley, an Eastern oil expert, and Pierce, a chemist, who resolved to find a use for it. They experimented ceaselessly without result, until one day by accident they discovered that this "black paraffine" would dissolve readily in that evil-smelling liquid known as carbon bisulphide. Their search was at an end. They had made a paint which dried quickly and withstood the action of acids and alkalis.

As a result of this discovery The Paraffine Paint Company was formed to manufacture the now famous "P & B" paints and a small plant was established in Oakland in 1884.

Oil Was Distilled to Get the Asphalt

During the early life of The Paraffine Paint Company there was difficulty in securing enough "black paraffine," or what was

later discovered to be asphalt. The oil companies had trouble in supplying it, because it forced them to distill a large quantity of the lighter oils in order to get the residue. And they stated there was little or no market for the distilled products! Thus, for a time, asphalt was the main product and the lighter oils the by-products. A curious situation in the light of present-day conditions.

Growth of The Paraffine Paint Company

Through the Company's success in making paint, other uses for asphalt were sought and found, and it gradually extended its business. New products were brought out from time to time, such as "P & B" roofings—the original ready roofing—building papers, specialty paints and wall board, and later, floor coverings.

The Paraffine Companies, Inc., Organized

Built upon a solid foundation and a policy of high quality always, the Company grew and expanded until in November, 1917, The Paraffine Paint Company with other companies was merged into The Paraffine Companies, Incorporated. Today this organization is one of the largest industrial concerns in the West and the products of its fourteen great plants are distributed throughout various parts of the world.

THE PARAFFINE COMPANIES, INC.

San Francisco, Calif.

CIRCULARS have been issued announcing the forthcoming annual convention of the American Mining Congress at the Planters hotel in St. Louis on November 17 and the four following days.

PAYMENT of interest on the loans made by our Government to the Allied countries has been postponed by the Treasury department. This may have been done in order to prevent a further slump in foreign exchange, a condition inimical to international trade, but it may signify the eventual renunciation of interest on these loans to our Allies and even the cancellation of some of them. The loans amount to about ten billion dollars and the interest to about \$500,000,000 per annum. Evidently the liquidation of the cost of the Great War will not be settled for many years to come.

STOCKS of non-ferrous metals in the hands of the British government are declining, it is pleasant to note. On September 1 the stock of copper was 63 million pounds as against 99 millions on July 1. During the same period the stock of lead decreased from 271 to 188 million pounds, and of spelter from 88 to 69 million pounds. During August alone the decrease in copper was 25%, in lead 22%, and in spelter 13%. This does not include any supplies held by private consumers, but it is encouraging to producers in this country. Copper is being shipped from New York on consignment, a custom that prevailed before the War. The metal goes to the European agents of American producers and is held by them for quick delivery as the demand expands.

PERPETUATION of mining-company organizations, to which Mr. Graton refers in his discussion of Federal taxation, is illustrated by the Esperanza, which, we are informed, has arranged to acquire the Union en Cuale property in Jalisco, on the west coast of Mexico, in order to take the place of its exhausted bonanza in the El Oro district. A first payment of \$250,000 is to be made, by instalments, before March 1921, giving eighteen months for exploratory work by diamond-drilling and also development work on the lower levels. A favorable report on this new venture has been made by the Esperanza company's manager, Mr. Charles Hoyle. Large widths of a complex ore rich in zinc, lead, silver, and gold are exposed in bodies of considerable length. It is estimated that a capital expenditure of two to three million dollars will be required to prepare the property for an output of 2000 tons daily. From two of the mines

a production of six million ounces of silver is recorded down to a depth of only 400 feet. The property is on Banderas bay, near the port of Las Penas, and embraces 2000 acres of fertile land. The Esperanza directorate includes Messrs. R. J. Frecheville and F. W. Baker, both men of wide experience in mining affairs, and in Mr. Hoyle they have a thoroughly competent adviser. We trust the new venture will prove as successful as the old.

FREIGHT-RATES on steel from Eastern plants to California are so high—and discriminatory—as to warrant the protest filed recently with the Railroad Administration. The present rates are \$27.50 per ton from the Atlantic seaboard and \$25 from Pittsburgh, although before the War the water-freight by the Panama Canal was only \$15, and delivery was made in 30 days, which is better than is done usually by the railways. These, moreover, have a nasty knack of delaying a part of the shipment, usually the one without which the entire building operation cannot proceed. The Pacific Coast will never be independent industrially until it fabricates its own steel. More than gold or prunes, we need domestic steel, made from our own ores in our own foundries. The ore exists and the fuel, but these two essentials have not been co-ordinated, as yet.

IN this issue we publish the first of a series of four articles on the technical operations conducted by the company controlling the Suan Concession, in Korea. This enterprise, which is associated with the names of Messrs. H. Collbran and H. R. Bostwick, has achieved honorable distinction among American ventures abroad and illustrates the application both of good judgment and skilful management. The authors of the articles, Messrs. A. R. Weigall and J. F. Mitchell-Roberts, are well known in the profession as highly competent technicians, therefore their careful account of the methods and processes used on the Concession will be much appreciated. Mr. Weigall is the manager and Mr. Mitchell-Roberts the assistant-manager, now retiring, for the Suan Concession. We publish a good map of Korea, on which the places of the other concessions are indicated. Of these the chief is the American concession near Unsan, where the Oriental Consolidated, a famous mining property, is situated. This is associated with the name of H. C. Perkins, who went there first in 1899, as recorded in the interview published in our issue of May 19, 1917. Mr. Perkins established the policy of training and employing native labor instead of depending upon imported white

labor. The English concession is identified with the Gwendolin mine formerly operated by the Anglo-Korean syndicate. The Italians have a promising copper mine at Hu Chang; this is operated by a company organized by the late Hansaburo Hunter. The Japanese concession is at Chiksan, where gold-quartz veins were worked before dredging for gold and monazite was undertaken successfully. The German concession was a failure; it was a placer mine, which was visited by Prince Henry of Prussia not long before the War; on which occasion he went through the motions of testing a pan-full of gravel in which several large nuggets had been placed. The reader will note the main line of travel from Japan to Korea, by way of Shimonoseki to Fusan, across the strait of Tsushima, 120 miles wide. It was there that the Russian fleet was destroyed by the Japanese in 1905.

SUIT has been brought by the Minerals Separation company against the Nevada Consolidated Copper Company for infringement of patent. This is the first case against the disseminated copper group of mines. The Minerals Separation people ask for all gains and profits above those that would have resulted if the Nevada Consolidated had adhered to straight water concentration during the past four years. The recent decision of the U. S. District Court of Appeals in San Francisco (as recorded in our issue of September 20) in the matter of the Butte & Superior company's exception to the injunction and accounting order of Judge Bourquin in the U. S. District Court of Montana shows that the Court of Appeals considers Judge Bourquin's inclusion, in the accounting order, of the use of the Callow cell as an infringement of Minerals Separation's patent to be warranted by the Supreme Court's decision and mandate ordering the accounting. Despite this decree, which dealt only with the payment of costs, the possibility of using the Callow cell in such a way as not to infringe is still a doubtful point. The question arises in the Miami litigation, which is not yet ended, the supplementary hearings in that case having been resumed recently after an adjournment. No matter what the decision may be, it is highly probable that the Miami case will be taken to the Supreme Court for final review, on a record that is considerably better, for the defendant, than the records in the Hyde and Butte & Superior cases.

Strikes

Industrial quarrels are not without a certain bitter humor. For instance, on the first page of our 'Review of Mining' we print the verbal exchanges that took place between the striking miners and the Alaska Juneau company. It will be noted that Mr. Fogarty—again an Irishman—and his friends are absurdly ignorant of the things concerning which they have been advising their following of malcontents. To suggest that the Juneau company is deriving profit from the high price of zinc and iron in its ore is hardly less foolish than to assume so confidently that the mine must be "on a paying basis" because it is being operated. Both of the two big companies at Juneau

have been working at a loss for at least two years, as everybody ought to know. In our 'Mining Summary' we give the text of a statement issued by Mr. R. C. Gemmell, as general manager for the Utah Copper Company. This contains the suggestion that the men elect a committee to represent them in consultations with the officials of the company. The purpose, apparently, is to set aside the labor agitator and invite the men to act through representatives of their own choosing, thereby ensuring a voice for the quiet and orderly element. Usually during strikes the noisy and anti-social element is to the front, the conservative men avoiding trouble by leaving the locality as soon as violence or disorder impends. Judge Gary's cross-examination by the Senate committee was interesting. The chairman of the U. S. Steel Corporation took a firm stand on his refusal "to meet outsiders who are trying to organize the steel industry," meaning the men employed in that industry. To recognize professional agitators would mean the end of the effort, made by him and his managers, to maintain the 'open shop'. He suggested that "concentrated labor," no less than "concentrated capital," should be "subjected to control of the Government and of the law." He believed that "if a certain vicious element is defeated in this country" we may have fewer strikes everywhere. There is justification for his refusal to meet professional agitators, but we see no reason why the men, any less than the companies, should not pay lawyers or other specially qualified persons to represent their side in a disagreement with the company or its officials, because the average worker is not competent to do so. The companies give a handle against them when they hire professional strike-breakers, men of the toughest type and at the best only soldiers of fortune, not genuine workmen, but usually inciters of disorder. The subsequent similar cross-examination of William Z. Foster, secretary of the steel strikers' organization, showed that he had been a rabid anarchist not long ago and that he had selected trades-unionism as a means for giving effect to revolutionary ideas. He acknowledged that "foreigners made up the largest membership in the unions at present." It is evident that he and his kind are opposed to Mr. Gompers and to the conservative element in the American Federation of Labor. The communities of Berkeley and Oakland, tributary to San Francisco, are paralyzed by a street-car strike caused by a demand for higher wages from a traction company that is on the verge of bankruptcy. The usual features of such a strike are in evidence, but the most interesting is the issuance of an injunction by a Federal judge forbidding intimidation, coercion, or interference on the part of the strikers against those willing to work. This is done upon the theory of a war emergency, the claim being made by the company that it is a war utility and entitled to protection under the Act of Congress of April 30, 1918. The question may reasonably arise whether this does not stretch the intent of the law unduly and represent an interference on the part of the Federal court hardly warranted under the circumstances, particularly as the Governor has not appealed for Federal assistance. Previously the

strikers had refused an offer of the City Council of Oakland to arbitrate the differences, although the traction company was willing to do so. To these notes on current disturbances of life and industry hurtful not only to the parties involved but to the whole community, we add the following observation. Last year only 3% of the American people paid income taxes, that is, belonged to the conservative or capitalist class; on the other hand the labor-unions have a membership amounting to about 4% of the population. Thus capital and organized labor together constitute 7%, and between them is the 93% that we call the 'public' whenever labor clashes with capital and both make life difficult for the community. This 93% ought to have more to say. At the time of this writing it seems as if the irreconcilable elements in the ranks of labor were about to fail in the attempt to dictate to the country, and as if the better element, led by Mr. Gompers and other sagacious leaders, would regain control of organized labor.

The Institute Meeting

A full account of the recent meeting of the American Institute of Mining and Metallurgical Engineers will be found in this issue. The meeting appears to have been well attended, and its success was only marred slightly by the strike among the steel-workers, which rendered it necessary to omit the visit to the Gary plant of the U. S. Steel Corporation. Including the ladies, about 850 registered. The program of papers was unusually long and varied; indeed, we approve the criticism implied by our correspondent, a graduated mining engineer, when he suggests that a large number of the papers are outside the scope and beyond the interest of the average member of the profession. We venture to suggest that the value of such meetings lies not in papers, many of them poorly prepared and of wearisome length, but in the opportunity for making men known to each other and for the informal talks that ensue between practitioners from every part of the country. Better than the technical papers, which interest a few, are the discussions on general subjects, which appeal to the many, such, for example, as the question of Federal taxation, which was brought before the meeting by Mr. L. C. Graton in a paper that we take pleasure in publishing in abstract in this issue and in the one to follow. Even this paper, good as it is, would have benefited from the intelligent use of the blue pencil—it is needlessly long and by its length tends to weaken the force of the argument that it presents. Such subjects of timely interest when presented by means of a short summary of the points at issue, without obscuring them with an elaborate dissertation, are admirably suited to general discussion. They help to make men mentally acquainted with each other. Our correspondent gives an interesting description of the tungsten refinery at North Chicago, which was one of the places visited. The banquet was successful in eliciting several excellent speeches. Mr. Horace V. Winchell, the president of the Institute, used his opportunity to urge a larger interest in civic and national affairs. The return of Mr. Hoover from

Europe gives point to such urging upon the profession to become politically minded, using these words in the broader and more correct sense of having an intelligent interest in all that concerns the life of a community and its relations to other communities. Mr. Hoover and the group of mining engineers that have worked with him constitute a splendid example of the useful—the supremely useful—participation of the mining engineer in national affairs. Mr. Schawb's speech must have been interesting because of the speaker's position in the steel industry, and his talk about human engineering must have pleased the efficiency experts, but we believe that a lot of the so-called human engineering fails for want of an 'e'—it would be better all round if it were not only human but humane. We would have liked to hear Mr. Theodore Robinson's speech, judging from such portions of it as our correspondent sends. He said a strikingly true thing when he asserted that "if there could be developed against the spendthrift and industrial shirker a popular sentiment akin to that which during the War obtained against the army slacker, the high cost of living and social unrest would soon disappear." We suggest that the shortening of hours and the increased wages paid to the manual laborer are not as portentous as the fact that he fails to carry out the implied contract, to do an honest shift's work. Not to do what one has been paid for doing is a form of taking money under false pretenses; it is dishonest, and by its dishonesty it corrupts the character of the man guilty of it. 'To deliver the goods' is an American phrase that embodies a sound bit of social ethics. It seems to us a pity that the speeches made at the banquet were not available as topics of discussion at the preceding sessions of the Institute; they would have elicited a better exchange of ideas and more opinions of general interest and usefulness than a paper on the heat treatment of duralumin or the pyrometry of a burning cigar.

Conditions in Siberia

By courtesy of a mining engineer intimately acquainted with conditions in Siberia, from which region he returned to San Francisco a few days ago, we are enabled to give the latest information concerning the impact of Bolshevism on mining in that part of the world. It will be recalled that early in June the Peace Conference at Paris, having received satisfactory replies from Admiral Kolchak as to the intentions of the government established by him at Omsk, declared that it was willing to assist him with munitions, supplies, and food, in order that his government might establish itself as "the Government of All-Russia." The agreement was signed by the premiers of England, France, Italy, and Japan, and by the President of the United States, but the fulfillment of this pledge was delayed, because a further inquiry was started before any assistance was sent, with the result that Kolchak's army suffered severe reverses and his government had to retire from Omsk. This, of course, affected mining operations adversely. Until July 25 the plant of the Kyshtim Corporation, a notable copper and

iron enterprise, was being operated by the Russian staff of the English corporation, but with the help and under the authority of the Siberian government, namely the party led by Admiral Kolchak. For months there had been no communication with the London office, the necessary financial arrangements being provided by the Siberian government, and these operations were fairly successful, that is, they were profitable in rubles. On July 25 the Bolshevik advance made it necessary to evacuate the works, whereupon, in order to prevent the operation of the plant by the Bolsheviks, all the essential parts of machinery were removed, together with the stocks of copper, gold, and silver. Altogether 80 carloads of material was removed. At the same time 350 of the *intelligentsia*, including families, were taken to Novo Nikolaievsk, where, without food or clothing, they await the oncoming of winter. The term *intelligentsia* as used in Russia signifies the intelligent members of the community in contrast with the illiterate mob to which Bolshevism makes its appeal. Meanwhile the copper mines of the Ural region, farther west, had been abandoned likewise, as soon as the Bolshevik armies advanced from Samara to Ekaterinburg. An attempt was made, during a brief interval between one Bolshevik occupation and another, to operate the copper-gold mines of Tanalyk, but unsuccessfully. When these mines were evacuated, the Russian manager was able to bring with him the quicksilver and bullion on hand. Nobody was killed. Ekaterinburg was the scene of a massacre. The refugees from this old mining centre in the Ural are now scattered over Siberia and from them our informant heard that the Bolsheviks had lists prepared beforehand, by their agents in the town, of those who were unfriendly to anarchy, and upon the arrival of the Bolshevik forces more than 2000 residents were taken from their houses and shot. Destitute and terrorized refugees from Ekaterinburg are now congregated at Barnaul, Ekibastus, and Simipalatinsk. The Spassky copper mine, a prominent and well established British enterprise, in the province of Akmolinsk, south-east of Kyshtim, was closed down, not by reason of Bolshevik irruption nor on account of any lack of labor, but owing to financial difficulties, the management being unable to come to an agreement with the Siberian government as to the price to be paid for the copper. No exportation, of course, was practicable; and the Government offered only 350 rubles per pood, equivalent to about 9 cents per pound of metal. The mill, for concentrating the lower-grade ore, was burnt down, accidentally, in August. Coming to the Altai country, which is south-east of Omsk, we learn that the Ridder mine continues to be under the protection of the Siberian government. This is true likewise of Ekibastus, where the Irtysh Corporation has its coal mines, as well as its lead-zinc smelter. The coal mines are being operated vigorously, 60% of the output being taken by the Siberian government for railroad use. Coal is also being supplied to the new line now being built, for military purposes, from Semipalatinsk southward to Sergiopol, near the Mongolian frontier. The remainder of the Ekibastus coal is being bartered for supplies that the management expects

to find valuable later—at least, more valuable than paper rubles. The Russian Mining Corporation at Zmeinogorsk has been able to continue its prospecting campaign without financial assistance from the home office, in London, the revenue from trading having sufficed to meet the payroll and other necessary expenses. The Atbasar copper mine, which is isolated, is not being worked and probably has escaped Bolshevik sabotage. The trans-Siberian railroad is being operated successfully from Vladivostok to Omsk by the commission of American engineers under Mr. John F. Stevens. Westward from Omsk to Ekaterinburg the railroad was in the hands of a British military mission under General Jack, a man of remarkable ability as an organizer. He managed to save 95% of the rolling-stock, amounting to 25,000 cars and 500 locomotives, from Perm and Ekaterinburg at a few days' notice, in July, when the Bolshevik advance was made. This advance was rapid not on account of the progress made by the revolutionary army itself but by reason of the Bolshevik propaganda, inciting riots and uprisings in the towns, in advance of military occupation. Such uprisings would begin by men on armored motor-cars careering up and down the streets, shooting and terrorizing the population so that they stayed indoors and surrendered control. As regards Admiral Kolchak, our informant says that he is well worthy of support. Any government working under such manifest disadvantages must have weak links in its chain, but the Omsk government is, he believes, sincere and well intentioned. Some of the methods employed, of course, are arbitrary, because conditions necessitate prompt action. The whole country has to be under the strictest military control and there is no time for quibbling over questions of jurisprudence. Reports of intrigue and graft are common, and there is some truth in them; on the other hand, instances are more frequent of summary justice being meted to those who have attempted to bribe government officials. The government of Kolchak is radical, of course, in its views concerning the relations of capital to labor and intends that the living conditions of the work-people shall be bettered. There was a reactionary clique at Omsk, but it did not dominate. Kolchak himself is a patriot and a man of well-balanced mind; in him lies the hope of keeping Siberia out of the slough of anarchy into which European Russia has fallen. Questioned as to the future of Siberia, our engineer states that he believes the tide of Bolshevism will be stayed and that in due course the Government will render life and property secure. He expects the Bolshevik army to be driven back, relying upon General Denikine, who is advancing upon Moscow from the south, in co-operation with the Siberian army. This army is partly volunteer and partly conscripted from the young Siberians that have reached military age since the revolution in 1917. The Czechoslovak contingents are withdrawing toward Vladivostok, with the idea of returning home, so that only small detachments of them remain to guard the railway. No British or American troops are now at the front, but some remain to guard the railway, with a Japanese contingent.

DISCUSSION

A Message From South America

The Editor:

Sir—As one who has lived in six different countries during the past 17 years, including eight and a half years in Mexico and Peru, I would like to make some comment on the remarks made by 'Mining Engineer' under the above heading in your issue of September 13, as I think it is time some one took up the cudgels on behalf of the Spanish-American republics and people.

All that is said regarding hygiene, honesty, cleanliness, and educational facilities I agree with; in fact, there are one or two more arguments against Spanish America that 'Mining Engineer' failed to mention, though I take exception to the remarks on the food question, as it has been my experience that it is only in outlying camps or isolated sections that one cannot get proper food.

Having stated the case *en contra*, let us see if something cannot be said *en pro*. First of all, why do foreigners go to Spanish-American countries? While some are actuated by a spirit of adventure and a desire to probe the unknown, is it not true that the great majority travel south of the Rio Grande because they expect to make more money than they do on the north side of that mis-named stream? This fact in itself is some recommendation. Another reason why foreigners go—or more correctly, why they return—to Spanish America is that there is a certain charm about the free-and-easy life that one leads there, an undefinable attraction about the last-century atmosphere in which things move more placidly, and the nerve-tension is less than under our modern high-speed conditions. They will curse all these things most heartily at times, but it is most remarkable how they go back to the Spanish countries. After a person has become established and has learned the language, a new world opens to him, rich in history and letters well worthy of consideration. If he takes the trouble to study the people and get acquainted with them, he will find the better-class educated Latin a very agreeable and courteous fellow with some characteristics to be appreciated.

It is hardly fair to make a direct comparison between the U. S. and the South American republics, as the latter are in a comparatively crude and undeveloped condition. Just how many decades they are behind, I am not prepared to say, but any intelligent Latin-American will join with the foreigner in deploring the backward condition of his country and in welcoming improvements; so that, any criticism of Spanish-American countries must be tempered with consideration of conditions

and people as they are, and not as we think they ought to be. Lack of population brings in its train scarcity of public funds, and, among other things, the consequent inability to launch a comprehensive educational system necessary for the formation of an intelligent public opinion, which is the real motive force in a republic. The difficulty of educating natives of the lower classes is apparent to anyone acquainted with, say, the Peruvian *cholo*, and without a good public opinion it is impossible to advance very far or to develop a national spirit. I think I am right in saying that, up to the time of the outbreak of the great war, serious attempts were being made to improve educational facilities in the South American countries.

I hesitate to believe that there is anything to fear from the Latin-American professional or commercial man who comes to the U. S., as, in the majority of cases, he comes to get experience or education which will enhance the value of his services when he returns to his native land. Surely there is no fault to find with this. Mining students used to go to Freiberg or some other European school before the American colleges were so well established.

In a comparison between countries, it must be borne in mind that no particular country 'has it all'. Each country has something that the others lack, for which reason it is always regrettable to hear anyone say that some particular country (I care not which it may be) is the only one fit to live in. I therefore wish to repeat, in defence of the much-maligned Spanish republics, that there is something about them which appeals, especially to the person who approaches them with an open mind, that there is some good in them, and that one may get quite a lot out of life there if he goes about it in the right way.

Regarding the boys who went overseas, it was precisely that "high-speed education in national values," which 'Mining Engineer' mentions, that prevented their forming any proper conception of the countries they visited; in other words, they did not stay away from home long enough to acquire any real national values. They are not altogether to blame for the ideas they brought back; they probably could form no others under the conditions and in the comparatively short space of time at their disposal, though many of them failed to realize that they were sojourning in countries racked and torn by three years of desperate struggle, in which the usual course of life was upset and everything was subservient to the needs of war. I claim to know whereof I speak, as I was in London during the last 16 months of

the War and took occasion to talk with many men of the A. E. F. Hence my belief—which has been strengthened by my observations since returning to this continent—that the men who went overseas did not come back with that appreciation of other lands that they would have had if they had stayed away longer. We hear so much nowadays about the brotherhood of nations, especially among the Allies, but there will be little meaning in this till we look more sympathetically and appreciatively on other lands; and, so that I be not misunderstood, let me state here that the Americans are not the only people to whom this admonition applies. Straws show which way the wind blows, and the doughboy's remark about his home town was probably due to the fact that he found himself in a place where the language, manners, and customs were different from those to which he was accustomed, and were therefore no good. He missed the corner drug-store and could not find the restaurant opposite the depot on Main street. If travel broadens the mind, then let us have some expansion of viewpoint and a desire to understand the other fellow and his way of looking at things. Even within the boundaries of the U. S., provincialism seems to be on the increase. One notices it continually. I heard a man from a neighboring State say in all seriousness on landing in Oregon that he could not understand why anyone should leave the United States (?) to come to a country like that (I'll admit it was raining at the time); and the terrors of the wild country a hundred miles west of Broadway seem to have a very real meaning to the inhabitants of a famous Eastern city—more straws, but they show tendencies nevertheless.

Finally, with regard to the American national spirit, by all means let us have it in plenty, but I don't think it needs any forced culture. It already exists, strong and aggressive. When the call came there was no more provincialism, but a united country, and the war effort of the U. S. is something to be so justly proud of that it calls for an abler pen than mine to describe it. But let this national spirit be broad and liberal enough to enable us to realize that there are other countries whose history and traditions are equally as great as ours, so that we rise superior to the narrow viewpoint of 'we first, the rest nowhere'.

Perhaps I am too much a cosmopolitan, so if I have misunderstood 'Mining Engineer's' meaning, *le pido perdon de antemano*.

OLIVER E. JAGER.

Mining on the Mother Lode

The Editor:

Sir—Referring to the editorial in your issue of September 13, commenting on the query of the mining engineer from Denver, who asked if the Mother Lode country was doing much mining, I should like to add my testimony regarding the increased mining activities of this region since the War ended. Development has increased

by rapid strides, and no doubt this would have been a record year for the State of California if it had not been for the labor unrest such as that in the Grass Valley district. This, I am pleased to say, has returned to normal conditions. Once more, thus giving the State a chance to make a good record in the production of metals during the coming year. If the mining industries of this State received greater publicity regarding their development in the various districts, the mining engineers of this country would realize that California was still a great producer and would be for years to come. My belief is that this State contains untouched orebodies greater than those that have been mined, although this optimism will doubtless surprise many Californian mining engineers. I wish that you could publish more articles showing the active work that is being accomplished, and thus enlighten our friends.

HARRY S. CORDELL.

Grass Valley, September 13.

The Problem of Capital and Labor

The Editor:

Sir—During the last few months the point of view of Capital has been thoroughly aired in technical journals and societies. The statements by W. R. Ingalls have been especially notable to mining men because they are so assertive of the lack of necessity for reform and so oblivious to the arguments advanced by Labor.

Briefly, the case of Capital is: (1) That it is the owner of plants, equipment, appliances, and other facilities which are necessary for the economic production and distribution of the commodities required for the well-being of the world. (2) That the greater part of the cost of raw materials, and ultimately of manufactured goods, is paid out as wages to the labor employed in producing them. (3) That mines, factories, or other units of Capital are for the most part operated in competition with other similar concerns and that by this means the profit is reduced to a minimum. From this point, the argument is obvious. The raising of wages, or reduction of hours of labor, raises the price of commodities, and Labor, being the principal consumer, has to pay more in proportion; nevertheless, the conditions of competition between the various units of Capital are not altered, and in the long run Capital must take the same percentage of profit.

The case of Labor has always been that there is an unnecessary and unnatural disproportion between the standard of living maintained by most rich people and that maintained by working people. This, it will be remembered, was the stimulus which led Henry George to study economics and ultimately to suggest the single tax system in his well known book 'Progress and Poverty', afterward translated into so many languages. It is quite logical that, with only this phase in view, ignorant peoples, such as the Russians, should take the situation by force and try to reduce all people to a single grade of living. The more intelligent laborers of other countries, under the tutelage of such stable-minded men as Samuel

Gompers, have seen that there is some reason in the case presented by Capital. They have realized that the controller of capitalistic enterprises can multiply his time and energy by having personal attendants and by being surrounded with other comforts and facilities, the like of which cannot be afforded by the laborer.

The viewpoint of Henry George was that in manufacturing businesses there was so much competition that such industry could not be a cause of the oppression of Labor. He considered, however, that there was not sufficient competition between the owners of rich agricultural lands because such lands were limited, but that all capitalistic concerns were connected to and controlled by agriculture because they drew in the long run a similar percentage of profit, rent, or dividend.

With the progress of the United States it has been proved, however, that most agricultural lands are only profitable when held by small owners who work themselves, and that the extraordinary development of manufacturing businesses, with the preservation of competitive conditions within the country, has not modified the disproportion in the standards of living. We are therefore brought to face the same problem that Henry George failed to solve, but with the advantage of facts which he did not possess.

In general, economic adjustments are made by the natural law of supply and demand, the only condition for the fair operation of such a law being the existence of enough competition. There are, however, phases which from their very nature are not subject to such a law. There is certainly sufficient competition between manufacturing concerns, and for this reason it is generally assumed that the profits of such concerns are wholly determined by that competition. The fact is, however, that the way profits are expended has also an important, though indirect, effect in fixing the amount of profit.

Profits are necessary for two purposes: (1) To supply capitalists with a living; (2) to build the extra plants, equipments, appliances, and other facilities that are required for an increase of population and of efficiency in labor and technical methods.

Unfortunately there is no competition in the conservation of capital. Any individual may consume his capital or all his profits by maintaining a standard of living which is entirely unwarranted by the amount of the capital. It would, therefore, seem that the just objection of Labor should not be to the possession of productive industries by Capital, but to the dissipation of capital, using the term dissipation in its broadest sense.

A wealthy Englishman writes me that he considers wealth just as well conserved if spent in high living as if invested in industries. He no doubt has in mind the general idea about prosperity being promoted by keeping money in circulation. This effect is, at best, a subsidiary one and only follows under certain conditions. In reply to him I gave a clean-cut example, which, I think, may be profitably repeated here. Suppose a certain individual falls heir to a large factory. He lives highly and has finally to liquidate his estate, so that after a number of years he has nothing left. The factory was an enter-

prise giving employment to labor. It continued to exist in other hands and therefore it might appear that no wealth had been lost to the world. The material, service, etc., used in high living was actually consumed, destroyed, and forgotten. But had the labor and material been employed in building another factory, the world would have that much more wealth. The individual in question would only own one factory, however, and it might be said that he had exchanged the old one for the new. By expending his capital in high living it may, therefore, be said that he destroyed his factory without leaving anyone any benefit of it.

From a general knowledge of the world, such as anyone may pick up, I cannot help considering that as much capital is dissipated every year as is invested in new industries in the same time. This is the same as saying that half the profits of industry are dissipated. Those in control of capital should hardly be opposed to some regulation to correct the want of competition in these matters. If such men as Carnegie, Morgan, and Rockefeller lived a comparatively simple life and reinvested most of their profits, it is hard to imagine why they should not wish their heirs to do likewise. The great advantage to Capital, however, would be in the elimination of friction between Capital and Labor, for it would become obvious that any readjustment of wages, which would crimp Capital, would in the long run injure the interests of Labor. This effect is not certain under present-day conditions, a fact that labor fully realizes.

BLAMEY STEVENS.

El Paso, September 9.

War Minerals Relief Scandal

The Editor:

Sir—Naturally a great many readers of America's two leading mining papers followed the controversy between the editor of one and the editor-elect of the other. The vast majority, of course, knew no more of the facts than was revealed by the writings of the two principals, but that did not prevent their taking an interest in the matter or forming an opinion on the apparent merits of the case. As one of those readers, may I comment briefly on the matter?

Everyone whom I have heard remark upon the matter agrees that the attacking editor once more proved himself a skilled dialectician—as was his teacher Huxley. In following the stand of "the Chief Engineer for investigative work under the Act," I could not help thinking that his was the typical point of view of the high-placed Government official. The American official, of course, is a man of extraordinary merit, but he cannot act as he might personally, when he is part of a system. The system that administers a Governmental bureau has little time or encouragement to enquire closely into the case of an individual who may be getting treatment short of justice. Decisions have to be made promptly with no after-thought, and in case of doubt a subordinate is merely "relieved of further responsibilities". That the Chief afterward explains that "no onus was involved"

may cheer up the injured party, although it does not sound especially cheerful. It appears to me that such an incident has a bearing on the subject of Government ownership, particularly on the contention of the editor of the 'Edinburgh Review' that nationalization would create a machine too big for any man to handle and would kill the human element in industry.

There was some reference during the controversy to "the yellow press". In view of the number of times that 'yellow journalism' is referred to nowadays, would it not be well to define just what the term means?

P. B. McDONALD.

New York University, September 13.

[The reference to yellow journalism was an expression of spleen, and was not taken seriously by us. When men are the object of adverse criticism they are prone to throwing such epithets at their critic. Every self-respecting editor has to risk that.—EDITOR.]

Technical Writing

The Editor:

Sir—I was interested in reading the article 'Technical Writing: Slovenliness' in your issue of July 26.

I agree with you that "engineers should keep technical words for appropriate uses, otherwise they lose their significance". We all get careless, and then again some of us do not know any better. For example, the definition of the word 'tunnel', or rather its significance, as explained in the article referred to, I do not agree with. We all know that a 'tunnel' in its general sense is a bore going through a mountain from daylight to daylight. It may be used for a railroad, a wagon-road, an aqueduct, or any old thing; but according to my vocabulary, and understanding of mining parlance, a 'tunnel' is a bore that goes into a hill or mountain from daylight, horizontally, through country-rock, and not necessarily daylight at both ends. An 'adit' is the same thing, except that it is driven on, or follows, a vein. I would not call the Argo bore, at Idaho Springs, Colorado, an 'adit'; to be precise I would call it a cross-cut tunnel. And by the same token I would not call the adit-levels on the Sunnyside mine, 'tunnels'.

Of course, if we take Webster's definition for the two words, or the 'Glossary of Mining Terms', in Morrison's 'Mining Rights', I may (or may not) be wrong.

Speaking of mining terms, we meet up with some that are peculiar, some that are very pat, and a lot of misnomers. We often hear the remark, "It has the earmarks of a mine". I suppose if they were mule ears it would be a big mine.

The remark, we so often hear, "Ore is where you find it", always reminds me of the old Cousin Jack (Cornishman) tributer, when asked how his 'pitch' was looking, who said: "Thee knows 'ow they bloody h'ore ez, me son, sometimes ez 'eer and sometimes theer, and weer 'ee edden, theer be oi". In plain English, "You know how ore is, my son, sometimes it's here and sometimes there, and where it isn't there am I." I claim that to be pretty pat.

Some time ago I read a report on an Amador county property. It wound up by saying, "The gold in this mine is worth \$20.67 per oz." I had always been under the impression that all gold was worth \$20.67 per oz. Accompanying this report was a plan and vertical section, of the property, all in one. Possibly the maker could understand it, but I couldn't.

CLARENCE K. COLVIN.

Los Angeles, August 30.

Metallurgy at the Afterthought Mine

The Editor:

Sir—In your issue of September 20 there appears the fifth installment of Mr. Herbert Lang's metallurgical journey to Shasta county. In this article he mentions the Afterthought and boldly states that the net result of the work done at the Afterthought thus far "has been the accumulation of over 7000 tons of flotation concentrate as yet unsold, of which 5000 is reported to contain 35% zinc, 4% copper, 6 to 8 oz. silver, and 30 to 40c. in gold. Another lot, estimated at 2000 tons, contains 22% zinc, 5% copper, and 8 oz. silver."

As regards the 5000 tons mentioned above, Mr. Lang is entirely wrong. There is nothing of the kind here and never was. A good tonnage of zinc concentrate was shipped, averaging over 41% zinc, or well above the zinc content given by him. A substantial payment is made for both the copper and silver contained in the zinc concentrate, and therefore not a loss as suggested by Mr. Lang. There was, however, about 3000 tons of concentrate on hand, largely collective, or product on which no attempt was made to effect a separation into zinc and copper concentrates. This product is now being smelted with copper ore, practically free of zinc, direct from the mine; and notwithstanding a high zinc content in the calcine delivered to the reverberatory, a considerable tonnage is smelted, yielding a matte of satisfactory grade and a slag very low in copper and the precious metals. Of course, a large loss of zinc must follow from such a practice, as was expected at this time.

Mr. Lang's remarks concerning the Afterthought might convey the impression that all efforts to work out a treatment process for such ore as the Afterthought mine affords have failed. We certainly do not believe so, and in justice to certain competent men who have been associated with us in a real honest-to-God effort to unearth a process whereby such complex ore could be made to yield a profit, and thereby make valuable a property which hitherto was neglected because the ore could not be treated at a profit, we ask that you cause Mr. Lang's statements to be corrected.

The flotation process in mind was really proved a commercial success, and has been abandoned only because a more suitable method grew out of it. We invite honest and constructive criticism always, because there was neither precedent nor sign-post to point the way. We were pioneering.

JOHN TAIT MULLIKEN.

Ingot, California, September 29.

Reminiscences of Dr. Raymond

By T. A. RICKARD

Early in 1891, on my way from New Zealand to France, whither I had been called by my father to take charge of a group of mines near Allemont, in the department of the Isère, I called at the office of the American Institute of Mining Engineers, which then was domiciled at 13 Burling Slip, below Wall Street. My purpose in calling was to make the acquaintance of the Secretary, Dr. Raymond, with whom I had been in correspondence, while in Australia, by reason of my first contribution to the Transactions, a paper on the Mount Morgan mine presented at the Cleveland meeting in June of that year. On being ushered upstairs into a cheerful room overlooking the water, I found two gentlemen in conversation. One of them, wearing a black silk cap, arose to greet me most politely and, in the act of shaking hands, asked: "Which one are you: Colorado, California, London, or Australia?" I knew what he meant; he wished to know which of the Rickards I was; for at that time our family had four or five representatives in the Institute. I answered promptly: "Australia"; whereupon he said: "Then let me introduce you to Mr. Emmons. We have just been discussing the origin of the masses of kaolin in the Broken Hill lode. What is the source of the kaolin?" I replied: "It is the product of decomposition from the feldspar in the wall-rock, which is gneiss." Thus I made my first acquaintance with two men whose friendship I am proud to have won later, for I did not begin to know them intimately until five or six years subsequent to this first meeting.

From France I sent to Dr. Raymond, for the Transactions, my contributions on 'La Gardette: The History of a French Gold Mine' and 'The Bendigo Goldfield', the latter the first of three papers on the famous old mining district in Victoria, Australia. These were presented at the meetings in October 1891 and February 1892, respectively. Within three years—1892 to 1894—I contributed nine papers to the Transactions. This literary activity was due in no small measure to the encouragement given by the Secretary, in whom I found not only an editor of extraordinary ability but a friend rich in stimulating helpfulness.

My second call at his office was in January 1892, about nine months after the first visit. I had come from France to New York to serve as assistant to the late George Cowland, who was acting as consulting engineer to H. H. Warner, of 'Safe Cure' fame, a promoter of engaging personality and, as I found later, of fluid integrity. At our second meeting Dr. Raymond mentioned that Emmons had made the criticism that I was not sufficiently careful in orienting my geological drawings. The Doc-

tor bubbled over with cheery humor and pertinent information. I made the most of my privilege to discuss his editing of my contributions and to gain from him suggestions helpful in my next writing.

In the summer of 1892, while at Prescott, Arizona, I received a letter from Dr. Raymond stating that a Mr. Dunn had written to him from Australia charging me with plagiarism of his ideas on the structural geology of Bendigo; in short, Mr. Dunn claimed that my explanation of the lode-structure had been taken from him, without acknowledgment. When I read the first part of Dr. Raymond's letter I was dismayed, as might well be supposed, for this was a bolt from the blue. On reading further I found compensation; for the Doctor proceeded to say that I must not worry, the charge was refuted by the internal evidence of the text, the character of which afforded strong disproof of any such accusation. He enclosed a copy of his reply to Mr. Dunn, defending me even before he had received my denial. It was a striking proof of his confidence in my scientific sincerity, and it is worthy of record as testimony to the generosity of his mind. I wrote at once to disabuse him of the idea that Mr. Dunn was a man of no consequence, explaining that E. J. Dunn was a veteran geologist and a high scientific authority. At the same time I wrote to Mr. Dunn myself and told him that if he would withdraw his imputation I would explain how he had been misled and I would meet his criticism in a friendly way. Among the 'Errata' at the end of Volume XX of the Transactions will be found a note, by the Secretary, dealing with this incident. I need not go into it further, except to add that four years later Mr. Dunn cabled to me from New Zealand offering me an appointment as engineer to an important mining enterprise, and, when declining it, I was able to express my hearty appreciation of his good-will.

At the Chicago Exposition meeting in 1893 I had my first opportunity of watching Dr. Raymond in action, of observing how he managed the sessions and guided the discussions. His speech at the closing session of the International Science Congress, a foregathering of scientific men attracted by the Exposition, was in his best vein. The preceding speeches had been rather dull and several of the representatives of foreign countries had made the mistake of speaking bad English instead of good French or German. Hence it was a relief to listen to an accomplished speaker like Dr. Raymond. He arrested the attention of the audience at the start by saying, not 'Gentlemen', but 'Brethren'; and then, explaining that he had been called upon to respond for both mining and

metallurgy, he likened himself to the camels conspicuous in the Exposition grounds, because he had to "hump himself two ways," and so gave a humorous touch that put everybody at ease. Reviewing the proceedings and summarizing the results of the international gathering, he placed his finger on the significant feature of the conference, telling his audience that while they had brought forward new ideas and uncovered new principles, they had done even better, for they had "discovered one another."

In 1895 I was established as consulting engineer at Denver. Business was dull, so I was delighted to receive a letter from Dr. Raymond asking me to be his assistant in an examination of the Drumlummon mine, owned by the Montana Mining Company, an English corporation. He offered me a fee larger than I would have asked as a principal, and I mention the fact to illustrate another phase of his generosity. It was agreed that he should pick me up at Denver. When he arrived I arranged a luncheon in his honor at the Denver Club. The party included Thomas B. Stearns, Henry T. Rogers, Dean Hart, Dr. W. A. Jayne, Richard Pearce, and my brother Forbes. I knew that Mr. Pearce, who is now 82 and living near Liverpool, had had a falling out with the Doctor. The incident was characteristic. When Mr. Pearce was president of the Institute in 1889, he was presiding at a meeting, at Denver, to which the Secretary was late in coming. The President waited for the Secretary; he delayed the opening of the proceedings for ten minutes or more, expecting the Doctor to arrive at any moment, until it seemed proper to wait no longer. So the session was started with the reading of a paper, and this was hardly begun when the Secretary walked into the room carrying his dossier of papers and looking black as a thunder-cloud because the President had dared to begin the meeting without him. Unfortunately the two distinguished gentlemen did not come to a friendly explanation on the spot, and a coolness ensued. Mr. Pearce had told me the story, with regret. It is more than likely that the Doctor had forgotten all about it, but Mr. Pearce, a gentle man, felt uneasy lest the feeling of annoyance might have survived after many years. When our luncheon was coming to a close I decided to propose the health of our honored guest, desiring to bring him to his feet and feeling confident that he would make a delightful speech. As I was about to rise, Mr. Pearce, who sat on my left, said, "Mr. Rickard, will you allow me?" I said, "With pleasure." He rose and proposed Dr. Raymond's health in a charming little speech, conveying a friendly greeting, to which the Doctor responded in a similar spirit. He made a speech worthy of a bigger occasion, reviewing his early experience in Colorado and his contact with men prominent in the development of the local mining industry. Cordial relations were restored between the Secretary and the ex-President, although none of the other guests understood the significance of their fraternization.

Next day the Doctor and I took train for Butte, going

thence to Marysville. During the journey we played chess, for he usually carried a set of chess-men; at other times he studied chess problems or read fiction. He was fond of Anna Katherine Green and Gaboriau detective stories and other light literature, because they afforded him mental relaxation. He talked a good deal and always interestingly, having an extraordinary fund of diversified knowledge. Among other matters I touched upon the early days of Leadville and the Chrysolite deal. The older men in the profession will recall the fact that the Doctor was mixed up in a mining scandal arising out of an over-valuation of the Chrysolite mine, nearly forty years ago. When I first went to Colorado, in 1885, that affair was quoted as a blow to the profession because it had hurt the reputation of an engineer so distinguished as Dr. Raymond. The Chrysolite was a rich silver mine and was the cause of much stock speculation on the New York mining market. An engineer whose name I forbear to mention¹—let us call him Blank—was the manager. He had been a junior when Raymond was a senior at Freiberg and the Doctor had been a good friend to him at the Mining Academy, and afterward when Blank started his career in the West. The Doctor was engaged to examine and report upon the Chrysolite. He went to Leadville. As he trusted Blank, he accepted his statements about the quantity of ore in reserve, and did not sample the mine thoroughly. One large block of ground appeared to be solid ore and its appearance was confirmed by the manager's statements; so the Doctor made a highly favorable report, which caused quotations to rise in New York. The fact was that the block of supposed ore contained a large core of limestone, as was known to the management through a cross-cut, the position of which had been hidden. When later the truth became known there was a slump in the shares and Dr. Raymond had to submit to severe criticism. Much to my surprise, when I touched upon the subject during our journey to Montana, he said nothing against Blank. Apparently he cherished none of the resentment that would have seemed natural under the circumstances. Some years afterward, in 1902, he was approached by a famous mining engineer, then engaged in the promotion of mining schemes, with a view to his writing reports, on the understanding that the sampling should be done by younger men. He asked me, at Philadelphia, what I thought about it, and I urged him not to consider the proposal for a moment. "Remember the Chrysolite," I ventured to remark. The truth is that in business matters he was too trusting and too generous to succeed, especially when dealing with persons unhampered by scruples of conscience or a sense of honor.

On arrival at Marysville we were the guests of R. T. Bayliss, the general manager for the Montana Mining Co. Ltd. Charles W. Goodale, consulting engineer to the company, was also there. The gracious hospitality of Mrs. Bayliss and the company of such men as Bayliss.

¹I am prompted to this reticence because I feel sure that Dr. Raymond would have wished it.

Goodale, and the Doctor made the dinner at the end of the day's work a delightful social function. As the Doctor's assistant I did most of the physical examination of the mine, and when, at the end of a week, the inspection was completed, we collaborated on the report. Our duty was to make suggestions for the further exploration of the mine, which was showing signs of impoverishment, basing our advice on geologic evidence, particularly of a structural character. If I recall correctly, we made five recommendations, three of which the Doctor was kind enough to accept from me. When the report was finished, he insisted upon my signing it with him, so that it became our joint report. Again he proved his generosity, for it was a great honor to me to have my name coupled with his in a report that was to go before an important financial group in London. Our stay at Marysville was made memorable by his vivacious conversation. The evenings were spent delightfully. He proved himself adept in whist, as well as a remarkably good chess-player. Indeed, in chess he achieved distinction; for example, he was selected as one of five to play against Pillsbury in a contest at Brooklyn; he once drew a hard-fought game with Steinitz; and in 1908, when a passenger to Europe on the 'Oceanic', he led a group of players who accepted a challenge for a match by wireless telegraphy from a similar group of passengers on the 'Campania'. The team he captained won, thanks to his leadership.

In 1900 Richard P. Rothwell asked me to join him in the editorship of the 'Engineering & Mining Journal', but when I discussed the matter with Dr. Raymond he advised me against the step. When later, at the end of 1902, I went to New York to take up the editorship of the 'Journal', which had passed, on the decease of Rothwell, into the hands of James H. McGraw and then into those of the late W. J. Johnston, I received a cordial welcome from the Doctor. Just at this time unfortunately he had to take a holiday in Europe, to correct the bad effects of over-work, so I missed his guidance when I first took the helm of the 'Journal'. During the three or four months while he was absent I edited many of the papers that appeared in the Transactions and on his return I accepted payment in the agreeable form of a number of back volumes of the Transactions, so as to complete my set. He was still a 'Special Contributor' to the 'Journal' and enriched its columns with an occasional letter or signed article. In 1903 he became interested in a controversy over the New York State College of Forestry at Cornell, and took up the cudgels in behalf of his friend Bernhard E. Fernow, who was then director of the College and is now Dean of the similar college in the University of Toronto. The Governor of New York had vetoed further State aid to the College of Forestry and it was claimed by Professor Fernow's friends that he had been influenced by a group of bankers, who objected to the logging operations near Saranac lake because it interfered with their shooting. Dr. Raymond sent me a letter on the subject, for publication, with the statement that it would be followed by six more. It seemed to me to be unsuitable for publication in the 'Journal', and, upon con-

sulting the late Frederick Hobart, of Brooklyn, who had been a faithful assistant to Rothwell, as afterward to me and to W. R. Ingalls in turn, I learned that the controversy was of a locally political character, rendering it undesirable in our columns. It had nothing to do with mining, even indirectly. After consultation with Hobart, I wrote to the Doctor stating that I could not see my way to publishing his series of letters on the subject.² My declination was couched, of course, in terms most friendly and respectful, but he was so annoyed that it was a long time before he would write again for the 'Journal'. He did not like criticism or opposition—nor do any of us, for that matter—and I remember his asking me if I had seen a certain article of his in 'Cassier's Magazine'. I replied, "Yes, I enjoyed it very much." Whereupon he exclaimed, "You could have had it, if you had not turned down those forestry articles of mine." I told this story one day to a mutual friend, who was quick to ask how I would like to have an article of mine 'turned down'. Then I remembered how, in 1904, I went to Dr. Raymond, as Secretary of the Institute, to offer a paper discussing the recommendation of a committee of the four engineering societies on standardization of abbreviations, symbols, punctuation, etc., in technical papers. These recommendations had been printed and circulated with the current pamphlets of the Institute.³ He demurred to publishing my criticisms, because he thought it inadvisable to start a discussion on the subject, the Institute—or he as secretary-editor—having no desire to impose its style on anybody. I accepted his decision cheerfully and later the rejected paper became the groundwork of my little book on technical writing, published in 1908.

During the three years of my editorship in New York I was on the council of the Institute for a time and also a member of the first board of directors when the Institute was incorporated in 1905. The council, including the president, vice-presidents, managers, treasurer, and secretary, numbered 18, but the average attendance at the meetings was only 5 or 6. Those not present would be informed by the Secretary of the decisions reached in council and would send their approval by postcard. Dr. Raymond 'ran the show'. If any of us disagreed with his plans, he overwhelmed us with reasons in support. We recognized the futility of opposition, and, it is fair to add, we appreciated his thorough grasp of the position. As my office was not far away, I was a steady attendant at the meetings, and I found them interesting, simply because Dr. Raymond never was anything else.

At one of the last meetings that I attended, in the spring of 1905, the question of placing advertisements in the Institute bulletin was broached. I objected to the proposal, whereupon the late George W. Maynard, half in fun, suggested that my interest in another publication—the 'Journal'—was at the bottom of the protest. The Doctor interjected a friendly correction, saying that

²In a recent letter to me Professor Fernow says that he is glad I did not publish the letters, "for it would have been of no use and would simply have made bad blood for him."

³They will be found in Vol. XXXV., pp. 342-346.

there was no doubt of my loyalty to the Institute and no reason for impugning the sincerity of my motives. Nothing was decided at that meeting. Before the next one was called I went on a short visit to London and being a member of the council of the Institution of Mining and Metallurgy I attended a meeting at which, it so happened, this very subject of advertising was brought forward. The council of the Institution decided that it would be 'bad form' to sell the pages of its bulletin to advertisers, so the proposal was tabled promptly.⁴ On my return to New York we had a meeting of the Institute council at which the subject was again brought forward by the Secretary. I objected again, and was supported by the late A. A. Blow.⁵ (Again the prefix 'late'! It is saddening to realize how many of these old friends have crossed the range). I suggested that the step was too serious to be taken by the small proportion of the council there present and that a fuller attendance was desirable before committing the Institute to such a radical departure. Dr. Raymond concurred. Soon afterward I left New York. In December of the same year, there came to me, in San Francisco, a circular stating that by "unanimous agreement" of the council, it had been decided to insert advertisements in the bulletins. I wrote to the Doctor, protesting that the decision could not have been "unanimous," because I was opposed to it, and Blow also. He replied that soon after I had left New York he had called a special meeting of the council, there had been a large attendance, he had explained at length the reasons for accepting advertisements, and he had done this so convincingly that everybody present had acquiesced, and if I had been there I also would have acquiesced! I appreciated the humor of the position and accepted it without further demur. This expression of confidence in his ability to persuade me if I had been present was characteristic—and the chances are that he would have persuaded me, by the eloquence of his argument, against my better judgment. He had a way with him!

I recall a delightful day—a Sunday, in April 1902—spent at the Doctor's home at 123 Henry street, Brooklyn. Robert M. Raymond⁶ (now Professor of Mining in Columbia University) and I crossed the East river in time to attend the service at Plymouth Church, in company with the Doctor, Mrs. Raymond, and Miss Susan Raymond. We heard the Rev. Newell Dwight Hillis deliver a powerful sermon. After the mid-day dinner we went

to the Sunday-school, which was directed by Dr. Raymond. He had been superintendent of it for 25 years and had resigned several years before, but the death of his successor had caused him to resume the duties of the position. He also conducted a bible-class, which Robert Raymond and I joined. It was immensely interesting. The Doctor's subject was the life of St. Paul. He began where he had left off the Sunday before, as if the break had been a minute, instead of a week, and poured forth a wonderful story, characterized by humor, erudition, and religious sentiment. When five o'clock arrived, the ringing of a bell called a halt, the bible-classes stopped, and the Doctor left us promptly to ascend the rostrum and conduct the closing service. The last hymn sung that afternoon was one that he had composed. Then we returned to the house and later accompanied the Doctor to the house of his aunt, a distinguished old lady, Mrs. Howard, where it was the custom for the Raymond kin to foregather at a prayer-meeting every Sunday. Then followed the informal evening meal, or 'supper', after which, I remember, the Doctor read one of Kipling's jungle stories, 'Rikki-tikki-tavi', delightfully. More good talk followed and finally he sent us back to the Brooklyn Bridge terminus in his brougham. The incidents of the day illustrated his versatility and also how entertaining he could be at any time or place.

More than once when I asked the Doctor to give me ten minutes of his time he would explain how busy he was and then talk for half or three-quarters of an hour. This seemed inconsistent. One day, meeting his brother, Colonel Charles W. Raymond,^{*} I asked him if he had been to see the Doctor. "No," he replied, laughing, "I don't care to be used as a sounding-board." "How is that," I asked. "Well," he replied, smiling, "when I go to see him he says he is awfully busy and then keeps me for half an hour talking about some old subject in which he happens to be interested, and which does *not* interest me." I laughed with him, and recognized how I also had been pleasantly hoaxed many times. When I would telephone to him asking for a few minutes for consultation, he would reply that he was terribly busy but could give me five minutes if I came right away. Upon my arrival at his office we would consume three minutes in settling the matter in hand and then I would find myself taking a minor part in a conversation that would last for half an hour before I would remind myself of my duties elsewhere. He was simply thinking out loud on the subject that happened to be in his mind and on which he had been writing when I had arrived. He had used me as "a sounding-board," as the Colonel said. That simply meant that he would be so full of his subject as to bubble over with it, if interrupted in his work by a

⁴The council of the Institution has changed its mind since then. In April 1919 it "decided to add an advertisement section to the Bulletin" in order to increase its revenue. This departure was "undertaken with reluctance" but was considered to be "justified by the altered conditions brought about by the War."

⁵Who is distantly related to the Doctor's family. At the time of the Revolution their ancestors were cousins; but Robert Raymond's ancestor remained loyal to King George and moved into Canada, while the Doctor's ancestor supported George Washington. So Professor Raymond was born a Canadian and became an American by self-determination.

^{*}Soon after the date of this incident, in 1904, he retired with the rank of Brigadier-General. As chairman of the Board of Engineers created by the Pennsylvania Railroad Company, he supervised the design and construction of the tunnels under the Hudson, the East River, and the borough of Manhattan, as well as the great Pennsylvania Terminal in New York.

call. This is an excellent scheme for preventing waste of time when a visitor arrives; in most instances the visitor fails to detect the expedient and goes away under the impression that *he* has had a good talk! As I write it, I can imagine the Doctor giving his little chuckle.

May I revert to my recollections of Dr. Raymond as editor of the Transactions of the Institute? What he did for me he did for others, therefore I venture to record my own experience in the matter. The effect of his teaching, as conveyed by the editing of manuscript and the explanations accompanying such revision, was far-reaching. The mining profession stood much in need of such teaching and the engineers that benefited from it will ever hold the Secretary in grateful remembrance. He not only revised our writings with painstaking care but he did something even more helpful: he would write long letters, in his easy flowing hand, six to ten pages, explaining why he had made certain corrections. He would give the benefit of his own wide knowledge and suggest additions or amendments of a character often vital to the value of the paper. My correspondence with him—voluminous and much valued—was destroyed in the San Francisco earthquake-fire, so I am unable to quote details illustrating his method, but I do remember his reference to “the inveterate fluent profuseness” of my style, whereupon I gave him the *tu quoque* with a smile. The only time that we disagreed over his treatment of my manuscript was when he returned one of my contributions—the paper entitled ‘The Cripple Creek Volcano’—without correction. The galley-proofs and the original manuscript arrived together; I was quick to notice that the latter was entirely free from marks of revision. The editor had failed to edit. I wrote a respectful letter protesting that I expected the benefit of his criticism. He wrote back something complimentary about my not needing such assistance, whereupon I told him that my chief reason for sending my writings to the Institute was to obtain the help and protection of his editing, and that if I did not receive it I would divert my contributions to technical magazines, which would pay me for them. I returned the manuscript and the galleys, making my point, thanks to his friendly concurrence.

He was a most effective speaker, because he always had something to say and he knew how to say it. His memory was extraordinary. In 1904 when the Iron and Steel Institute of Great Britain held its annual meeting in New York, he was asked to be one of the speakers at a banquet at the Waldorf-Astoria hotel. The banquet was on a Wednesday; on the previous Monday he sent me, as editor of the ‘Journal’, the text of his speech, which he had written on the Saturday previous. I sent it to the composing-room and had the proof of it in my pocket when present at the banquet. If he had been unable to deliver it, everybody would have known that it was written out beforehand, because it went to the printer, as part of that week’s issue (October 27, 1904) of the ‘Journal’, a day before it was to be delivered. While he was speaking I compared his phrasing with the proof in

my hand. It was verbatim, even to interjections that seemed to be born of the impulse of the moment. For instance, he referred to King Edward, and, apparently on the spur of the moment, he interjected, “and may God bless him, as God blessed his sainted mother,” a sentiment that elicited instant applause. Another similar interpolation referred to producers and consumers; he exclaimed, “Whom God hath joined together, let no man put asunder.” The speech was most successful, of course; but he made a mistake, and it is one made by many less clever men. When the speech as written had been spoken, he made a fresh start, adding the equivalent of twenty or thirty lines. The chairman, Mr. Andrew Carnegie, rather discourteously, I thought, interrupted him, so that the effect of the speech was marred. Coming out of the dining-room the Doctor said to me, “How close was it to the text?” I replied, “Perfectly.” He continued, “But I ought to have stopped.” “Yes,” said I. In preparing the memorial address, I had written that his extempore speeches could not be distinguished from those that he had “memorized.” His daughter, Mrs. Bellinger, to whom I read my address before delivery, suggested that “memorized” should be replaced by “written”, because when he wrote a speech he did not have to memorize it consciously: the act of writing it served to memorize it. This retentive memory was a great help to him in public speaking.

At our Institute meetings he was usually called upon to make the speech in which the visitors thanked the residents for their hospitality. This happened so often that once he demurred. It was at Aspen. Several of us in turn had been requested by the chairman of the committee on arrangements to express the thanks proper to the occasion; each in turn suggested that the Doctor ought to do it, because we knew he could do it best. When he rose to respond, he began with an apology for an apparent disinclination to perform the gracious task. He was asked to speak so often, he said, that he was reminded of the Civil War veteran who had told his little boy so much about his own performances in the War that the boy exclaimed: “Pop, couldn’t you get anybody to help you put down that rebellion?” When he made a witty or humorous point, he would smile and give a little chuckle, joining in the merriment. Another story. The Doctor was called “vindictive” sometimes, by those whom he engaged successfully in controversy. He was a skilful dialectician, and unhappy was the man whom he countered in controversy. Somebody asked Clarence King if Raymond was not vindictive. King demurred, suggesting that he was only belligerent. To illustrate the distinction he told the following story.

“Not long ago I was going up the trail from Silverton to the Silver Lake mine and I met a long train of mules carrying sacks of concentrate. Each mule had his tail tied to the halter of the one behind him, so that he was prevented from bringing his heels into action—all except the last; as I came abreast of him on the narrow trail and prepared to pass, I thought I saw a wicked look in his eye, so I said to the packer or mule-skinner, ‘Is that

⁶In Vol. XXX, page 367, of the Transactions.

mule vicious?' 'No,' he replied, 'he ain't exactly vicious but he's kind o' versatile with his hind hoofs.' The Doctor was versatile—with his pen—undoubtedly, but he was a kindly man, a generous man, and if he used his pen so that it touched more than paper it was in the joyousness of combat and the exuberance of mind—not to hurt, but to make good his argument.

He had the ability to digest a mass of information quickly and to present it in attractive form. He could master a new subject with wonderful facility. This enabled him to give public lectures on a great variety of topics. For instance, George W. Maynard told me how one day he asked Raymond to dine with him on the following Thursday. "Thursday?" he replied, "No, I can't do it; I have to lecture on 'Storms' at the Cooper Union next Thursday." Maynard said, laughing, "What do you know about storms?" "Nothing, but I'll know all about them by Thursday." He did; he went to Washington, discussed the subject with the experts of the Weather Bureau, and returned in time to deliver a lecture that proved to his audience that he knew all about storms that was worth knowing. He accumulated knowledge as a kitten laps milk. He could correlate facts so that they became living knowledge. He was an educator.

Mining in Arizona in 1919

The value of the gold, silver, copper, lead, and zinc mined in Arizona in 1918 was \$202,134,880, the greater part of which was for copper. Arizona continued to be the largest producer of copper in the United States and will probably maintain its position in 1919, but with a greatly reduced output during the first six months, when curtailment of production followed the reduction in the prices of metal. The output of gold in Arizona in 1918 was 262,919 oz., valued at \$5,435,027, which represents a considerable increase over that of the previous year. The United Eastern and other gold mines in Mohave county, which contribute the largest part of the State's output of gold, continued to produce heavily during the first half of 1919, the grade of ores permitting mining under the prevailing high costs. The gold derived from copper ores, however, will undoubtedly be much less in 1919 than in 1918, for two of the large mines and smelters near Jerome were closed for three months. The copper ores of the Ray Consolidated, Miami, and Inspiration contain little or no gold, but the ores of the Copper Queen, Calumet & Arizona, United Verde, and United Verde Extension contain much gold. Most of the silver produced in Arizona is derived from copper ores and lead ores. The total output of silver in 1918 was 6,686,152 oz., valued at \$1 per ounce. Mines in Yavapai and Cochise county produced the greater part of it. In 1919 there will probably be a decrease in output corresponding to the reduction in the output of copper. With the increase in the price of silver, some of the old silver mines in Yavapai county will become producers, and the new mill that treats the silver ores of the Hackberry

property, in Mohave county, will probably add to the output of silver in 1919.

The production of copper in Arizona was 764,885,874 lb. in 1918, against 712,166,891 lb. in 1917. The market for copper in the first part of 1919 was decidedly poor, and the price decreased from an average of 24.70c. per pound in 1918 to about 15c. in March 1919. Much copper in ingots was piled in nearly all the smelter yards awaiting shipment, and only the greatly reduced current production was sent to the Eastern refiners. Several of the smelting plants were closed, the Shannon in January and the Saseo, United Verde, and United Verde Extension in February, though the last two resumed operations in May and June. The mines were producing at the rate of about 60% of their output in 1918. The monthly production of the Inspiration and Miami companies was close to that of the previous year, but the Ray Consolidated was making about half its former output. There was a general scarcity of miners and mechanics, and even the return of the troops failed to meet the demand; but the curtailment has permitted mine development and repair and reconstruction of furnaces after a period of forced production. One of the interesting features of the work of the first six months of the year was the continuation of stripping by steam-shovel on Sacramento Hill, at Bisbee. The United Verde began work with steam-shovels to uncover a large body of low-grade ore and kept a force of men making extensive improvements and additions to the capacity of the new smelting plant at Clarkdale. At Ajo the New Cornelia Copper Co. plans to construct a 500-ton experimental flotation plant for its sulphide ore, and at Ray the new mill of the Ray Hercules company was treating about 800 tons of low-grade copper ore per day.

The output of lead in 1918 was 12,503,689 lb., a decrease from 25,465,445 lb. in 1917. As the price was only about 5c. per lb. in April 1919, and there was no great demand for the metal, there will probably be a further decrease in 1919. This statement also applies to the output of zinc, which fell from 20,894,860 lb. of recoverable metal in 1917 to 2,269,643 lb. in 1918. The Arizona Hillside property, in Yavapai county, continues its shipments of rich zinc sulphide ore. Good zinc ore was said to have been mined by the Schuylkill company through the Tennessee mine, formerly a large producer of both lead and zinc.

The dividends of Arizona mining companies were reduced considerably in 1919. The largest contributors were the Phelps Dodge, Inspiration, United Eastern, Ray Consolidated, Arizona Copper, Iron Cap, Miami, and United Verde.—V. C. Heikes, U. S. Geological Survey.

DURING THE WAR the Japanese zinc industry was very prosperous, and large profits were made on ore imported from Australia and the French Indies. The signing of the Armistice dealt the industry a heavy blow, as it costs \$200 per ton to produce zinc in Japan. It is expected this will result in a request for subsidies.

Technical Operations on the Suan Concession, Korea—I

By A. R. WEIGALL and J. F. MITCHELL-ROBERTS

HISTORY. The Suan Concession is situated at about Lat. 38°48' N. and Long. 120°20' E., in Whang Hai province, central Korea, and 55 miles east of the city of Pyeng Yang. The elevation of the main adit at the Suan mine is 1150 ft. and the Tul Mi Chung adit is 900 ft. above sea-level.

The Concession as originally granted was a rectangular area of 15½ miles by 10½ miles. It covered, therefore, about 160 square miles. This area was reduced to 59,000 acres in December 1916 by eliminating such portions as appeared to have no mineral value. It was formally granted on November 4, 1905, to Arthur L. Pearse, who assigned his rights to the Korean Syndicate of London. In the early part of that year, when the Concession was granted in principle, although the actual grant was not signed, a triangular combination was formed to operate the property. This consisted of the Korean Syndicate, a British combination, Collbran & Bostwick,* an American firm with headquarters at Seoul, Korea, and a Japanese group represented by Mitsui & Company of Tokyo, Japan. This was the celebrated Anglo-American-Japanese combination which was the subject of much Japanese and Far-Eastern newspaper comment at that time, enthusiastically foreshadowing a new era of international co-operation for the development of Korea.

The main terms of the Concession, as finally ratified, were that the concessionaire had exclusive mineral rights within the area. The duration of the Concession was for a period of 35 years, at the expiry of which period the concessionaire has the right to renew the Concession. The taxation under the Concession was fixed at an annual tsubo (0.8166 acre, say, 30½ cents per acre) for all land selected for mining purposes, and in addition a royalty was to be paid amounting to 1% of the annual output of the mines.

When the property was examined, in April 1905, by engineers representing the three groups, the Japanese representatives considered that the Concession presented no mining promise, so the Japanese group withdrew, leaving the property jointly owned by the English and American groups. The Concession was then jointly operated by the Korean Syndicate and the firm of Collbran & Bostwick, the actual work being undertaken and supervised by the engineers of the Syndicate. After nearly two years of rather disappointing results, the Korean Syndicate abandoned further work on the Concession, the active operation of which was taken over in 1907 by Messrs. Collbran and Bostwick, the Syndicate leasing its half-interest for a royalty based on a percentage of the net profit obtained.

After the developments undertaken by Messrs. Collbran and Bostwick had proved the existence of profitable orebodies, the Seoul Mining Company was incorporated on April 27, 1908, to take over all right, title, and interest possessed by Messrs. Collbran and Bostwick, the property being then transferred to the Seoul Mining Company, which has continuously and successfully operated it since that date.

By the end of 1908 the development of the original Suan mine, at Holkol village, had progressed to a stage where a milling-plant was warranted and in the spring of 1909 a 20-stamp mill was purchased together with accessory plant, the design of which was based on ore-tests carried out by Abbott A. Hanks of San Francisco. Ground was broken for this mill on April 2, 1909, and on November 20 the first stamp was dropped. During 1910 another 20 stamps and accessory plant were purchased, the capacity of the mill being doubled. This addition was completed by December 1, 1910.

Active prospecting was started at once on other parts of the Concession, resulting in the discovery of the Tul Mi Chung mine. In the winter of 1911-1912 further prospecting led to the discovery of large orebodies, so that by the spring of 1913 the building of a plant for Tul Mi Chung was taken in hand. Ore-tests were carried out both at the mine and in England, on the results of which the present mill was designed in 1914 and shipped to Korea at the end of that year. Work was commenced on this mill in April 1915 and it commenced operations at the beginning of October.

Other mines and prospects have been discovered and are in course of development, though none of them have yet been equipped with a milling-plant. The most important is probably the Tong Ahm mine, which has lately become a regular producer, the ore being trammed to the Tul Mi Chung plant for treatment.

The Seoul Mining Co. was originally capitalized at \$400,000, now increased to \$563,625. An initial dividend of 25% was paid on the operations for 1910, the year in which milling operations were commenced. Since that date dividends at the rate of 50% per annum have been maintained, the total amount paid to the end of 1918 being \$1,995,925.

GEOLOGY. The ore deposits of the Suan Concession are of the contact-metamorphic type, occurring in limestone around the edges of a granitic batholith, elliptical in shape and roughly six miles by five miles in its main dimensions. The periphery of this contact, which has been named the Collbran Contact, is about 23 miles long. The intrusion of the granite has uplifted and shattered the surrounding sedimentary rocks, producing intense contact metamorphism. Around the edges of the Coll-

*Henry Collbran and Harry Rice Bostwick.

bran Contact orebodies occur irregularly in the altered limestone. These orebodies conform to the recognized type and show all the irregularities generally associated with contact-metamorphic deposits. In places the development of the typical contact-minerals has been very marked, and the whole occurrence forms a remarkably characteristic example of contact-metamorphism of the greatest scientific and economic interest.

In conjunction with the active prospecting and development carried out by the Seoul Mining Co., the services of D. F. Higgins were engaged for the purpose of mapping the Contact and of making a geological examination of the ore deposits of the Concession. On the completion of this work in 1913, Mr. Higgins made a report covering the economic geology, accompanied by a plan of the Contact. Subsequently he published a brief summary of his work in the January 1918 issue of 'Economic Geology', in a paper entitled 'Geology and Ore Deposits of the Collbran Contact of the Suan Mining Concession, Korea'.

In 1915, J. Malcolm Maclaren was engaged to make a geological examination of the Concession and, after spending several months on the property, made a report of great scientific and practical value on the economic geology.

The ore deposits occur near the granite in the limestone surrounding the granite intrusion. The limestone has been altered to marble and other metamorphic aggregates. The ore occurs in the altered limestone and its occurrence is invariably associated with faults that have served as passages for the hot mineralizing solutions, which on cooling have deposited the ore in its present position.

"The sedimentary rocks of the Collbran Contact are not mineralized over the whole length (23 miles) of the Contact. Schist in contact with grano-diorite carries no ore, and even in the contact limestone there are long stretches devoid of ore deposits. It appears that ore deposition is *not* dependent on mere contact of grano-diorite and limestone, but requires also that the contact region be crossed by faults connected with the cooling grano-diorite mass, the faults serving as channels of egress for hot ore-bearing solutions, that deposited their metal content on reaching the surrounding cold limestone."¹

The orebodies exhibit irregularity as regards their distance from the Contact. In the Suan mine they have invariably been found adjacent to the Contact and with their longer dimension roughly parallel to it. In the Tul Mi Chung mine, although some orebodies occur within a few feet of the limestone-granite contact and even at the actual Contact, the more important ones are found at a considerable distance from it; as much as 1500 ft. In this case, however, the ore is in proximity to a tongue of fine-grained granitic rock that has been extruded from the main granite mass as a later phase of the intrusion. The outcrop of the orebodies of the Tong Ahm mine is some 1500 ft. from the Contact, but these deposits, which occur at the junction of the limestone with the overlying

schist, dip at a flat angle and are rapidly approaching the granite as they are followed down. The Peh Jai orebody is some 5000 ft. away, and the Soctarie deposit occurs at a similar distance from the Contact. In general, it may be said that ore has not been found at a distance of more than one mile from the nearest point of the outcrop of the granite, and it is quite possible that the unexposed edges of the batholith in depth may be closer than the horizontal distance on the surface.

The sequence of ore deposition was as follows:

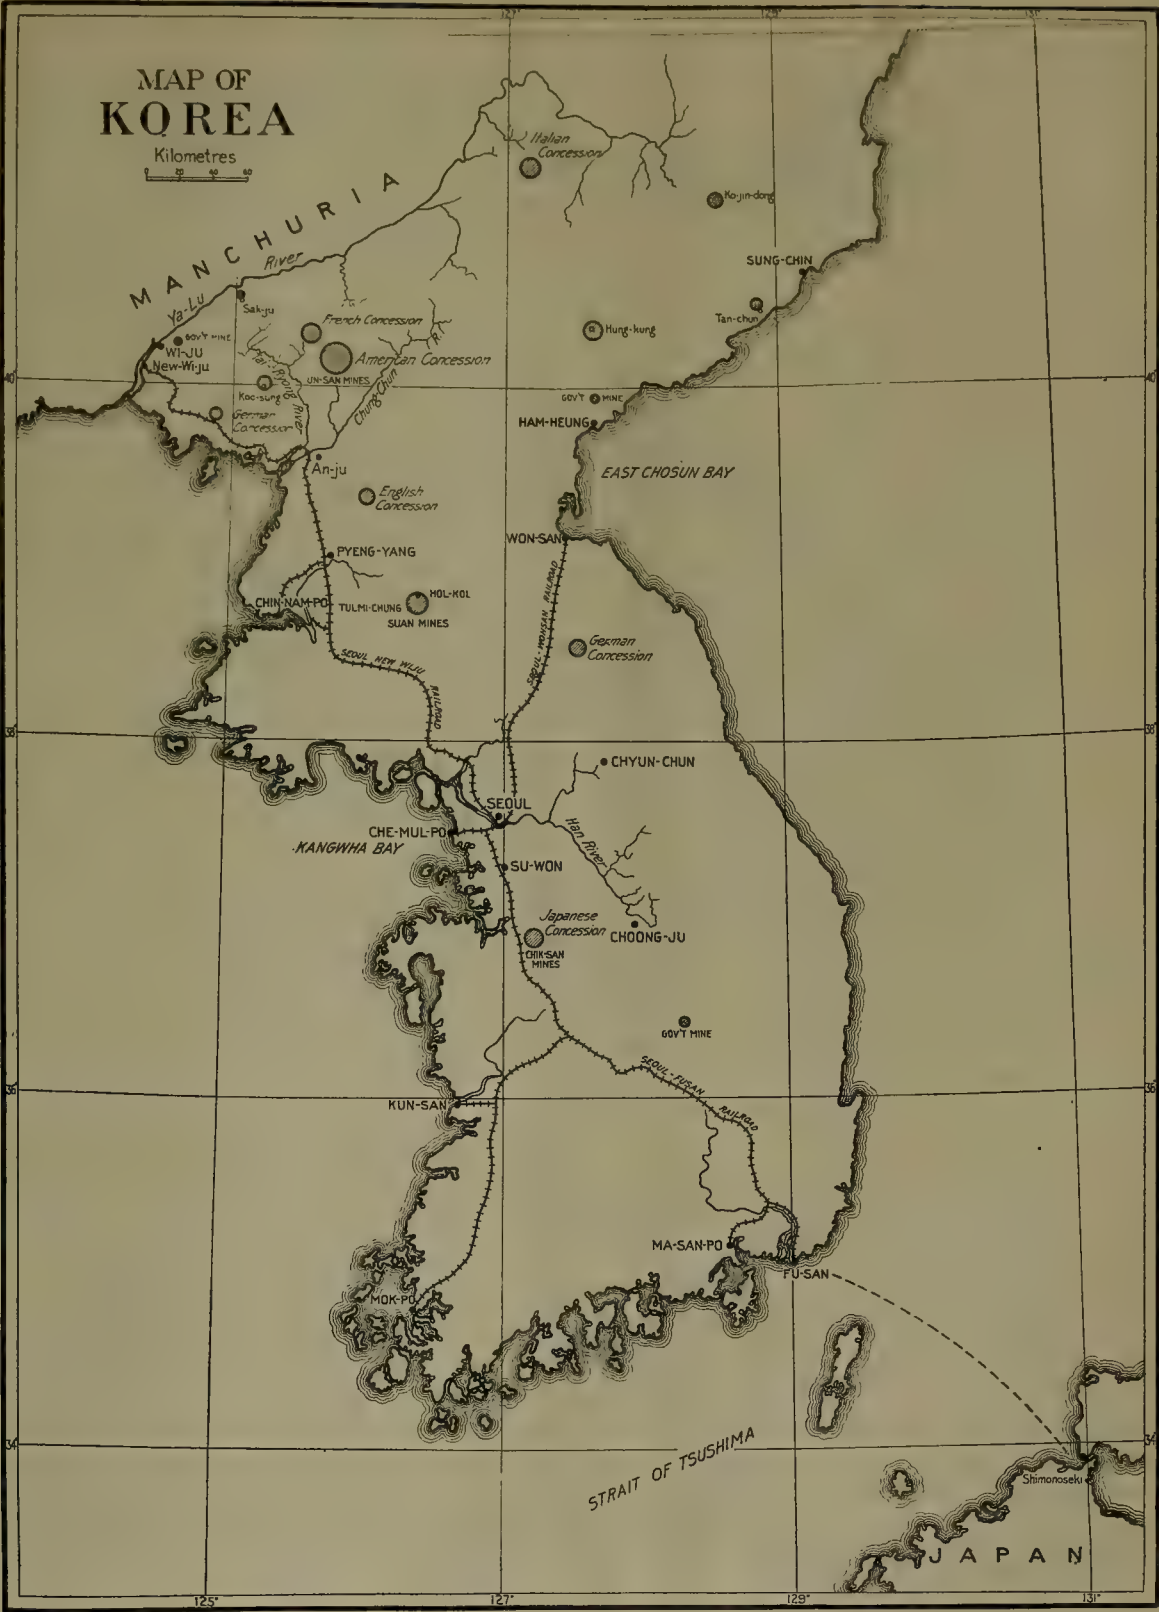

"It has already been pointed out that ore deposition has taken place as an end-action following the intrusion of the grano-diorite batholith, the sequence being: (a) intrusion of the main batholith through middle Paleozoic limestone and schist; (b) segregation within the main mass and subsequent extrusion of fine-grained granite, quartz-monzonite, quartz-diorite; (c) faulting of the region on a large scale; (d) emission of metalliferous solutions from the central grano-dioritic mass along fault-planes that connected the still heated interior of the batholith with the surface; (e) cooling of metalliferous solutions in the surrounding sedimentary rocks, with replacement of and deposition in limestone (1) of copper, gold, bismuth, molybdenite near the Contact and (2) zinc and lead farther away."²

The valuable metals in the ore are mainly gold and copper; bismuth, silver, and tungsten also occur as metals of economic importance. The amount of gold present is probably unusual in a deposit of this type. Galena and zinc-blende are present, also molybdenite, but so far no profitable deposit of these minerals has been discovered. As a general rule the gold-copper ores occur closer to the Contact and the lead-zinc deposits farther away, indicating that ore deposition was associated with the cooling of the solutions given off from the granitic magma. A great diversity both of ore and of gangue-minerals exists; for instance, on one part of the Concession a considerable amount of prospecting was done on an orebody that owed its value to the presence of a gold-bismuth telluride. Arsenic is present, both as mispickel and lollingite (Fe_2As_3). These arsenical minerals only occur in small quantity, averaging 0.25% arsenic in the ore of the Tul Mi Chung mine, but, as will be shown hereafter, they have a most important bearing on the metallurgical treatment of this ore, where a portion of the gold is closely associated with abnormally finely-divided lollingite, possibly as an arsenical-gold mineral. Scheelite occurs sparingly in most of the orebodies, also bismuth sulphide, and in places economically valuable deposits of tungsten and bismuth are being mined.

The gangue contains practically all the typical contact-metamorphic minerals. The presence of much garnet, almost invariably associated with the ore, and to a less extent magnetite, is important as affecting gravity concentration. Space will not permit of a more detailed description of the contact-gangue minerals, although these are of great geologic interest.

¹Dr. Maclaren's report.

²Ibid.

Secondary enrichment has not supervened, or, at most, to only an insignificant degree. The orebodies that are mined consist of the unaltered primary sulphides, and no falling off in grade with depth has been noticed. This point was clearly apparent when in 1913 a survey was made of the ore-reserve in the Suan mine. To supplement the mine sampling, some 2000 check-samples were taken by me at a time when the mine was opened up on practically every level, not only by drifts but also by stopes. Leaving out the surface impoverishment, extending to a depth of from 50 to 100 ft. from the surface, the average grade of the ore at the different levels was maintained down to the bottom of the mine, and on the lowest hundred feet above the point where the ore cut out the general grade was above the average grade of the whole mine.

As regards secondary enrichment and referring particularly to the Suan mine, Dr. Maclaren expressed the following view:

"As a result of my examination I have come to the conclusion that secondary (sulphide) enrichment has played no part whatever in the formation of these Holkol orebodies and that they represent primary sulphide deposits, the upper portions of which have been eroded away. The principal arguments for the above conclusions, none of which taken singly are conclusive, are:

"(1) The absence of any lean copper zone on No. 4 level. The eastern orebodies below No. 3 level cut out entirely and do not continue downward as poor ore, though the 'formation' or lode-channel continues. Further, there are small sporadic ore occurrences on and above No. 4 of only slightly lower grade than the ore of the main orebodies. There is apparently therefore no uniform impoverishment in depth. Accurate data on this head are, however, difficult to obtain owing to the impossibility of obtaining true samples of the ore.

"(2) Large bodies of pure iron pyrite exist in the upper levels that show no sign of replacement by chalcocite or chalcopyrite.

"(3) Absence of copper glance (chalcocite) in the eastern orebodies. A little copper glance was found in the western orebody.

"(4) The orebodies do not end downward along a definite horizon but as downward-stretching fingers or tongues. Their lower limit therefore does not indicate a 'pinch' or narrow place in the lode-channel.

"(5) No. 4 level shows a diminution in the quantity of iron pyrite in the lode-channel commensurate with the decrease of chalcopyrite, thus indicating a general cessation of metalliferous deposition in depth. With this there is also a general softening of the country downward, indicating less impregnation with silica; while at the date of this report only one patch of iron sulphide containing a little copper had been met with on No. 5 level."

With regard to the depth at which the ore deposits were formed, Mr. Higgins expresses the view that the depth "was probably about 20,000 ft., at a pressure of about 1500 atmospheres to the square inch; but this esti-

mate may be subject to great revision." The only conclusive evidence regarding the depth below the surface to which the orebodies extend is afforded by the operation of the Suan mine, which has been bottomed at a depth of about 650 ft. below the outcrop, and is now practically stoped out. The ore did not cut off sharply in the bottom of the mine but died out in wedge-shaped points, below which only a few scattered patches of ore were found in the 'formation', which still persisted. There is no further evidence available as regards the depths to which ore extends, as the other mines on the Concession have not been bottomed. The deepest working on ore in the Tul Mi Chung is about 550 ft. below the outcrop.

In size the orebodies exhibit great irregularity both as to width and length. Generally they are roughly lenticular in form. The largest stope in the Tul Mi Chung is 400 ft. long with an average width of 30 ft., and every kind of variation in size and shape exists in the different stopes. In some cases pipe-like bodies, almost circular in plan, have been mined. The widest stope in the Suan mine was 96 ft. wide by 110 ft. long. The longest stope was about 300 ft. long by 50 ft. wide.

The following brief account of the ore deposits of the different mines and prospects on the Concession will illustrate the general types:

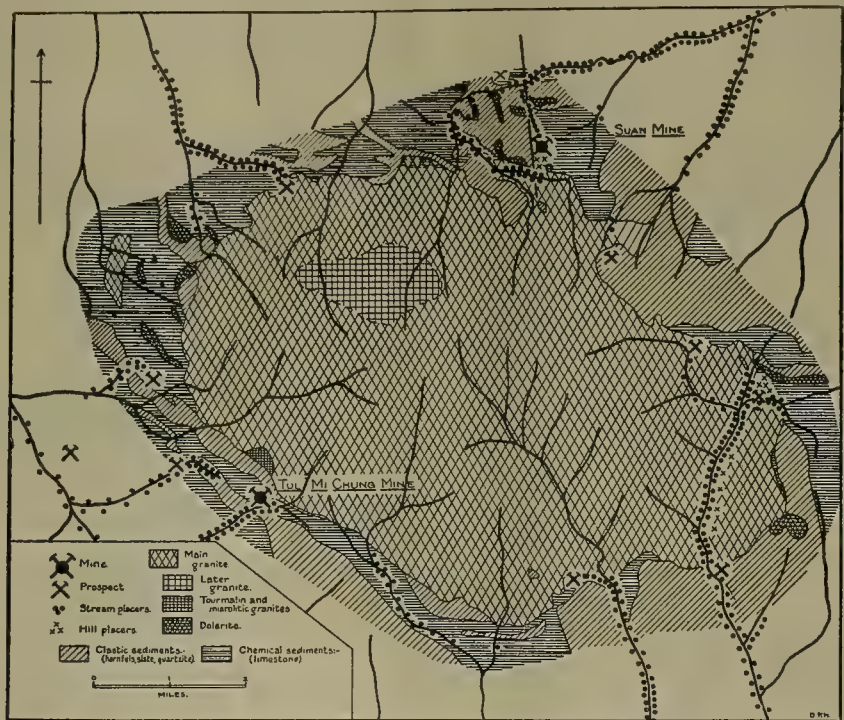

"The orebodies of the Suan mine are readily divisible into two groups, a western and an eastern. The former are formed along the fault-planes and apparently in their hanging walls, the latter along older fissures parallel to the granite contact, but are nevertheless limited west and east by two members of the eastward-dipping fault series."³

The eastern orebodies have produced the bulk of the ore that has come from the Suan mine. The smaller but richer western orebodies are roughly tabular or lenticular in form and occur on the great fault-zone that extends along the western side of the Holkol valley. "The orebodies of the eastern group are far more irregular, and occur in a series of interlocking fault-zones, which make up one large zone about parallel to the Contact and approximately at right angles to the west fault."⁴

The eastern orebodies are separated from the granite by a layer of garnet-rock of varying width, but averaging 10 to 20 ft.; this lies immediately on the Contact. Between the garnet and the ore there is usually a band of a hard hornfels-rock, locally called 'schist', of about the same thickness as the garnet band. Next occurs the 'formation' in which the orebodies were formed. This varies in size from a narrow stringer up to a maximum thickness of 125 ft. The outer wall of the formation is composed of a dark limestone, which merges into the ordinary altered limestone of the contact-zone. Dr. Maclaren says: "While the garnet-rock and the 'schist' are developed from the limestone directly by the heat and steam of the adjacent Suan granite, hot waters and the material they contained altered and replaced the limestone along the fissure-walls and deposited nests of

³Maclaren's report.

THE SUAN GRANITE AND THE COLLBRAN CONTACT

After D. F. Higgins

mica, diopside, and other minerals (but no metallic sulphides), thus giving the 'formation', 'ledge-matter', or lode-channels which have always been followed at Holkol in search of ore in the eastern part of the mine. This alteration of the limestone to 'formation' is to be regarded as the final phase of the local effect of the steam of the adjacent grano-diorite, for the process of impregnation with ore belongs to a much later date, and while it doubtless owes its origin to emanations from the grano-diorite, it cannot, as can the above minerals, be directly connected with the rock. In other words, while the garnet, diopside, mica, ilvaite, tremolite, magnetite, actinolite, and other useless minerals in the 'formation' have clearly been derived directly from the immediately adjacent and underlying grano-diorite (for their formation is identical with that of the minerals on the walls of the main mass), all the evidence available shows that the metallic sulphides, gold, and silica that yield 'ledge-matter' (faintly impregnated limestone) came from a deep-seated source long subsequent to the formation of the above minerals. If it were not so, and the gold, copper, iron, zinc, lead, and bismuth were directly derived from the adjacent grano-diorite, then we would expect every foot of limestone in contact with that rock along the 23 miles of the Collbran Contact to be impregnated with metallic sulphides, but we know positively that such is not the case and that ore deposits are localized along the Contact.

"What is then the cause of this localization? In the case of the Holkol deposit and for most others known on the Concession the answer is clear. The 'formation', and, in the case of the western orebodies, the limestone have been impregnated with ore from a series of parallel fault-planes striking NNW-SSE and dipping eastward at 55°. These faults form therefore the most important physical feature at Holkol. The fault-zone that has produced orebodies is about 750 ft. wide. In this width are four principal parallel fault-planes together with several of lesser importance in regard to orebodies. This fault-zone is well marked on the surface. It has been entirely responsible for the Holkol valley, the western side of which is practically coincident with the foot-wall fault-plane. Beyond Soctarie it continues northward, the galena-silver outcrop at Eun So Kol that has been worked north of Soctarie apparently lying in it.

"A consideration of the general character of the gangue of the 'formation' parallel to the granite contact and of the fault-fissures at right angles to the same shows that they were not formed or filled at the same time. The former has the contact-minerals, mica, diopside, magnetite, etc., in abundance, and therefore represents fissures that were open when these contact-minerals were circulating in solution. These minerals are, however, absent from the members of the fault-zones which have in the main only crushed fault-rock. Both 'formation' and fault-planes were, however, impregnated by the later metallic sulphides. The order of origin and deposition is therefore: (1) formation of

fissures parallel to grano-diorite contact; (2) impregnation of same with mica, diopside, etc.; (3) formation of fault-fissures; (4) impregnation of both sets of fissures with metallic sulphides."

In the Tul Mi Chung deposit, which is at present the main producing mine on the Concession, the ore-occurrence differs somewhat from the foregoing, the bulk of the orebodies being either formed close alongside a tongue of quartz-diorite which has been extruded as a later phase of the intrusion from the main granitic mass into the limestone and schist, at about right angles to the general direction of the Contact, or they are found at the flatly dipping boundary of limestone with overlying schist. This tongue of quartz-diorite divides the Tul Mi Chung mine into two portions, known respectively as the North mine and the South mine. The width of this intrusion varies from 500 to 800 ft., and its original irregularity in shape has been greatly increased by subsequent extensive faulting. It may be described roughly as a quartz-diorite in composition; it is of a much finer-grained texture than the granite of the main mass and does not exhibit the large porphyritic crystals of orthoclase that are typical of the batholith itself. The faults that governed the deposition of ore in the limestone more or less followed the general course of the quartz-diorite intrusion. As Dr. Maclaren says: "The importance of the quartz-diorite lies in the fact that the orebodies, on the whole, lie near its walls and also in the probability that ore was deposited in the limestone by metalliferous solutions that followed in the track of the quartz-diorite intrusion."

The changes in the limestone effected by the quartz-diorite intrusion are stated by Dr. Maclaren as follows:

"The limestone has been affected by the quartz-diorite intrusion for a short distance, rarely more than 100 ft., from its contact with that rock. Small irregular areas have been re-crystallized ('marmorized' or 'marbleized') by the heat of the intrusive rock, but the major part of the change in the altered zone has been brought about by solutions that followed the course of the quartz-diorite. These high-temperature solutions have formed (a) an irregular zone from 30 to 50 ft. wide of 'contact-rock' which is immediately next to the quartz-diorite and which is characterized by clear bluish calcite (up to two inches thick) embedded in a dull dirty-white matrix of feldspar and wollastonite. Large crystals of dark mica are often associated with the calcite. The order of deposition appears to have been feldspar and wollastonite, and then calcite and mica. This zone is not everywhere continuous along the Contact. It is best shown on the southern contact. On the northern contact its place is sometimes taken (as at No. 4 orebody) by a very fine-grained rock, containing diopside, garnet, calcite, and serpentine. Beyond the 'contact-rock' and farther away from the quartz-diorite is the ore-zone in which limestone has been largely replaced by garnet, diopside, serpentine, calcite, epidote, zoisite, actinolite, pale-green mica, magnetite, and specularite. There is a characteristic absence of silicification. In this respect Tul Mi Chung

differs entirely from Suan. The foregoing are the gangue-minerals, and amid them, apparently as the final deposit of the hot solutions, were deposited gold, pyrite, chalcopyrite, mispickel, galena, and molybdenite. The two last occur together and generally at some distance from the copper minerals, giving the impression that they were the last of the metallic sulphides to separate from the ore-bearing solution. The locus of the gold has not been determined. No great amount of work has been spent on the determination of the more obscure minerals of the contact-zone. I have considered that with the comparatively limited time at my disposal it is a matter of much greater importance to outline the direction of the probable ore-channels and to attempt to arrive at some understanding of the features that govern the disposition of orebodies within those channels than to devote any time to the elucidation of points that, though of considerable scientific interest, have no obvious economic importance."

A type of orebody that has been extensively developed in the South mine at Tul Mi Chung during the last two years and also at the Tong Ahm mine, and one of increasing importance, is formed at the junction of limestone and schist dipping flatly at about 30° toward the granite. The schist overlies the limestone and has formed an impervious roof, causing the deposition of irregular bodies of ore, some of them of large size, the hanging wall of which is invariably formed by the overlying schist. With one exception, no ore has been found in the schist itself, although ore lies immediately against it. The one instance of ore having been found in the schist is at the northern end of the Tong Ahm mine, where a body of high-grade copper ore occurs in limestone and in association with an acid dike. Where the dike has intruded the schist, ore occurs in the schist itself. Dr. Maclaren says:

"The striking feature in connection with the occurrence of the orebodies already known is their occurrence beneath an overhanging roof, either of quartz-diorite, as in the case of the northern orebodies and 'B' of the southern orebodies, or of schist, as in the case of 'C' orebody. . . . It is further conceivable that the zone immediately beneath an impervious roof formed by the 'dig'* in a fault-plane would be a favorable locus for ore, though no such orebody is yet known at Tul Mi Chung."

Ore has been discovered recently in the Tul Mi Chung in the limestone at the main granite contact, formed either between the limestone and granite or more generally in the limestone close to the Contact, from which it is separated by a zone of contact-rock of an average width of about 50 feet.

The orebodies of the Tong Ahm mine almost invariably occur in the limestone underlying a roof of flatly dipping schist. In the Tong Ahm workings the influence of faults on the deposition of ore is very marked. The ore-bearing solutions appear to have flowed up through well-defined faults in the limestone, usually at right

angles to the limestone-schist contact, and deposited ore immediately under the schist.

The Soctarie orebodies consist of a flatly-dipping band of silicious limestone, which in places has been altered to a quartzite. The average thickness of this band is about 30 ft. It contains small amounts of gold, copper, silver, and tungsten, and although the grade is low, the size of the deposit permits it to be mined cheaply by quarrying and to be operated at a profit. The scheelite is finely divided and scattered through the ore, but in places we find bunches of an apple-green scheelite, which, from its color, was at first set down as cupro-scheelite. Scheelite also occurs as white crystals of a pearly lustre, not only at Soctarie, but also at Peh Jai, Kung Kol, Sang Dei, Tong Ahm, Tul Mi Chung, and in other mines and prospects around the Contact, although so far scheelite of an economic grade has only been found at Soctarie and Peh Jai.

Although the portion of the Soctarie band that consists of ore is some 5000 ft. away from the nearest point of the Contact on the surface, it appears to be connected with one of the main faults that run out from the granite and that have probably served as channels through which the ore-bearing solutions were brought to the present locus of the orebodies in the quartzite. The deposits in the various other mines and prospects surrounding the Contact consist of variations and combinations of the above-described types, all plainly formed as an after-result of the intrusion of the batholith into the limestone.

(To be Continued)

MISUNDERSTANDINGS between shift-bosses and the men under them are perennial. The following letter, written by an unhappy chuteman to the superintendent, was printed in the 'Granby News', which states that as good chutemen were scarce the man was transferred to another shift-boss with satisfactory results:

"Dear Sir:—I very often heard from the Granby's employees say: that no man get along with B. Blank. Last Saturday night I found what I thought was exaggerate is perfectly true. I been worked for many bosses in this country and I noticed always that they could obtain as much and probably more work from their men without use any rough Language. We chutemen the trouble we have as: big muck, timbers, rails, pipes in the chutes headache from the powder, car off the track 10,000 compinations to get hurt. All this trouble is not enough for the money we get but we got to listen the educationless shift boss's bad words "as side dish." For the second time B. Blank offended me last Saturday night without any reason, but just because I'm Italian and also he had the mouth to talk with not because he had any brains. I told the motorman to report me off yesterday I don't like give any more chance to get me in trouble. I soon lose money than my liberty. I thank you for your valuable time you spent to read my important communication and pardon me to not call at your office personally because I think I can explain myself better in writing and this will cause less disturb too."

*Gouge or clay.—Editor.

Palladium in Alaskan Lode Deposits

By DONALD G. CAMPBELL

INTRODUCTION. Early in 1918, it was discovered in the course of laboratory work that the copper ore of the Goodro mine in Alaska contained, in addition to traces of platinum, a considerable amount of the even rarer metal, palladium. The find was of special importance in that palladium was in such association with other metals as to concentrate from low-grade ore with a high ratio of concentration and percentage of extraction.

The Goodro property is now owned and operated by the Saltechuck Mining Co., and will be here referred to as the Saltechuck. It is situated near the head of Kasaan bay, Prince of Wales island, and lies about 45 miles in a north-westerly direction from Ketchikan, Alaska.

The discovery of the bornite outcrop led to the location and subsequent working of the lode on the basis of its copper, gold, and silver contents. The first shipment of ore is said to have been made in 1907. Since then it has probably shipped over 10,000 tons of ore to the copper smelters, being developed and worked intermittently until the past two or three years.

With change of ownership, a 50-ton concentration and flotation mill was built and placed in operation, together with a water-power plant. The mill is connected with the mine by a gravity plane about 3000 ft. long.

LOCAL GEOLOGY. The Saltechuck is situated among a group of copper mines that have operated steadily for the past ten or fifteen years. Of these, the best known are the Mamie, It, Mt. Andrew, and the Rush & Brown. These lie along Kasaan peninsula, a rocky promontory whose peaks rise to a maximum of 2800 ft. above sea-level. Toward its head the peninsula becomes less rugged and is connected with the island by a neck of relatively low altitude. Here occur a large intrusive mass of diorite and gabbro. In the latter, at an elevation of 400 ft., is the outcrop of the Saltechuck orebody, which forms a roughly cone-shaped knoll rising about 100 ft. above a well-defined bench. The latter apparently represents a former level of erosion.

The earliest development was by pits and open-cuts along the outcrop. Later a cross-cut was driven 90 ft. below the surface, and through this the ore is now handled from the glory-hole above. Still later a winze was sunk 100 ft. and drifts were driven from the bottom. These have opened up considerable ore additional to that shown at the surface. At the present time a 1200-ft. cross-cut is being driven from the mill-level to tap the orebody about a hundred feet below the lowest workings. Through it all the ore will be handled, doing away with the surface tramway now in use.

The geology of this district has been worked out by C. W. Wright in Professional Paper No. 87, U. S. Geological Survey. According to him the area is composed of

limestone, slates, schists, and other sedimentaries of Carboniferous age. These intrusives are stated to occupy about one-third of the area of this region.

Mr. Wright, in this paper, classifies the ores of the district as primary, showing little trace of weathering or of surface concentration, and belonging to the following types:

(1) Contact deposits forming irregular masses of chalcopyrite-magnetite ore along intrusive contacts. This is the most common form. The Mamie, Mt. Andrew, and the Haida, among others, belong to this class.

(2) Disseminated deposits forming irregular masses in gabbro intrusives, and consisting of bornite-chalcopyrite ores intimately associated with the primary minerals of the intrusive rock. Secondary epidote and calcite are usually strongly developed. The Saltechuck is the only producing property of this type in the district.

(3) Shear-zone deposits occupying fissures along shearing-planes in the graywackes. The ores are galena-sphalerite mixtures in a gangue of quartz, calcite, and barite. The Rush & Brown deposit occurs mainly in this form.

(4) Vein deposits occupying fissures in the limestone and also in the granitic intrusives. This type has been prospected but as yet has yielded no ore.

THE ORE occurs mainly as bornite, varying from small masses to minute particles, disseminated in the greatly shattered and altered rock which forms the gangue. This rock has always been classified as gabbro, but is more particularly 'pyroxenite' and will be so referred to in this article. Mixed more or less with the bornite is chalcocite, some covellite, and occasional stringers of chalcopyrite.

The formation here is greatly brecciated and fractured, the fractures running in every direction. Slip-planes are to be seen, but no sign of extensive faulting is shown. A small diabase dike cuts the orebody without apparent effect on the latter. Many of the fracture-planes are filled with epidote, mica, and calcite, and some contain flakes of free gold. In others, the ore is to be found. Where the rock is greatly shattered, the ore may be continuous between fissures. Where the rock is more massive, the ore gradually fades to barren pyroxenite. The grade and continuity of the ore depends upon the number and strength of the fractures.

PLATINUM AND PALLADIUM. So far, no separate mineralization of these metals has been discovered. The platinum content is small, but fairly regular. The palladium varies approximately with the copper content in the proportion of one ounce of palladium per ton for every 8% or 12% of copper. The seams of chalcopyrite also carry

considerable amounts of it and the 'barren' gabbro is not free from mineralization. Some typical gabbros are given herewith:

| Description | Gold, oz. | Silver, oz. | Pt and Pd, oz. | Copper, % |
|-----------------------|--------------|----------------|-------------------|--------------|
| Glory-hole | 0.07 | 0.17 | 0.41 | 1.92 |
| 150-ft. level | 0.07 | 0.24 | 0.184 | 1.08 |
| Bottom of winze | 0.05 | 0.24 | 0.17 | 1.28 |
| Chalcopyrite | 0.11 | 2.08 | 1.01 | 27.66 |
| Concentrate | 1.17 | 4.60 | 3.54 | 43.81 |
| Gabbro | 0.01 | 0.10 | 0.01 | 0.06 |

EXTENT OF THE OREBODIES. While the ore thus far mined has come from within an area probably less than 70 ft. wide by 150 ft. long, sufficient evidence is at hand to indicate the probability of connected deposits of ore along the strike of the principal fracture-planes. The form of the outcrop indicates that the orebodies are more resistant to erosion than the non-mineralized country-rock. The knoll forming the outcrop is an isolated por-

USES OF PLATINUM AND PALLADIUM. Palladium has come into economic prominence only within the past few

OUTCROP AND GLORY-HOLE AT SALTCHUCK

tion of a well-defined ridge extending eastward, but is less pronounced for some distance west. At several places, in both directions from the orebody, mineral has been discovered, identical in nature and equal in grade to that now being mined. The surface is covered with so much soil and vegetation that systematic prospecting has been restricted.

PROSPECTS ELSEWHERE. While this is the only recorded deposit of bornite in association with gabbro or pyroxenite in south-eastern Alaska, it is far from uncommon through British Columbia and other parts of Alaska. Further prospecting and careful analysis may show other deposits of similar nature.

In this connection it must be remembered that the chalcopyrite, as well as the bornite, carries the palladium. It is probable that the criterion, in looking for further finds, should not be the bornite alone, nor even the copper minerals, but the presence of any economic minerals in a pyroxenite or gabbro gangue. The strong tendency of this group of metals to occur in basic rock of this nature is shown in the following tabulation of some of the best-known occurrences throughout the world.

years, and now commands an even higher price than platinum owing to the discovery that its alloys with gold and silver satisfactorily replace the latter metal for many purposes. For most laboratory utensils, in jewelry, and for dental and other industrial uses, these alloys are found to possess all the needed chemical and physical qualities for which platinum has been hitherto indispensable. Such alloys have the same silvery color, and a lower specific gravity. For equal strength they require only half the weight of platinum, are even harder, and work satisfactorily.

CONSUMPTION. Normally, the United States used 165,000 ounces of the platinum metals annually, including scrap. Of this amount, the jewelry industry uses nearly 50%, laboratory 10% to 15%, and the remainder in a variety of ways, such as dental work, electrical apparatus, magnetos, and many other purposes.

The demand for this group of metals is bound to increase with industrial development and the advance of civilization. For many purposes satisfactory substitutes have been discovered and made use of, but in many cases it appears difficult to obtain a satisfactory substitute.

The increase of demand has raised the price enormously during recent decades, but in spite of this, the total output seems to be decreasing.

This is especially true of Russia, which is by far the heaviest producer, and whose output during the past three years has been almost cut off by internal disorders. So serious does this shortage promise to become, that it is now proposed to place these metals, among others, under international control, by which the world output will be apportioned according to the needs of the respective nations.

Some tables showing the production and price for the past few years follow:

Production of Platinum and Palladium ('Mineral Resources', 1915)

Thanks are due to the owners of the property for permission to use and publish the above data. H. R. Chilberg, of Seattle, is general manager for the company, Fred Chapman, superintendent in charge, V. Gleason, mill-foreman, and A. L. Howard is chemist and assayer. Andrew G. Larson, of Spokane, is consulting engineer for the company.

Domestic Chrome Industry Declines

Chrome mining in the United States has nearly ceased, according to reports for the first six months of 1919 received by the U. S. Geological Survey from nearly 300 correspondents who were operators or owners of chrome mines in 1918. Between January 1 and July 1, 1919, about 1400 tons of chrome ore was mined and shipped from three mines, two in San Luis Obispo county, California, and one in Wyoming. In addition 300 tons of chrome ore mined in 1918 was marketed during that period. The two mines in California appear to have been closed down, at least for the present.

This condition shows a remarkable contrast to that which prevailed in 1918, when there were nearly 600 active owners and operators of chrome properties and the total quantity of chrome ore shipped was 82,350 long tons of all grades, by far the greatest annual output of domestic chrome ore ever marketed in this country. In 1918 California produced 63,064 long tons, Oregon produced 18,455 long tons, and Maryland, North Carolina, Washington, and Wyoming produced the remainder. Georgia, Montana, and Pennsylvania produced some ore in 1918 but did not ship any.

The ore shipped in 1918 ranged in content of chromic oxide from less than 35 to more than 45% and averaged 41.7%. Most of the ore shipped during the first six

months of 1919 has ranged in content of chromic oxide from 34 to 51%, that from California being of the better grade. The average price of the ore mined in 1918 was nearly \$48 per ton. The price of the ore sold in 1919 ranged from \$13 to \$63 per short ton, and the average price was nearly \$26 per ton.

The ore imported from overseas is reckoned as of 50% grade, and the total quantity of domestic ore shipped in 1918, if calculated as containing 50% of chromic oxide, would amount to 68,680 long tons. In addition to the large quantity of domestic chrome ore shipped in 1918 there was 42,687 long tons mined, but not shipped or sold, remaining in the hands of the miners December 31, 1918. The War Minerals Relief Commission is now investigating the claims of miners for losses incurred.

The imports of chrome ore during the first half of 1919 amounted to 19,658 long tons. Nearly half of it came overseas from Oceania, and the average price of the ore in the country of its origin is reported to have been about \$36 per long ton. The decline in the domestic production and market in the first half of 1919 is general and overwhelming, sparing only localities favored by cheapness of local transportation, high grade of ore, or cheapness of production.

Chicago Meeting of the American Institute of Mining and Metallurgical Engineers

By Our Own Correspondent

THE CHICAGO DISTRICT

Those members of the Institute who attended the 120th meeting at Chicago and who made the trips to the various industrial plants and mines of that vicinity made the acquaintance of some of America's foremost industrial institutions. Chicago, the second American city and greatest railway centre in the world, has within the last fifteen years gained world prominence in the iron and steel industry and it was around this industry that this meeting of the Institute was largely planned.

Chicago's position on the main lines of the national trade-routes and its splendid accessibility to both ore and fuel has resulted in a national development of the iron and steel industry in this district. The first discovery of coal in the United States was made in Illinois as shown by Joliet's map and Margry's account of Joliet's voyage. "The said Joliet adds that he set down in his journal an exact Description of the Iron Mines they discovered as also of the Quarries of Marble and Cole-Pits, and places where they find Salt-Petre with several other things." During the pioneer days at the beginning of the 19th century coal was mined in Illinois where it outcropped. The development of the Illinois-Wisconsin lead and zinc deposits, which were originally worked by the Indians, played a large part in the development of the Mid-West.

The Lake Superior district contains about 70% of the available iron ore and 95% of the low-grade reserve ore-supply of the United States. The U. S. Geological Survey estimates the tonnage of available ore at three and a half billion long tons and of low-grade reserve-ore at 72 billion tons. A part of the ore is smelted in the Lake Superior district but the bulk of it goes to lake-shore points and to Pittsburgh. Of some 64 million tons of ore mined in the Lake Superior district in 1916 about one-fifth was received at Lake Michigan ports, Gary and South Chicago receiving about 10 million tons.

At Gary the U. S. Steel Corporation has 12 blast-furnaces, two Bessemer converters, and 46 open-hearth furnaces, besides mills for making various steel products. The corporation also operates a large by-product coke-plant. The Inland Steel Co.'s plant covers 245 acres and a mile of lake frontage. The South Chicago Works of the Illinois Steel Co. has 11 blast-furnaces, three Bessemer converters, and 35 open-hearth furnaces. This company has been a pioneer in the development and use of large electric furnaces. These are but a few of the steel manufacturing plants in the Chicago district. There are fifty or more iron and steel companies that do not reduce ore, such as the American Bridge Co., American Sheet & Tin Plate, Republic Iron & Steel Co., Inter-

state Iron & Steel Co., the Steel & Tube Co. of America, American Steel Foundries Co., Standard Forgings, and the Crane Co. the largest manufacturers of valve-iron in the world.

The eastern interior coalfield comprising Illinois and western Indiana and the northern interior coalfield, which is entirely within the boundaries of Michigan, hold the coal reserves closest to the Chicago region. The seams lie at shallow depths, only one mine being 1000 ft. deep, and stripping mines are common in some districts. The veins are persistent over broad areas, many of them average four to six or seven feet in thickness with a maximum of ten feet or even more. The coal is sub-bituminous to bituminous in quality and generally relatively high in sulphur. In 1917 Illinois and Indiana produced 86 and 26½ million tons respectively and Michigan over a million tons.

The coke industry of the Chicago district has kept pace with the iron and steel industry. At present 980 ovens are in operation. The U. S. Steel Corporation has 700 Koppers ovens capable of coking 12,000 tons of coal per day. More than 2000 ovens are in use in the four Lake Michigan states.

The lead and zinc smelters, with one exception (the plant at Mineral Point, Wisconsin), are located outside the pre-production area. The others are in the coalfields at Hillsboro, East St. Louis, Collinsville, Danville, Peru, La Salle, Depue, Springfield, and Alton; and a refinery in the Indiana portion of the Chicago-Gary district. The processes used are well known to metallurgical engineers. The ore is roasted in kilns to remove the sulphur and transform the zinc content to oxide. The kiln is known generally as the Hegeler and has been adopted widely throughout the country. The sulphur gases are used in the manufacture of acid and the zinc oxide is treated in retort-furnaces.

Among the companies engaged in the refining of non-ferrous metals, the production of alloys and the like may be mentioned, the Fansteel Products Co., the Great Western Smelting & Refining Co., International Lead Refining Co., United States Metals Refining Co.; and others. Two refineries are located in the Chicago-Gary district, namely, that of the Standard Oil Co. at Whitney, with a capacity of 35,000 barrels of crude petroleum per day; and that of the Sinclair Refining Co. at East Chicago with a capacity of 6500 bbl. per day. The output of asphalt from the refineries in the Chicago district during 1917 was over 100,000 tons.

The fluorspar deposits of Hardin county, Illinois, are among the largest and purest in the world. Practically

the entire American market is supplied with spar as flux for foundry work and steel manufacture from this Illinois-Kentucky district.

The copper districts tributary to the Chicago district are confined to the upper peninsula of Michigan where the ore is mined, milled, and smelted. In 1917 Michigan produced about one-fourth the total output of the United States.

Gypsum is a mineral product distinctive of Michigan, where apparently inexhaustible deposits are found. Some of the largest beds are about 25 ft. thick. Most of the output is calcined for stucco, mixed wall-plasters, plaster-board, building-block, calcimines, and other products.

The lead and zinc districts tributary to Chicago are those of north-western Illinois and south-western Wisconsin, and Hardin county, Illinois, where some lead and zinc are found in association with the fluorspar. In 1917 the lead production was valued at about one million dollars and the zinc production at thirteen million dollars.

The Chicago district has long been prominent in the manufacture of mining, milling, and smelting equipment. The products from numerous local plants have a world-wide distribution and are well known to the readers of the 'Mining and Scientific Press'. Some of the visiting members availed themselves of the opportunity while at Chicago to become better acquainted with the companies that have been supplying their mines and mills with equipment. Among the best known manufacturers of machinery for use in metal mining and the allied industries in the Chicago district are the Allis-Chalmers Co., American Spiral Pipe Works, Chalmers & Williams, Chicago Pneumatic Tool Co., Deister Concentrator Co., Deister Machine Co., Dings Magnetic Separator Co., Siebe, Gorman & Co., Fairbanks, Morse & Co., Flexible Steel Lacing Co., Harring & King Perforating Co., O. F. Jordan Co., Justrite Manufacturing Co., Marathon Mill & Machine Works, Nordberg Manufacturing Co., the Sullivan Machinery Co., Western Wheeled Scraper Co., and the Wood Equipment Company.

In compiling this summary of the Chicago district as related to the mining industries, I acknowledge gratefully the co-operation of F. W. De Wolf of the Illinois Geological Survey, who was largely responsible for the splendid guide-book placed at the disposal of the members in attendance.

PAPERS AND DISCUSSIONS

A glance through the program of papers presented at the recent meeting emphasizes the wide scope of the activities embraced in the membership of the Institute. The many ramifications of the engineering profession represented in the Institute have been so specialized by the present generation of engineers as to make it quite evident that the general practitioner is archaic. A list of the papers presented in person, by proxy, or by title at the Chicago meeting would mean but little to the average reader or engineer whose day is devoted to the mining, milling, or smelting of ore.

Such subjects, while treated with a wealth of detail

and in a most commendable manner, as 'Deterioration of Nickel Spark-plug Terminals in Service', 'Heat Treatment of Duralumin', 'Mud Volcanoes of Colombia', 'Aircraft Steels', 'Erosion Tests of Rifle-barrels', 'Cooling Properties of Technical Quenching Liquids', 'Occurrence and Origin of Finely Disseminated Sulphur Compounds in Coal', 'Water and Chlorides in Cement Copper Briquettes', 'Pyrometry in the Tool-manufacturing Industry', and so on through the list to the 'Temperature of a Burning Cigar', while not making a general appeal, may be of interest to the chosen few and are perhaps worthy of a place in the ever-increasing library of technical literature. Possibly the 'Temperature of a Burning Cigar' should not be included among those of interest to the few, as most of us concede with Kipling that a "good cigar is a smoke."

The predominating note in the technical sessions was iron and steel, and their associated or allied industries. The Iron and Steel sessions proper covered various phases of the physical and chemical properties of steel and iron, heat treatment and metallography. The fabrication of steel also received attention in papers dealing with rails, tubing, and plates; the practice at the 'World's Largest Plate Mill' by C. G. Huston and the 'Manufacture of Steel Rails' by Robert W. Hunt being of particular and general interest.

The symposium on Sulphur-Coals embraced 13 papers covering a wide variety of topics; in their entirety these constitute a notable addition to the literature of the subject. The papers on the geographic distribution, occurrence, and origin of finely disseminated sulphur compounds, the geological aspects and forms in which sulphur occurs, formed a foundation for the subsequent papers dealing with the mechanical separation of sulphur minerals from coal, the removal from illuminating gas, sulphur in the coking process and in producer gas. The commercial recovery of pyrite and the effect of sulphur in coal used in the ceramic industries completed the discussion of the subject.

The symposium on Pyrometry was most elaborate, consisting in all of 53 papers. To attempt a summary in the space afforded would be akin to the effort of inscribing the Lords Prayer on the head of a pin. Those who are interested in pyrometry will find this symposium, which was prepared in co-operation with the National Research Council of the U. S. Bureau of Standards, a valuable work of reference. It is to be hoped that it can be published as such and so kept intact for future use. The seeker after information will find there a detailed discussion of every branch of the subject from the 'Fundamentals of Pyrometry' to the 'Temperature of a Burning Cigar'.

The session on Non-ferrous Metallurgy included an interesting paper by Charles H. Fulton on the 'Electric-resistance Furnace of Large Capacity for Zinc Ores' and a paper on 'Electrolytic Zinc' by C. A. Hansen. The 'Treating of Antimony Ores' was presented by George P. Hulst. 'Water and Chlorides in Cement Copper Briquettes' by Edward Keller and 'Chemical and Electro-chemical Problems Involved in New Cornelia Copper

Company's Leaching Process' by Henry S. Mackay were presented by title.

The session on Non-ferrous Metallography was devoted to a discussion of the papers, which were read by title only and were presented at the Philadelphia meeting of the Institute of Metals division on September 29. In all, 15 papers composed this group. The session on 'Mine Taxation' was extended over two days with four sessions and was in many respects the most important of the meeting. A detailed report of this session will be found elsewhere.

The Coal and Gas session was devoted primarily to Middle-West problems as regards engineering practice in Illinois and Indiana. Gas-producer practice and the testing of coals for by-product coking and gas manufacture, and other kindred subjects came up for discussion.

The Wisconsin zinc district was described in a paper by W. F. Boericke and T. H. Garnett; and the 'Mineral Resources of the La Salle District' by J. A. Ede at the session on 'Mining and Local Resources'. Other papers included 'Mining Methods of Alaska Gastineau Mining Co.' by G. T. Jackson, 'Tunnel-driving at Copper Mountain, B. C.' by Oscar Lachmund, 'Wedging Diamond-drill Holes' by O. Hall and V. P. Row' and the 'Geology and Mining Methods at Pilares Mine' by W. R. Wade and Alfred Wandtke.

The session on Geology was devoted to sundry articles on subjects pertaining largely to the secondary minerals, such as 'Chrome-ore Deposits in Cuba' by Ernest F. Burchard; also 'Manganese-ore Deposits in Cuba', by the same author. J. S. Diller presented a paper on 'Recent Studies of Domestic Chromite Deposits'. A paper by C. D. Dolman on 'Magnesite, its Geology Products and Their Uses' was presented by title. 'Recent Studies on Manganese Deposits', by E. C. Harder and D. F. Hewett, was also presented. The session on Milling was devoted to four articles and their discussion. 'Chilean-mill Practice at Portland Mill' by Luther W. Lennox; 'Graphic Metallurgical Control', by H. M. Merry; 'Mill Operations at the United Eastern during 1917-'18', by Wheeler O. North; and 'Crushing Practice at New Cornelia Copper Company', by W. L. Dumoulin, published in our issue of August 30.

The session on Oil was made up largely of papers dealing with oil-producing districts and the production of petroleum, papers being presented by title in large part. 'Value of American Oil-shales', by Charles Baskerville, introduced a subject of considerable interest.

The session on Industrial Organization was limited to papers by C. F. Willis on the practice at the Copper Queen property; these were read by T. T. Read. The subject of industrial organization is coming to be one of steadily increasing importance to mine-operators by reason of complex labor problems and the necessity for the utmost efficiency. The Copper Queen is one of the companies that has taken particular interest in the subject, and the account of some of their methods was most timely. The discussion was most interesting and was participated in by A. M. Plumb, C. H. Benedict, Robert Ammon, T. T. Read, and others. The discussion of the

bonus and dividend systems at Mascot, Tennessee, and the Wisconsin Zinc Co. were of special interest.

The technical program was one of the most elaborate that has been presented at any meeting of the Institute. A greater number of papers were offered at the present meeting than at any previous one. While coal, iron, and steel occupied the centre of the stage, there was a number of papers of no little interest to the metal miner in the sessions on taxation, milling, and industrial organization.

It was to be regretted that the trip to Gary was necessarily declared off because of the steel strike. The trips to La Salle, the Franklin county coalfield, North Chicago, Milwaukee (as guests of the Allis-Chalmers Co.), East Chicago, and numerous sight-seeing trips for the ladies were all well attended and much enjoyed. So many different kinds of mining and metallurgical plants are located in the Chicago district that the individual preference as to the class of operations could be satisfied in almost every instance by the program provided. As the secretary, Bradley Stoughton, stated at the banquet, it was very much the consensus of opinion among those in attendance at the meeting that the Chicago meeting will go on record as one of the best planned and best attended in the Institute's history.

MINE TAXATION

The discussion of Mr. Graton's paper extended over three sessions, it being felt by those in attendance that the subject was of such vital importance at this time as to warrant the additional sessions and give the members an opportunity to express their views not only before the meeting but also to Mr. Graton of the Bureau of Internal Revenue. It is gratifying to call attention to the attitude of mind on the part of the director of the Bureau and of his associates who are exceedingly anxious to have a thorough ventilation of this subject by the mine operators and the benefit of their advice. When it is considered that there are 35,000 producing mines to be valued, all of which are different one from another, the task confronting the Bureau is stupendous. A corps of engineers is being organized and the industry will be divided according to the various classes of mining work, that is, iron, gold and silver, lead and zinc, copper, etc. The engineers who are most familiar with the various classes of mines will be assigned to their sub-division of the work in valuation. It is recognized to be impossible to do all this work in the field, hence the mine operators themselves will be relied upon in large part for data and assistance.

The Bureau recognizes the difference in coal and metal mining operations, coal mining being more nearly in line with the manufacturing industries than is the metal-mining branch, although no exact parallel is possible. R. V. Norris of the War Industries Board brought out a number of interesting features of coal mining as related to the present law, that is, the leasing system, simplicity of the mining problem, and valuation of properties, the mining risk as to coal supply, and the various hazards as

to gas, dust, and explosions. He pointed out that coal reserves to be mined a long time in the future, should not be considered as reserves that are commercially available and of fixed value; because the character of operating conditions 25 or 50 years hence cannot be foreseen. He showed the difficulty of supplying maps in connection with valuation reports. On the scale of one inch to 100 ft., as required, many properties with which he is familiar would need a special building in Washington in which to file them. He believed that 6% plus a fair rate of amortization was a reasonable return on an investment in coal mining.

It was also brought out in discussion that where two properties are almost identical as to physical features, it often happens that one is a good dividend-paying investment, while the other is not, the difference being due largely to management. The question is raised as to whether it was fair to penalize efficient management in the way of taxation. The war years, it was contended, could not be used as a proper basis for valuation of properties because of the abnormal conditions then prevailing. Operating conditions up to 1913, that is, the tonnage produced, is suggested as a fair basis for estimating future operations. The difficulty that might arise from unfair local valuation was discussed.

W. O. Hotchkiss emphasized the importance of having the proper personnel in the Internal Revenue Department to conduct examination work. He pointed out that it was almost impossible to get capable men for these positions at the salaries the Government was willing to pay, and urgently recommended that adequate remuneration be available to secure the type of men needed to do the work properly. He also touched upon the importance of the problem of fixing the interest-rate on valuation together with discount-rates. The regulation of the Bureau requiring a valuation 30 days after discovery brought up the query of when is a mine discovered and how can the date be fixed. This subject was discussed energetically by various members and occupied a good part of a session. This ruling was made originally to apply to oil and gas properties and it seems that through ignorance it was made also to apply to mines. While no definite ruling is available in regard to this question, it seemed to be the consensus of opinion at the meeting that a mine was discovered when a sufficiently large orebody had been clearly defined and mining operations commenced. The meeting was assured that it was not the purpose of the Bureau to require the impossible of mine operators and that their procedure must necessarily be governed by experience and the conditions peculiar to each case.

William Belding, a lawyer connected with Cleveland-Cliffs Iron Co., reviewed the various tax laws from 1909 to 1918 and pointed out some of the difficulties of their incidence. He pointed out that the three important elements entering into the tax law are income, excess profit, and capital stock. As against these, the deductions allowable are depletion, invested capital, and the market-value. As regards invested capital, he discussed the different practices of various companies, some of which showed no relation between capital stock and assets, the

properties being decidedly over-capitalized, as against companies which have a conservative management, whose tendency is in the opposite direction. This matter of capitalization is one that tends to create an unequal balance between tax-payers, and, as such, was contended to be unfair.

Paul Armitage, a lawyer from New York, also discussed Mr. Graton's paper with special reference to the matter of depletion. The Government regulations, it seems, allow but one method of calculating depletion, that is, a uniform depletion based on available tonnage and the life of the mine. He insisted that this is unfair, because the rate of depletion is not uniform and it is a matter subject largely to local conditions. In a great many properties, the first few years of operation show the greatest depletion while in others it is toward the end of the life of a mine that depletion is greatest. He contends that what is stated in the law of 1918, namely, "a reasonable depletion according to the peculiar conditions," cannot be applied under the present Federal regulations. He recommended that rulings as to the calculation of both depletion and depreciation must be made so as to apply them equitably.

In the course of discussion, it was moved and carried that the president of the Institute be asked to appoint a committee on 'Mine Taxation' to confer and co-operate with the Bureau of Internal Revenue. It is hoped that through this committee the Institute will bring to the attention of the Bureau of Internal Revenue from time to time various suggestions and recommendations for the administration of the Federal taxes on mines.

THE REFINING OF TUNGSTEN AND MOLYBDENUM

One of the most interesting of the trips taken by Institute members was to North Chicago to visit the tungsten and molybdenum refinery of the Fansteel Company. The refining of the rare minerals has been kept very much a secret, therefore we are much indebted to Dr. C. W. Balke, the chemical director of the Fansteel Company, for his liberal policy in giving detailed information regarding the process and also for the description, which follows.

Metallic tungsten for many metallurgical purposes is rather easily produced at a low cost by various methods, but to obtain an exceptionally pure metal suitable for the fabrication of electrical devices a different method and a much more expensive one is necessary. The Fansteel Company requires a purity in its metal of over 99.75% and its actual product varies between 99.9 and 99.95%. The impurities in the final product consist of alumina, iron, and calcium oxide. The process of manufacturing tungsten of this purity begins with the ore. Almost any ore can be used, but it is economical to use a high grade of wolframite.

The ore is crushed in a disc-mill and further pulverized in a pebble-mill until it will all pass through a 100-mesh screen. About half its weight of soda-ash is added to the finely divided ore and the mixture is fused in a gas-furnace. The time for fusion varies from two to

three hours. The charge in the furnace is raked frequently during the fusion. When this operation is complete, the mixture is drawn onto an iron tray, broken, crushed, and ground again to 100-mesh and fused a second time. The crushed melt from the previous process is then leached with water in wooden tanks provided with agitators, the process being continued until a nearly saturated solution of sodium tungstate is obtained. This is passed through a filter-press. The filtered liquid is heated in a stoneware kettle or wooden tank, where it is stirred with a solution of calcium chloride until all the tungsten is precipitated as calcium tungstate. The calcium tungstate is washed with distilled water by decantation and is then decomposed, either in a wooden tank or in a stoneware kettle, with

peated with more liquor. The solid ammonium tungstate is washed several times with distilled water and dried on a suction-filter. The moist ammonium para-tungstate is treated with a mixture of concentrated nitric acid, hydrochloric acid, and water and then boiled gently. The tungstic acid resulting from this decomposition is washed with distilled water and then dried as completely as possible. Any degree of purity may be obtained by repeating this process a sufficient number of times. To produce the oxide from which the metal is made later the acid is ignited in silica crucibles either in a gas or an electric furnace until a heavy green oxide is obtained.

The oxide is reduced in an atmosphere of hydrogen in furnaces of special design. By controlling the temperature and the time of reduction the fineness of the

PRESS USED TO MAKE BARS OF TUNGSTEN FROM THE POWDERED METAL

ELECTRIC FURNACE FOR REDUCING TUNGSTIC OXIDE TO METAL

muriatic acid, the acid being heated to boiling with a steam jet and the calcium tungstate added gradually. This is boiled for 20 to 30 minutes. The tungstic acid settles out as a bright-yellow precipitate and the clear liquor containing calcium chloride is drawn off and used in further operations.

The tungstic acid is then washed with distilled water, first by decantation and finally in a stoneware suction-filter a number of times. After being dried for a short time it will contain approximately 50% moisture. This process should yield 85-95% of the tungstic acid that was in the original ore. As thus produced it frequently contains as much as 0.6% of iron and several other impurities, and is unsuited for the production of pure metal.

The crude tungstic acid is dissolved in boiling dilute ammonium hydroxide. If the solution is too concentrated the salt will crystallize in the filter-press and clog the filter-leaves. This solution is permitted to stand and settle for an hour or more, and is then filtered until absolutely clear. The greatest care must be taken in this process to keep all the equipment entirely free from dirt.

The clear solution is evaporated in steam-kettles until almost dry. The salt (ammonium para-tungstate) is removed from the bottom of the kettles and the process re-

metallic powder may be controlled. This fineness has a definite influence on the ultimate crystalline structure of the tungsten.

To produce the ingots from which worked tungsten is made, the powder is loaded into dies and compressed under extremely heavy pressure. The resultant ingots or bars are very fragile, very heavy, and quite hard. They are converted into ingots by a heat treatment known as sintering, which is also done in specially designed electric furnaces. The metal is heated to a temperature that permits the growth of crystals and not far below the melting-point. There is considerable shrinkage during the sintering process but no loss of weight, except where oxygen has had access to the heated bar. To prevent oxidation and ensure complete reduction, a hydrogen atmosphere is maintained in the sintering-furnaces.

Molybdenum is treated in a similar way. Because of its lower melting point, it is possible to reduce the oxide of molybdenum in a gas-furnace instead of electric furnaces; and the metal itself is softer, less brittle, and much more ductile. It oxidizes readily at the high temperatures necessary for working, and the furnaces designed for its use have a constant stream of hydrogen flowing through them.

It has been necessary for the Fansteel Company to design and build most of the equipment used in the processes. Undoubtedly great improvements will be made in due course and it may be possible to eliminate some of the intermediate processes without interfering with the final results.

THE SMOKER

This, like previous gatherings of the same character, was marked by good-fellowship, an opportunity being given to rub elbows and chat informally. The present meeting marked a departure from precedent in that the ladies occupied the mezzanine floor of the hall and with their husbands and friends enjoyed the festivities. Several hundred members attended the smoker and the program was rich in surprises. At the start the Secretary, Bradley Stoughton, took pleasure in introducing Dr. Eu Chin Chan, who was announced as prominent in the mining activities of the Orient and as coming with credentials from H. Foster Bain. It was stated that Dr. Chan was making a tour of this country in the company of his secretary and interpreter. E. Gybbon Spilsbury had taken a kindly interest in Dr. Chan and had introduced him to members. Dr. Chan appeared in native costume and made a short address in Chinese, this being warmly applauded. While his secretary was translating his address, a commotion in the rear of the hall was occasioned by the entrance of an undesirable person who was minus a coat and collar and who boisterously interrupted the meeting by searching for someone against whom he had a decided grievance. Finally, making his way to the front, he discovered Dr. Chan and immediately proceeded to accuse him of being his laundry-man who had defaulted with his last week's wash. As Dr. Chan and his secretary made a hurried retreat from the hall, amid laughter, it became evident that the audience had been pleasantly fooled.

The illustrated talks by Messrs. Rice and Cottrell on their recent trip to the devastated areas of France, with particular reference to mine operations, were of exceptional interest and brought home to members the enormous handicap under which the mining industry of France starts its reconstruction. Dr. Cottrell's talk on the harnessing of volcanic activity in northern Italy and the conversion into power of this source of energy was exceedingly interesting. In this district the fumeroles have been tapped by pipe-lines which bring the steam to the central power-house, where 800 hp. is generated in low-pressure steam-turbines. He stated that it had been estimated that at least 100,000 hp. was available from this source of supply in one locality alone. In view of the high prices of fuel and its scarcity in Italy, this source of power promises to be one of real economic importance and offers a big field for future development. He also directed attention to the helium content of gases as found in the fumeroles of this district and the possibility of their importance from this standpoint. Dr. Cottrell's talk was splendidly illustrated with slides, which

gave his audience a realistic impression of the work being done in that district.

Sidney Smith, the originator of the Gump family, so familiar to readers of the Chicago 'Tribune', entertained the audience with caricatures of some of the Institute members. H. T. Walsh's one-act comedy entitled 'The A. I. M. & M. E. (Almost Incorporated Mining & Milling Enterprise)' was productive of no little merriment, particularly among those intimately acquainted with the *dramatis personae*. The subject was J. D. Oil's enterprise, in which Mr. Walsh introduced Horace V. Winchell as office-boy; John Hays Hammond as engineer; H. C. L. Hoover as boarding-house proprietor; Sidney Jennings as mine-superintendent; John D. Ryan as capitalist; also D. C. Jackling and L. D. Ricketts; Mrs. Bradley Stoughton as stenographer; T. A. Rickard as advertising manager; and others well known to the profession.

A buffet luncheon was served and it was amply demonstrated that there is as much good fellowship in a stein of less than 1% as in anti-prohibition beverages.

The opportunity afforded by the Institute meeting for social intercourse is a phase of these foregatherings the importance of which cannot be over-emphasized. Indeed, a large part of the members who attend the meetings are interested in but a small percentage of the technical papers and discussions, which are outside the scope of their personal experience. There is this one common ground, however, on which all can meet, and that is the fraternization of co-workers. In this respect the present meeting fully lived up to the standard set in the past.

THE BANQUET

Close to a thousand members and guests of the Institute attended the banquet. The human and non-technical side of engineering work was the key-note of the speeches made by the president, Horace V. Winchell, Theodore W. Robinson, vice-president of the Illinois Steel Corporation, and the principal guest—the 'Star of Bethlehem' as designated by Mr. Robinson—Charles M. Schwab.

Mr. Winchell took as his theme the prevailing attitude of engineers toward civic affairs and the lamentable fact that more engineers did not take an active interest in public affairs but confined their activities closely to the work of their profession. He spoke of the enormous opportunity offered at the present time to engineers as a body and as individuals in the public work of our country and of their splendid qualifications for the performance of such work in connection with national or local affairs. At the present time, when our national life is entering upon a period of reconstruction and problems of great weight must be met and solved by the American people, there is no class of men better qualified to take a hand in this work of reconstruction than the engineers; and he urged that the engineers individually and collectively should not shirk this duty or pass the responsibility to another but become a part, as much as their circumstances would permit, of the force that will mold public opinion and shape national affairs.

F. S. Peabody made a plea for the modification of the Sherman Law as it affects inter-state commerce in coal or else the enactment of national legislation equalizing competition in all the States. He also spoke upon the conservation of mineral resources, particularly coal, and urged that legislation be enacted that would penalize mine-operators who were robbing the earth and the generations to come by their wasteful methods.

Theodore W. Robinson responded eloquently to the toast of 'Chicago—the city of destiny'. In closing his eloquent address, he called attention to the fact that as "an aftermath from the War we are faced with momentous social changes, which in their extent and intensity are unparalleled in history. To fail to recognize their power is to endanger not only our industrial supremacy but the very stability of our institutions. The causes of our social discontent are partly psychological and partly economic. Ninety-nine per cent of our men are innately honest but they are at the same time innately selfish. The danger lies not so much because labor is asking a larger share of the fruits of its industry, but because, wilfully or otherwise, this share is so often sought in violation of economic law and sometimes in defiance of statute law. The distinction between a man unjustly taking the property of another man and a man obtaining a larger part of what he may produce is the difference between robbery and increased industrial reward. That the ethics of this distinction sometimes rests lightly, even in high circles, is occasionally evidenced by actual or proposed vicious class legislation. The burning questions of the hour are the high cost of living, higher wages, and shorter hours. Throughout the land there is strike on strike; H. C. L. has become a social as well as a chemical symbol. Both spell corrosion, but with the essential difference that hydrochloric acid is the handmaiden of industry and the high cost of living is apt to be the handmaiden of energy. In many trades and industries, the increase in wages has more than reasonably off-set the increase in living costs, but the demand for shorter hours fails to recognize the vital necessity for maximum output at a time when the waste of war as well as current need must be met. The power of example is, of course, second only to the resultant power of public opinion. If our last constitutional amendment may serve as a lesson, why not then, as with prohibition, make the necessity of increasing industrial efficiency and the exercise of personal economy a moral issue? If there could be developed against the spendthrift and industrial shirker a popular sentiment akin to that which during the War obtained against the army slacker, the high cost of living and our social unrest would soon disappear. Our people are sovereign in their power. If knowledge and clear thinking do not lead, ignorance and blind self-interest will. If you believe that the throes of the present world-wide social revolutions are fraught with danger to our traditions, to our rights of property, and to our institutions, then it is your duty—you men of the Institute—to preach in all cities and throughout the land the gospel of hard work, thrift, and loyalty. How vitally necessary is such action is demonstrated by the wide and nationally

momentous strike that has been inaugurated against the United States Steel Corporation and other interests. The steel strike is foreign radicalism transplanted. It is not based upon a demand in respect to wages or working conditions. It was distinctly predicated upon forcing the principle of the 'closed shop' upon this country, and the later formulation of grievances will in no wise mislead nor detract from the vicious attack upon the rights and freedom of our people. Judge Gary recently declined to meet certain labor leaders because he rightfully did not feel that they were authorized to speak for a large number of employees, and because a conference with them would have been treated as a recognition of the 'closed shop' principle. The United States Steel Corporation has always stood for the 'open shop', and union men and non-union men have satisfactorily worked side by side in its mills for years. The corporation feels that the principle of the 'open shop' is vital to liberty of conscience and freedom of action and a benefit to both employer and employee. It believes that the country will not stand for the 'closed shop' because it means decreased production, stunted initiative, and high cost of living. The present contest marks a grave crisis in the industrial history of our country. It is not a fight for the right to unionize nor against the right to unionize. It is a fight of a militant minority to try to force class distinction and power upon a peaceful majority. It is a conflict upon the result of which will largely depend whether four million organized men shall dictate to twenty-five million un-organized men how they shall work, where they shall work, or whether they shall work at all. This is not Americanism, it is not true unionism, and I have faith that the patriotism and common-sense of the American people will see that right and justice shall prevail."

Mr. Robinson's remarks were warmly applauded, and while Mr. Schwab has up to this time refused to make any comment upon the present industrial situation as regards the steel industry, it was to be noted that Mr. Robinson's remarks were applauded by him.

The Institute is to be congratulated upon having had with them, as the guest of the evening, Mr. Charles M. Schwab, it being the only occasion upon which he has consented this year to appear at a banquet. However, as he stated, when he received a letter from his old friend Captain Robert W. Hunt, he said to his good wife that it was impossible for him to refuse Captain Hunt anything and he would take pleasure in going to Chicago and talking to the Institute members at their banquet. Mr. Schwab's address was devoted in large part to what he pleased to call 'human engineering'. His talk was interspersed with humorous stories and anecdotes which kept his audience amused as well as interested. He stated, in part: "The engineers of this country have placed this great country of ours in a pre-eminent position with everything pertaining to manufacture, metallurgy, and the kindred arts. We are second to none in this world. We have a great country which God has endowed with such riches in natural resources as no other country in the world, but rich as these are when viewed

by you, the engineers of the country, there is one thing greater than these resources and that is the sturdy character, energy, and integrity of its people, which will make these great resources of influence in the world's development. There is one problem of our engineering that I term today 'human engineering', which is of far more importance than the creation of machines and methods with which you have been so successful in the past. Of what value is the skilfully devised machine and the complex process unless manned and operated by people whose heart and soul is in sympathy with the work which they are doing and whose purpose is the giving of a complete day's work for a day's pay. I have often heard of so-called German efficiency. We have before, and especially during the War, heard of the efficiency of German methods. Germany is the second-largest steel-producing country in the world and yet with all their production and ability there has not been a single great invention or process in the development of iron and steel that ever came out of Germany. What is the reason for their efficiency? I will tell you what I think it is. I think the basis of this so-called efficiency is an honest day's work for an honest day's pay. And when we teach, through our engineering ability and our methods, that the prosperity of the whole country, whether it be capitalist or workman, depends on doing an honest day's work for an honest day's pay, all these theoretical questions such as the high cost of living will naturally disappear. I am not at all in favor of artificial methods to reduce the high cost of living. There is but one way to do it and that is, first, by economy and, secondly, by industry and efficiency. When we get this throughout our establishments, the high cost of living will, by the natural laws of industry, adjust itself to its proper place. Therefore, you, the engineers of the country who have done so much for the development of our country, it seems to me, must face a new problem. You had as a member of your society, Andrew Carnegie, one of the greatest captains of industry. He was one of the greatest developers of industry in this country, and yet he was not technical nor had he skill in the arts which he so greatly developed. But above all he had that quality of human engineering that enabled him to draw about him a body of men who gave their very best on all occasions. He always believed in approval and never in criticism and I have yet to find the man worth-while in any station of life who does not always give his best efforts under the spirit of approval. The spirit of encouragement will always develop the best that is in any of us. In my establishment, I care little about the technical ability of a man if he has within him the sturdy qualities that makes men believe in his leadership, his honesty, and the pursuit and development of his work. It seems to me that you have this new branch before you in which a greater good can be done the country in this reconstructive development than by all the technical inventions and processes you can devise. We have won the greatest war, and we must not lose advantage of the lesson that we have learned by reason of the War; that lesson is, broadly, one that the President proclaimed as the lesson of democracy in the ordinary

sense of the term—that all men are men for what they are."

Captain Hunt, who presided at the banquet, is the dean of the Chicago engineers and his reputation as a toast-master at Institute meetings is built upon an experience over a great many years reaching from the Klondike to the Tropics. Although in his 'eighties, his eloquence, grace, and humor have in no sense waned and the Chicago section was indeed fortunate in having his good services on this occasion.

Mineral Production of United States in 1918

The Department of the Interior has just issued a preliminary report on the mineral production of the United States in 1918 for the purpose of making public as soon as possible the statistics collected by the U. S. Geological Survey for that year. The statistics given for most commodities are final; those for a few are only estimates based on incomplete returns; but on the whole the report gives a fairly complete record of the mineral output of the country during the year. The total value of the minerals produced was about \$5,526,000,000, more than half a billion dollars in excess of the value recorded for 1917, but the total quantity produced was less. The output of fuels was greater than in 1917, though somewhat less anthracite coal was marketed. The increase in the quantity of coal marketed was about 5%, but the increase in value, due to higher prices, was more than 17%. It is significant that though the increase in the quantity of petroleum marketed was only a little more than 4% the increase in value was over 32%.

The value of the metals produced was about 3% greater in 1918 than in 1917. The figures show that less iron ore and steel were produced, but here again values were higher. A little more pig-iron was made, though the quantity shipped was less. Copper and zinc not only in themselves but as the components of brass are perhaps next in importance to iron in the world's industry today, and in 1918 they stood high on the list of war metals. A little more copper but less zinc was produced, and the values of both were lower, that of zinc falling about 25%. The output of the war metals manganese and chromite, used in hardening steel, was greater than in any preceding year. Chromite increased 88% in quantity and 275% in value over 1917, and the increases in manganese ore were 136 and 100%, respectively. Less gold and silver were mined than for many years. Though the price of silver rose from 81c. per ounce in 1917 nearly to 97c. in 1918, the increase was not enough to cover the increased cost of mining. The output of building material—clay products, building stone, cement, lime, gypsum—showed a great decline. The domestic production of potash in 1918 was 54,000 tons, an increase of 68% over the output in 1917.

A MOLYBDENITE-BEARING quartz vein on Healy river, Alaska, which has been traced for the length of three claims, is the subject of a note by Theodore Chapin in Bulletin 692-F of the U. S. Geological Survey.

The Federal Taxation of Mines—I

Development of the Law as it Affects the Mine-Owner

By L. C. GRATON

*The fundamental object of taxation is not to impose a burden or a penalty on the taxpayer; rather the opposite; to secure the funds by means of which the Government may be enabled to extend to the taxpayer those benefits which he could not so well, if at all, secure for himself. Consequently, any program of taxation should be administered with the utmost sympathy and consideration, and with the least possible disturbance of the taxpayer's normal activities.

Until recently the Internal Revenue Bureau has been a relatively subordinate branch of the Government, and has had little attention from the average citizen. Since the passage of the income-tax amendment in 1913, however, and particularly since the rise of needs for enormous war-funds, the Revenue Bureau has become "an arm of the Government reaching out to every citizen and establishing a direct fiscal relationship with every business enterprise in the United States."

As all are aware, the revenue laws in so far as they specifically touch on the matters which relate to the mining industry, are nearly always brief and frequently not clear. These, like all other portions of the revenue laws, are made subject, for their interpretation and application, to regulations established by the Commissioner of Internal Revenue. It is most illuminating to observe how, as the importance and responsibility of the Commissioner's duties in this respect have expanded with the increasing magnitude of the taxes, the regulations with regard to the mining provisions of the law have with successive years reflected a greater and greater approach toward that fairness and equity which alone can be satisfactory and can lead to decisions that will hold. I beg of you to believe that every earnest effort is being made to eradicate and abandon all those things which have caused confusion, exasperation, or alarm to the honest and well-intentioned taxpayer. This message from the inside is a foremost object of my paper. It is, moreover, a necessary preliminary to the successful attainment of the second object, which is the securing of your co-operation and your help in solving a job that is as much yours as the Government's and that is no more to its advantage than to yours to have solved correctly. For notwithstanding every reasonable effort the Government may make, the job that confronts us is so big and difficult, has so many ramifications, that I believe the Government cannot master it single-handed, but must look to the specialized groups of taxpayers—in the case of mines, to the mine-owners, mining engineers, and geologists—for the advice

and help with which to put the deal through. The Government is in a frame of mind to trust you as reputable engineers, to trust not only your technical talents, but to trust also your motives and integrity; and you are invited and indeed urged to contribute, for the sake of the general welfare of the industry, such help as you can. In what follows, I shall try to indicate, in outline, some of the principal problems involved, though most of you no doubt have by necessity become familiar with them through your professional connections.

The Federal taxes on incomes and excess profits are heavy. In 1917, the value of the mineral production of the United States was a little over \$5,000,000,000. The total of Federal taxes for that year on the mineral-producing companies amounts to about \$207,000,000, and the total for the comprehensive group of mineral and metal industries to about \$766,000,000, which figures represent respectively 9.5% and 35.1% of the total paid by all corporations. For 1918 the taxes are still greater, but no compilations are yet available. Taxes at a high rate are to continue indefinitely. The subject is clearly of grave import to the mining industry.

In view of the peculiar conditions that attach to the tax program as applied to mines and other wasting industries, like oil, gas, and timber, the Commissioner has resorted to professional advice and assistance by manning a sub-division of Natural Resources with competent engineers, brought in from the several industries, into whose hands he has placed the technical questions involved.

The problems of mine taxation must necessarily be approached from a clear understanding of mining economics, of which the prominent and distinctive features are the hazard and the exhaustible character of the assets. Closely related to the latter feature is the necessity of maintaining efficient mining organizations indefinitely instead of limiting their existence to the life of the particular mine now being worked.

The principal questions to be settled revolve about the matter of mine valuation, but they are complicated by the fact that most of the values must be established as of a date several years ago. Among a variety of methods that might be employed, the one direct, professional, and established method is that which capitalizes income by determining the present value of total expected earnings. For the general application of this present-value method, there must be established a set of factors intended to adjust it to those examples which afford fewer data than the amount it requires ideally. Investigations must be conducted in more or less detail and thoroughness into a

*Abstract from paper presented before the Chicago meeting of the A. I. M. & M. E.

variety of subjects which enter into the application of the method, such as relation of interest-rates to hazard, ratio of proved to prospective ore in various types of deposits, effect of change in grade of ore and in rate of output, estimate of future selling-price of product, what constitutes discovery of a mine, and methods of depletion and depreciation. In the determination of all these matters a close touch with the industry will be maintained, with the sole idea of establishing principles that will be so sensible and sound that they may apply not only to the final settlement of taxes for the years now under review but may govern likewise through subsequent years so long as present or similar revenue laws prevail.

The applications and relations of capital to the mining industry involve different principles and are on a different basis from those in other forms of enterprise or investment. Two essential factors serve to distinguish the economics of mining from the economics of other industries: first, the much greater risk generally involved, and second, the fact that the life of the enterprise is fixed by conditions over which those engaged in it have but little control. In mining the raw material represents the chief investment and the raw material is the ore. Over that no man has control, and ordinarily, no one may know what or how much there is of it until he spends much good money to find out. If one company's operations demonstrate that, in a given tract of ground, Nature is not sufficiently generous to give man a profit, it would be a difficult matter to persuade anyone else to purchase the property. In such an instance every additional dollar spent by the company in development makes the situation worse and actually reduces the value of the property by eliminating the possibility that a better state of affairs may be disclosed.

Nor are the risks peculiar to mining limited to the question as to whether or not a given piece of ground will be found productive and worthy of the establishment upon it of an active operating mine, or whether the mine so established will continue to find profitable ore. The history of mining is filled with examples of important and temporarily profitable mines which gradually or suddenly came to grief in consequence of some of the accidents that constitute the other special hazards that peculiarly attach to the mining business. Witness the Alaska Treadwell. Mines at Butte, at Jerome, for example, have been on fire for years. Many a mine with good ore still in it had to be abandoned because water at last gained the upper hand. Every mine faces one or another of such catastrophes. In some respects, the greater the mine, the greater the menace. Clearly enough the abnormally high risk in mining must be offset by abnormally high returns. Clearly enough, the greater the hazard, the greater the portion of gross profit required to balance it.

It has also long been recognized by economists that mining is an industry of wasting assets and that the apparent income for a given year's operations is not true profit but part profit and part return of capital. The miner who sells his metal or his coal is selling not only his product, he is selling at the same time a part of his

mine. The price he receives per pound or per ton must cover both. It is to be hoped that the general attention to this subject which the present heavy tax burdens are going to force will greatly clarify the general understanding of the subject. In emphasizing the idea of wasting assets, Finlay has stated that a mine is exactly like an account in a bank whose business is to be wound up by a receiver. Hoover and others have implied, likewise, that the business of a mining company is to work out its mine as rapidly as it reasonably can.

Even more fundamental, however, than the conceptions which underlie these statements and in a sense contradictory to them, is a principle which is becoming more obvious and important each year, namely, that the business of a mining company should be the mining business, in just the same sense that the business of a railroad company is the railroad business. What I mean is this: the companies which are producing the largest part of the country's output of most of the metals have made enormous outlays in time, effort, intelligence, and money to build up organizations of great size and remarkable efficiency, which cover all steps from the ore in the ground to the finished metal. In large measure, it is because of the perfection and the efficiency of organizations like these, some of them great, others on the way to become great, that the world is buying its metal supplies at prices not greater than those which now prevail. Probably in even larger measure is the country's dominance in mineral production due as much to these highly perfected organizations as it is to the natural mineral wealth of the nation. To assume or to require that each of these great organizations must be torn down and thrown away when the particular lot of raw material, namely, the mine on which that particular company is operating, happens to be used up, would be not only rank folly, but would constitute an economic waste as direct and as deeply injurious to the public welfare as waste in the mining of coal, in the efficient utilization of water-power, or any of the other national extravagances or deficiencies which we are striving to overcome and eradicate. Evidences are constantly multiplying that large mining corporations realize that they must regard themselves as continuing organizations. They are providing or attempting to provide themselves with new supplies of raw material, that is, new mines, as soon as or before their present supplies give out. Since such a policy is sound and in accordance with public good, it must be both permitted and encouraged. In short, the mining company really ought to set by a fund for replacement rather than a fund merely for return of original capital, and this replacement fund ought to include an insurance factor to cover the extra risk involved in assuring to the company its new supply of raw material.

It is unnecessary to emphasize the importance of the place held by the mining industry of this country. In 1917, the latest year for which data are available, the value of the mineral production of the United States, as computed by the Geological Survey, amounted to \$5,011,000,000. This represents probably a larger portion of the estimated gross national income of \$68,000,000,000 for

that year than was contributed by any other single industry save the railroads. Indeed the only reason why the income of the railroads somewhat exceeded that of the mineral industry is because, as the Director of the U. S. Geological Survey has recently pointed out, the mines and smelters, oil-wells and refineries, quarries and cement-mills furnish to the railroads more than 4,000,000 tons of freight per day, or nearly twice as much as all other freight combined.

The 1917 mineral output is divided in round numbers as follows:

| | | % |
|------------------------|-----------------|-------|
| Principal metals | \$2,059,000,000 | 41.1 |
| Coal | 1,523,000,000 | 30.4 |
| Oil and gas | 703,000,000 | 14.0 |
| Miscellaneous | 726,000,000 | 14.5 |
| Total | \$5,011,000,000 | 100.0 |

Thus metal and coal mining accounts for 71.5% of the total mineral production of the country.

As would be expected from the gross income of the mineral industry, the portion of the total Federal taxes which this composite industry bears is very high. The taxes paid by the mineral industries in 1916 and 1917 amounted to \$31,000,000 and \$373,000,000, respectively.

Although the Federal tax laws as they apply to mines have not taken into account in any direct way the excessive risks involved in mining, they have lately given some recognition to the second difference that characterizes mining, namely, that its assets are exhaustible. This recognition comes under the head now designated in the laws as 'depletion'. Although various taxes were levied by the Federal government on mining companies and on mineral production during the Civil War, the first Federal tax in recent years to affect the mining industry was the corporation excise tax of 1909. It levied a tax of 1% on the net income above \$5000. This law provided, as a deduction from gross income to arrive at taxable net income, "a reasonable allowance for depreciation of property, if any," but did not specifically refer to depletion of mineral deposits. Many mining companies, however, in making their returns under this law made claims for depletion. The Internal Revenue Bureau allowed these claims until 1913, when the Supreme Court decreed that 'depreciation' as used in the law does not apply to exhaustion of mineral deposits and that therefore no deduction occasioned by this exhaustion could be allowed.

In 1913, however, after a special constitutional amendment had validated the principle of taxing incomes, the 1909 Excise Act was superseded by a new law. This levied a 1% tax on net income, which should be computed after deducting among other things, "a reasonable allowance for the exhaustion, wear and tear of property, arising out of its use or employment in the business, not to exceed in the case of mines, 5% of the gross value at the mine of the output for the year for which the computation is made." Thus the principles of both depreciation of physical property and depletion of mineral deposits were put upon a firm legal basis.

The 1913 revenue law was superseded by one in 1916

which levied 2% on the net income of corporations and provided tax-exempt deductions as follows: "A reasonable allowance for the exhaustion, wear and tear of property arising out of its use or employment in the business or trade." In the matter of depletion, oil and gas wells were for the first time specifically distinguished from mines. The oil and gas wells were granted "a reasonable allowance for actual deduction in flow and production," while to mines was given "a reasonable allowance for depletion thereof not to exceed the market value in the mine of the product thereof which has been mined and sold during the year for which the return and computation are made."

The 1917 law applied a 6% tax on corporation incomes with exactly the same terms as to depreciation and depletion as did the 1916 law, but to meet the heavy additional expenses of war there was also levied an excess-profit tax of from 20 to 60% on portions of the net income as determined in relation to invested capital. There was also inserted a provision that an additional 10 to 15% be levied on that portion of income undistributed six months after the end of the year, except such parts of that surplus as are actually invested and employed in the business or are retained for employment in the reasonable requirements of the business or are invested in Liberty bonds.

Finally, the law of 1918 levies a 12% tax on corporation incomes for the year 1918 and 10% for subsequent years. In this law, depreciation is covered by "a reasonable allowance for the exhaustion, wear and tear of property used in the trade or business, including a reasonable allowance for obsolescence," while with respect to depletion, the law provides: "In the case of mines, oil and gas wells, other natural deposits, and timber, a reasonable allowance for depletion and for depreciation of improvements, according to the peculiar conditions in each case, based upon cost including cost of development not otherwise deducted: Provided, that in the case of such properties acquired prior to March 1, 1913, the fair market-value of the property (or the taxpayer's interest therein) on that date shall be taken in lieu of cost up to that date: Provided further, that in the case of mines, oil and gas wells, discovered by the taxpayer, on or after March 1, 1913, and not acquired as the result of purchase of a proven tract or lease, where the fair market-value of the property is materially disproportionate to the cost, the depletion allowance shall be based upon the fair market-value of the property at the date of the discovery, or within 30 days thereafter."

There was also imposed a war-profit and excess-profit tax which provides for the collection on various fractions of the income of amounts that range in 1918 up to as much as 80% of certain portions, and up to 40% for subsequent years.

Summed up, these several laws have provided for taxation of income at steadily increasing rates from 1% up to 12% for 1918. They have levied a heavy excess-profit tax in 1917 and still heavier in 1918. Both income and excess-profit taxes are continued indefinitely for years subsequent to 1918, though at rates somewhat lower than

for 1918. Allowance for depreciation of physical property has been provided for in the income tax of each of these years and has been extended to cover obsolescence beginning with 1918. Depletion has been treated in a different way with nearly every law. Allowances or depletion, specifically unauthorized by the first law, were granted until pronounced illegal by the Supreme Court. Then in 1913, a 5% allowance on the gross value of the year's product at the mine, in 1916 and 1917 an allowance not exceeding the market-value of the year's product in the mine, and in 1918, a reasonable allowance for depletion according to the peculiar conditions in each case, based generally upon market-value as of March 1, 1913, but allowing for re-valuation in case actual discovery subsequent to that date shall have materially increased the value.

On the whole, therefore, increasing taxes have been accompanied by increasing reasonableness and liberality as to tax-free deductions for depreciation and depletion, although, of course, the increase in the allowances has been of no such magnitude as the great increase in taxes.

It is clear that, whether the existing laws be reasonable or senseless, the activities of the Revenue Bureau are necessarily confined to the limitations that the laws impose. If the laws are found to be bad, it is to be hoped that their shortcomings may be so clearly pointed out that Congress will see fit to remedy them for the future; but unless relief, if found to be needed, shall subsequently be given and made retroactive, which seems unlikely, the procedure which must be followed for the present is already outlined in the laws. In the matter of mine taxation, we cannot be materially concerned with policies for taxing idle mineral lands or unprofitable mines, since neither class earns income. All we can do in the present connection is to take the laws as they are and apply them fairly.

The regulations which according to the laws are to be promulgated by the Commissioner of Internal Revenue for the interpretation and application of the tax laws have been written for each of the laws through 1918. But in their case, opportunity for revision and improvements is not excluded. For the desire and intention of the present Commissioner are, while adhering to the limits set by the law, to administer the tax program in the light of facts and equity. It is for the purpose of assisting in the formulation of rules and the making of decisions relating to minerals and related products that there has been gathered together a group of engineers to constitute the recently established Sub-division of Natural Resources of the Income Tax Unit. Obviously enough the main job of this Sub-division is one of valuation. The metal and coal mining problems have been but slightly touched as yet, in so far as concerns settlement of those features that depend upon valuation, for the determination of the taxes in 1917 and for the review of the taxes or 1916. The two fundamental objects to be achieved are, first, impartial balance as between different taxpayers in a given industry, and as between one industry and another, and second, finality of the decisions. If proper balance is attained, finality will be assured.

If, on the other hand, the decisions are not sensible and just, there is likely to be no end of revision and unsettling of results, so, after all, balance is the prime requisite. The Revenue Bureau will endeavor to act in the joint capacity of trustee for the taxpayer and for the Government and will seek to harmonize the interest of each.

The latest law clearly recognizes the wasting industries. The mining industry is thus among the few to which distinctive treatment of any kind is applied. However, not all the consequences of the exhaustible character of mines are provided for in the law, as, for example, the establishment of a replacement fund. Neither is special consideration afforded to cover the extra hazards involved in mining. For example, in the average business, the largest part of the investment is protected by insurance, and the expense of that insurance is properly charged into working costs. The largest part of the mining company's investment is represented by ore in the ground; the great and varied risks that attend the extraction of that ore cannot be insured against. The only insurance protection is afforded by the increased return to the investor. Yet high rate of interest results in the computation of low valuation, hence low depletion allowance, and consequently, high tax. And then instead of deducting from income his heavy insurance expenses, much heavier than in most other industries, the miner pays tax on it as if it were true profit.

Perhaps the requirement of next importance is that every effort be made to avoid setting up regulations and procedures that will furnish strong incentive to the mining company, in the hope of lessening its tax burden, to adopt practices or pursue policies contrary or foreign to the dictates of good sense and the well-founded customs of the industry. Such a policy would mean bad tax-collecting, bad mining, and therefore, in reality, bad morals. I do not refer to deliberate evasions of a culpable kind, but to acts which, though legitimate in the sense of not being illegal, are nevertheless wrong because artificial, indirect, and probably subversive of the public good.

As an example, there comes to mind the case of many ore deposits in limestone, where, because of the irregular distribution of the orebodies and the heavy character of the ground when the altered rock is exposed to the air, it is customary to carry development work not far ahead of current extraction. In the matter of valuation on the basis of exposed or proved ore such mines are clearly at a disadvantage with extensively developed mines like the 'porphyry' coppers. If, to overcome this disadvantage, one of these limestone mines should greatly expand its underground development and should thereby discover a proportionate amount of new ore, it might gain a higher valuation and thus, through greater depletion deduction, pay a lower tax. But the money thus saved to it (and lost to the Government) would be partly offset, perhaps eventually more than offset, by long-time interest charges on the expense of the idle development and by the likelihood that when finally needed for extraction purposes, the workings would require heavy repairs or be useless.

REVIEW OF MINING

ALASKA

The following exchange of statements between the Alaska Labor Union and the Alaska Juneau Gold Mining Co. are self-explanatory. They appeared as advertisements in the Alaska 'Daily Empire' of September 16. The strike to which they refer came to an end on September 30, the strikers returning to work on the terms of the company.

CHARGES AND DEMANDS

ALASKA LABOR UNION
Local No. 4

Juneau, Alaska, Sept. 15, 1919.

To the Office of the Alaska Juneau Gold Mining Co.
Juneau, Alaska.

Dear Sirs:

We, the workers of the Alaska Juneau mine, find that the present wages paid at the said mine are not sufficient to meet the present high cost of living.

The wages paid at this mine are pre-war wages, and since necessities of life have increased from one to three hundred per cent., the wages at the mine remain the same.

Wages in all mining camps throughout the country, with the exception of Juneau, have increased wages to meet the high cost of living.

We, the workers of the Alaska Juneau mine are organized for the following demands:

1. An increase in wages, of one dollar per day for all men in the mine working for the company.
2. An increase in wages, of one dollar per day for all men working for contractors or sub-contractors, the company to back the contractors for this increase.
3. No men to be kept underground for longer than eight hours in one day.
4. The board and room at the company's boarding house to remain the same, \$32.00 per month.
5. That the company put no worker on the "BLACK LIST" for making these demands, and after settlement all workers to be reinstated.

The above are the demands of the workers of the Alaska Juneau mine, and the undersigned committee have been appointed to negotiate settlement with the company.

JAMES FOGARTY,
G. WAGNER,
WILLIAM HILL,

Committee of the Workers:

REPLY

The Alaska Juneau Co. cannot pay an increase of \$1.00 per day as demanded because it is now operating at a loss.

The Alaska Juneau average pre-war wage was \$3.51 per day.

The Alaska Juneau average wage paid today is \$5.05, making an increase of \$1.54 per day.

While this raise in wages has been made voluntarily, no raise whatever has been made in the charge of board and lodging, which has remained at \$32.00 per month throughout, although at a loss now of forty cents per day per man to the company.

The total cost of a man to the Alaska Juneau Co. before the war, for wages, supplies, power, etc., consumed, averaged \$5.00 per day.

This total cost now averages \$11.00 per man per day, or for the 240 men now employed, a difference of \$43,000.00 per month, of increased cost to the Alaska Juneau Co. as against a pre-war cost for the same number of men.

It is well known that because of the high prices brought on by war conditions, that gold has lost one-half its purchasing power.

The Alaska Juneau enterprise is therefore not of a profiteering nature and does not lend itself as a hotbed for propagating Bolshevism.

Men working underground in the Alaska Juneau mine are earning more money than men working in the Kennecott Copper Mines are earning today after having had their wages raised \$1.00 per day last month.

The Alaska Juneau is a steady, continuous operation employing a continually increasing number of men, with an increasing average wage throughout the war period.

On the other hand, when the price of copper went down after the armistice, wages in the copper camps were not only reduced, but one-half of all the crews in the copper camps were arbitrarily discharged.

That is, in the profiteering business of copper mining, the public and the employee are made to stand the loss when the price of the product goes down; while in the case of the Alaska Juneau, the company's stockholders have been suffering a monthly loss throughout the war period, which loss till continues.

This monthly loss will unfortunately continue, until the present mill alterations and enlargements are completed.

It is well known that because of the experimental features in the company's new milling plant, it did not attain half of its promised capacity and that at an oper-

ating cost per ton three times larger than it should have been.

The construction work now going on is to correct these defects so as to place the property upon a profitable operating basis. Fifty more men are now needed to hurry this work along; and when completed, an industry will have been established that will give employment regularly to at least 600 men.

It should be apparent that it is not fair to compare the wages paid in a gold mining camp with wages paid in a profiteering copper mining camp; and if a comparison is made with other gold mining camps, it will be found that the Juneau district is paying the highest going wages.

The Juneau mines voluntarily raised wages over a year ago, while in the Grass Valley gold mining district of California the men struck last July for an increase of fifty cents per day. This strike was compromised by the men agreeing to accept an increase of 10%, but such increase to be payable to only such men as were continuously on the payroll of three months, unless off on leave or on account of sickness.

Even with this raise of last month in the Grass Valley gold mining district of California, the wages paid in the Juneau district are much higher.

A number of Alaska Juneau shareholders have sufficient confidence in the property to loan the company each month the funds necessary to pay all its bills in cash; but there is a general feeling amongst financiers that gold mining is in for a long period of depression and consequently it is becoming more and more difficult to raise money for gold mining purposes. Therefore, any tolerance or encouragement of any uncalled for and unfair agitation that would make the company's operations more costly, may result in an embarrassment that cannot be overcome.

The Alaska Juneau Co., of course, has to pay going wages in order to secure good men. It has been doing the very best it can in this matter and cannot accede to demands that on their face are borrowed from shipyard and copper conditions that are not at all comparable with conditions in the gold mines of the Juneau district.

ALASKA JUNEAU GOLD MINING Co.

REPLY TO THE ALASKA JUNEAU GOLD MINING COMPANY

The workers of the Alaska Juneau Mine believe that the company can pay the increase of \$1.00 per day and have voted unanimously to stay out until the demands presented to the company are met. We also believe the Alaska Juneau mine is on a paying basis, as no mine would operate at a loss merely to keep the mine open.

The Alaska Juneau Gold Mining Co. are not paying the \$1.54 per day increase on pre-war wages as they state, for if that sum was added to the pre-war wage it would be exactly what the miners are striking for now.

In getting this average increase, the company has taken in contractors, some of them making as high as \$15 to \$20 per day.

We agree with the Alaska Juneau Gold Mining Co.

that gold has only one half its former purchasing power.

This is true, for we find the same trouble with it ourselves. How about other minerals in the Alaska Juneau Mine, such as zinc, galena, iron, etc., which have gone skyward and according to quotations, more so than copper?

Again, the Company states that it is not fair to compare the wages of a gold mining camp with that of a copper mining camp.

What is the difference between them? There is the same work in both. The Company also states that Juneau pays the highest wages in the country.

We wish the Company to mention one camp where the wages are lower than Juneau, and if an examination is made it will be found that Juneau is in arrears of from one to two dollars per day.

Company officials returning from a trip of inspection of other mines in Alaska about three weeks ago, stated that the Alaska Juneau mine was the best in Alaska; if so, our demands can be met.

We also wish to inform the Company that these demands are made on fair grounds, and have no Bolshevism in them as the Company intimated.

ALASKA LABOR UNION No. 4.

STRIKE COMMITTEE,

JAMES FOGARTY,

G. WAGNER,

WILLIAM HILL.

ARIZONA

NIGHT HAWK OBTAINING ENCOURAGING RESULTS.—GENERAL NEWS OF THE STATE.

BISBEE.—An important discovery has been made on the Night Hawk lease, near Don Luis in the south-eastern corner of the Warren district, which adds largely to the known ore-reserve of the property. After driving through 65 ft. of 8% ore and then through a fault about 20 ft., a round of holes shot on the night of September 26 resulted in opening a body of high-grade ore. The deposit is said to have the same characteristics as the ore-body opened up in the property off a winze on the 450-ft. level. On the latter level there was developed recently approximately 42 ft. of ore averaging 8% with streaks of high-grade running through it. The ore developed in the Night Hawk is sufficient to outlast the duration of the lease, which has approximately four and a half years to run. No more prospecting is considered necessary, although it is the general belief that depth would prove enrichment of the orebody. Credit for the new discovery is given by the company to James McKenna, foreman in charge of the work, who has carried out his own ideas in the development work. The Campbell shaft of the Calumet & Arizona company now is down 170 ft. from the surface. Work was resumed at this shaft in July this year, after having been abandoned since August 1917. The total depth of the shaft is to be 2200 ft. To investigate the possibility on the porphyry zone, represented by Sacramento hill of the Phelps Dodge corporation, the Calumet & Arizona has begun sinking a series

of churn-drill holes on the Campbell group near the Sacramento line. The first hole was started late in September. Two or three more will be put down before the test is considered complete.

HILLTOP.—Charles Berkey, professor of geology at Columbia University, assisted by Louis D. Huntoon, formerly professor of mining at Yale University, has been working for several weeks in this vicinity upon a geological survey of the Hilltop Metals Mining Co. and the Hilltop Extension Mining Co., the former owned by Chicago capitalists and the latter by New York interests. The survey was abandoned temporarily late in September, owing to Dr. Berkey being recalled to New York by the duties of his professorship, but will be resumed on October 25. At a recent meeting of stockholders of the Hilltop Metals Mining Co., held at Douglas, plans were formulated for building a railroad from the mine to Rodeo, New Mexico, there to join the El Paso & Southwestern. Tentative plans for building a smelter and mill also were discussed. The Hilltop has an excellent plant, particularly in the power division, which is furnished by a 300-hp. Diesel engine. Plans are said to be under contemplation whereby the Hilltop and the Hilltop Extension may co-operate more closely in development of their holdings. The Ajax property, 4 miles south of Hilltop, now is working steadily upon development. Completion of the shaft to the 200-ft. level was followed by cutting a station and driving in two directions to open orebodies traced upon the surface. The underground showing is said to be excellent.

COURTLAND.—The Great Western Copper Co. is shipping a carload of sulphide ore daily to the C & A smelter at Douglas. About 30 men are employed, in addition to several lessees working on its property. On the Leadville No. 2, O. T. Smith is working 20 men under a lease. He recently opened up an orebody said to average 6% copper. Peter Mouse, another lessee on the Leadville No. 2, is shipping an average of six carloads of 6% ore monthly.

PEARCE.—The Commonwealth Development Co., under direction of A. Y. Smith, is working the old tailing dump. About 250 tons of low-grade ore per week is being taken from the Commonwealth mine and run through the mill. Several lessees also are taking out silver ore which runs high in silica and therefore is received at a premium by the smelters because of its value as converter lining.

MIDDLEMARCH.—In order to resume operations it will be necessary for the Middlemarch Copper Co. to tear down the Diesel engine, which furnished motive power for its mill, to remove carborundum from the bearings. Discovery of the dust in the bearings was made by company officials, following a labor strike on the property. The discovery was made before the engine was turned over, thus averting what would have been very costly damage. The pumps also were closed down during the strike and in order to resume underground operations it will be necessary to unwater the mine, which was flooded during the shut-down. This will require several weeks.

MASCOT.—The Mascot Copper Co. has been working a test mill for more than a year and now has enlarged the

plant by installing four Wilfley tables to take care of the low-grade. Test runs made recently showed capacity for 24 hours to be approximately 150 tons.

GOLD PRINCE.—The Gold Prince Mining Co. is operating the old Bain mine, a gold property. A clean-up of between \$3000 and \$4000 is being made every two weeks. About 30 men are employed in the mine. G. Wilty is in charge.

PATAGONIA.—The World's Fair mine has resumed operations after having been closed down three months because of litigation. The Hardshell is sinking a three-compartment shaft which is now down about 400 ft. Tom Frazier is contractor. The Duquesne, under lease to Panick and Curry, is shipping about 400 tons of ore per month.

CALIFORNIA

GRASS VALLEY, SIERRA COUNTY, NEVADA CITY.

GRASS VALLEY.—An effort is being made by C. A. Brockington, superintendent of the Grass Valley Con. Mines Co. owner of the once famous Allison Ranch mine, to bring the mine again into the dividend class. For a number of years past the mine has been re-opened at different times, but after a short period of operation the bonds have always been allowed to lapse, although the rich streaks overlooked in former mining have yielded some good ore. The miners and lessees took the cream—a favorite and popular occupation in this district among the underground men. It has been a struggle for years with the various managements to restore the mine to its old time productiveness. The work in hand at present is mainly prospecting. Two drifts are being driven, one east and one west on a lower level. The one east is being driven into unexplored ground from which veins outcrop, although little is known of their surface tenor. That drift is now in nearly 700 ft. The west drift is being driven toward the Omaha and Hartery veins, both of which yielded bonanza ore in the upper levels. To cut these veins, of which the Hartery will be the first, will require a drift about 1100 ft. long. The former yield warrants the management in exploring these veins at depth in the hope of finding new shoots. A few 'tributers' are at work on low-grade ore of uncertain tenor, and some company ore is being mined. The mill, however, is running but one shift a day. The mine has been cleaned out of almost all its developed ore; its future depends entirely upon the result of the present prospecting.

SIERRA COUNTY.—Some months ago Fred Searls, Jr., of Nevada City, secured an option on the idle Tightner mine at Alleghany on terms and conditions that have not been made public. Recently, at Grass Valley, the directors met and formally executed an agreement under which work must commence within thirty days and proceed along given lines of development. Preparations have already been made for beginning operations. The underground work consists of a long tunnel and two shafts of 400 ft. each. These will have to be pumped out before the search for ore can commence. Although the

mine was considered exhausted at the time of closing, the Tightner had produced over \$1,500,000 within seven years, a fact that encourages the present search for new pockets. Lack of visible ore combined with war conditions compelled the closing. Under the transfer the old stockholders will receive a royalty and the option price will be paid over a period of years. With the bond the following properties are included: Tightner Placer, Eclipse, West Extension Eclipse, Aelene, Red Star, and Tightner claims; some 200 acres in all. Fred Searls, Jr. will be in charge. The surface plant consists of a 20-stamp-mill compressor, and accessory equipment, all electrically driven. The original mine was opened by H. S. Johnson and later sold to the Tightner Mining Co., the success of which caused the opening of a rich district. The district is still productive; although at present it is being operated at a disadvantage.

Smuggler Union Mining Co. mill construction is nearing completion and will soon be in condition to handle large tonnages. The shaft on the Black Bear is progressing, and shipments from the Black Bear will be resumed at an early date. The Liberty Bell Gold Mining Co. is leasing a block of Smuggler Union ground. Patents were applied for on the Happy Home Monarch and Moon Anchor lodes by Wichman and Olson. Driving along the vein on the Modena has opened up some good ore and shipment will be made at an early date. The Tomboy Gold Mines Co. has installed the third of a series of large ball-mills.

On the evening of September 10, a mysterious crime occurred at the portal of the Montana tunnel of the Tomboy, when four miners were killed while on their way to work on the night-shift. The men were shot down by two masked men, according to the report of witnesses,

THE INTEROCEAN MINE, BOULDER COUNTY, COLORADO

NEVADA CITY.—A recent transfer has been recorded from W. G. Motley and wife to Mrs. Lizzie H. Hoge, which includes the West Buckeye placer, Buckeye Extension, Bertha Extension, Cold Springs gravel, Buckeye, West Buckeye, and a part of the Willow Valley quartz claims, together with the hoisting, pumping, and milling plant. These properties are in a mineral-bearing district and are considered to be good prospects. The California Mining Co. is running a tunnel in the Cold Springs ground to reach a part of the Harmony ridge system. The tunnel has reached a length of over 800 ft. and is still in hard granite.

COLORADO

OPERATIONS IN THE TELLURIDE DISTRICT.—DETAILS OF THE CRIME AT THE TOMBOY.

TELLURIDE.—The shortage of labor has been relieved to some extent by the influx of a large number of laborers and miners recruited by labor rustlers during Fair week in Durango. Production is still very light. The

but no motive or clue as to the identity of the assassins has been discovered as yet. The victims were Eric Sund, Gus Danielson, Fred Smith, and Celeste Mattivi killed, and Joe Kochevr wounded. These men were members of contracting parties working on the 1000-ft. and 1150-ft. levels. The first information received of the trouble was when Kochevr staggered into the mine-office and reported the crime, stating that as he entered the tunnel with his companions they were fired upon by masked men, who aimed at their carbide lamps. Mattivi arrived later accompanied by Giacomozzi and Moletti, his partners, who were contracting on the 1000-ft. level, and, disregarding the warning of Kochevr, started toward the tunnel, when according to Giacomozzi and Moletti, two men at the portal of the tunnel opened fire, pursuing Mattivi to the dump and shooting him down at that point. A posse was formed of the sheriff and mine officials, who were on the ground within a short time. The bodies of Smith and Danielson were found at station 125, a room built off the drift for a lunch-room. Sund

was found mid-way between the station and the portal, and Mattivi on the dump outside. All the men had been shot below the ear in addition to other wounds, evidently to ensure death. A posse followed all the possible trails and clues, but no direct evidence was uncovered. At the inquest held on September 16, Moletti, Giacomozzi, and Kochevr were held on suspicion, and charges will probably be preferred against them. The various theories advanced as a motive for the crime are not substantiated by the facts. The theory that there was a battle among 'high-graders' is contradicted by the fact that there is no high-grade in this part of the mine. All the victims carried large sums of money, and valuables, but there was no robbery. There had been some feeling over the building of a fire in the stove at station 125, by the men working on 1150-ft. level, flooding the upper level with smoke and hindering the work of Mattivi, Moletti, and Giacomozzi, but the practice had been stopped. The general feeling over the crime is high, as it is a culmination of a series of crimes of like nature extending over the past few months, and there will be a determined effort to bring the criminals to justice. A reward totaling \$2500 for information leading to the conviction of the guilty men has been subscribed by the following: Tom-boy Gold Mines Co., Ltd., \$1000; the Liberty Bell Gold Mining Co., \$500; the Smuggler Union Mining Co., \$500; and the City Council, \$500.

MICHIGAN

LIFE INSURANCE POLICIES FOR CALUMET & HECLA
EMPLOYEES.—METAL SITUATION UNCHANGED.

The announcement of the Calumet & Hecla management of a blanket life insurance policy for everybody in their employ has caused much comment in the district. It is generally believed that other mining corporations operating in the Michigan copper district will follow the lead of the Calumet & Hecla and make similar appropriations for the benefit of their employees. In fact, a number of the corporations have been considering such action for some months but have not as yet ripened their plans to a point where they are ready for announcement. Calumet & Hecla and subsidiary interests now employ half of the mine workers of the Michigan copper district.

There is no evidence of any unrest among the workers in the district. Although there have been labor difficulties in practically every other district in the world in the past year, the Michigan district has been free from trouble of any sort, a fact that has occasioned considerable favorable comment. In fact there has been nothing in the way of unrest shown here since the Moyer-Mahoney group was defeated in its efforts to force the Western Federation of Miners upon the district. That strike was concluded in 1914. It was a long-fought struggle, but it ended decisively and the decision was that the Lake Superior district could continue to operate without the Western Federation. The defeat of the Moyer followers was the beginning of the disintegration of that strong miner's union, for the collapse of the Federation in Butte followed shortly afterward.

There is nothing new in the metal situation so far as may be observed. There has been no increase in either output or metal shipments. Mine managers hope that the negotiation of the 50 million Belgian loan in the United States will result in a stimulation of buying for foreign account, although the general feeling is that there can be no great impetus to the demand for Michigan copper, which is peculiarly adapted to German manufacturing needs, until the German business interests get into the market again.

The Mayflower-Old Colony shaft is now at a depth of 1520 ft., in trap. For 100 ft. the shaft has been alternating between trap and amygdaloid. Fine copper appears in the amygdaloid but not in the trap. First it was believed that the trap was the foot-wall of a known recognizable formation, but the extreme width and the continued breaking of the lode makes its identity uncertain. Mass Consolidated is making notable increase in shipments. Isle Royale continues to mine more ore than its mill can handle, the overflow going to the subsidiary on Torch lake. Last week 4000 tons went to the subsidiary mill, in addition to maintenance of daily normal tonnage of 2000 tons at its own 3-head mill. Ahmeek now is producing ore at the rate of 2600 tons daily and Osceola's combined tonnage is 2000, three quarters of which is coming from the Kearsarge. It is reported that Boston capital will finance Bear Lake exploration operations, where copper was found east of the sandstone. Victoria took out a 4-ton piece of mass copper last week and continues to encounter a lot of this material in the lower levels.

NEVADA

STRIKE SETTLED AT TONOPAH AND DIVIDE.—EUREKA
CROESUS TO BUILD CONCENTRATOR.

TONOPAH.—The Tonopah and Divide millmen's union, a new organization in the Tonopah and Divide districts, has reached an agreement with the operators, settling the strike that had kept the mines and mills inactive since August 17. The organization was formed for the purpose of ending the strike. Eighty-four miners signed when the union was organized. A member of the mine operators' association estimated that not to exceed 250 miners were in both districts on the day the strike ended. No wage increase was granted, but the operators, at a meeting with the workers two days before the strike ended, practically agreed to make both districts closed for a local union and also agreed to guarantee a 15% reduction in the cost of living through a general store to be opened by them. When the new union acted all of the craft unions had called off the strike and it was the intention of the operators to resume work regardless of what action was taken by the union. When the strike ended, Governor Boyle, aiming at the I. W. W. element, said in a statement: "Craftsmen and mine and mill workers in all of the labor organizations here which profess American principles have officially voted to return to work. No other type of organization or mob has any legal or other standing in this State, nor will any such

aggregation be permitted to libel any town or district in Nevada by any form of published or spoken allegation that a strike originated by it is in force or that any workman is a scab."

EUREKA.—Eugene Davis, principal owner of the Eureka Croesus Mining Co., has purchased the Eureka and Palisade railroad for a price reported to have been \$1,000,000, and it is planned to increase greatly the freight-carrying capacity of the road. Another locomotive recently was purchased and is in use hauling general freight and ore. The winze from the 400-ft. level of the Eureka Croesus is 275 ft. deep and ore assaying \$200 per ton in lead and silver is being shipped from it. The vein is 40 ft. wide and the ore is being broken over a width of 20 ft. No driving has been done from the winze. George O. Bradley of San Francisco has been employed to develop a process for treating the ore, and it is re-

strike. The Goldfield-Tule Canyon has spent over \$5000, but a large amount of work has been done in driving and cross-cutting and in improvements to the surface plant.

GOLDFIELD.—J. K. Turner, consulting engineer of Goldfield, has made a report on the claims of the Merrill Silver Lead Co., 10 miles south of Goldfield. The company was incorporated by several Goldfield mining engineers, including G. H. Duell, formerly chief engineer for the Goldfield Consolidated and one of the engineers who demonstrated the practicability of the 'glory-holing' of the Consolidated mines by the Development company. The Merrill Silver Lead owns 8 claims from which small quantities of ore were shipped by a former owner. The principal vein has an average width of 30 ft. and extends a distance of 1800 ft. through three claims. Little work has been done on the claims. A 20-ft. shaft sunk at the intersection of the main vein and a cross vein has ex-

Photo by Tunc, Goldfield

THE LAGUNA SHAFT, GOLDFIELD, NEVADA

ported that construction of a concentrator will be started early next year.

TULE CANYON.—The Tule Canyon Placer Association, after spending \$6000 in developing under option a group of placer claims at the upper end of the canyon, has discontinued work owing to inability to place the operations on a paying basis. A. I. D'Arcy, organizer of the association, has been in New York practically since work was started in connection with his duties as general manager for the Goldfield Development Co., and the failure of the placer venture is said to have been due largely to his being unable to give it his personal attention. According to members of the association, work may be resumed on return of Mr. D'Arcy if an extension of the option can be secured. The Goldfield-Tule Canyon Placer Mining Co., operating below the association, will reduce the working force to a minimum and continue on a small scale. This is caused by the unusually small flow of water in the canyon at this season and inability to raise funds in southern Nevada during the Tonopah-Divide

posed 4 ft. of ore assaying a trace in gold, 1.40 oz. silver, and 7.40% lead. A sample taken from a 1-ft. width at this point gave an assay return of \$27.70 per ton. The silver is in bromide and chloride form, principally the latter, making the ore slightly refractory. The cross-cut from the 100-ft. winze from the 320-ft. level of the Cracker Jack has been driven 55 ft. toward the vein, which it is estimated should be entered at 80 ft. from the shaft, later surveys having proved the dip to be less than was at first estimated. The gross production of the Florence from July 11, the date on which it was taken over by the new management, to October 2 was \$150,505. Of this sum \$120,695 worth of ore has been settled for by the smelters, and 5 lots, valued at \$29,810, have not been settled for. The production was made entirely by lessees. The last three cars shipped by the Florence Divide lease were valued at \$60, \$112, and \$246 per ton. The Delcie lease shipped a carload assaying \$50 per ton on October 1. Ten lessees are working in the mine. The west cross-cut being driven by the Florence company has

been advanced 200 ft. into the foot-wall of the vein and toward the Columbia mountain fault.

OREGON

PLATINUM IN PLACER MINES.—AN INTERESTING OCCURRENCE IN THE HIGHLAND QUARTZ MINE.

JACKSON AND JOSEPHINE COUNTIES.—But little attention was paid to the production of platinum in southern Oregon until the War. With the interruption of the normal importation from the Ural mountains, the Government made a special effort to discover and develop the deposits in Jackson and Josephine counties. To this end

vine-bearing rocks of the Sierra Nevada and tributary ranges, the source of the platinum has not been traced to lode deposits containing the metal in the native form, nor, except in one instance, have lode deposits been discovered. A roughness of the platinum and in some specimens a black or brownish coating, which is apparently iron oxide, occasionally indicate proximity to a source. In the Riddles Quadrangle the serpentines have resulted chiefly from the decomposition of the peridotites and the pyroxenites, but some areas of the serpentine are probably the result of the decomposition of basic phases of the greenstone.

Many of the miners in prospecting for platinum had

THE OLD CHANNEL PLACER MINE, JOSEPHINE COUNTY, OREGON

L. M. Prindle and H. G. Ferguson, geologists of the U. S. Geological Survey, early in the War spent over three months in an inspection of the region, including practically every hydraulic placer-mining district in southern Oregon and northern California. In nearly every district visited by these geologists they found that, prior to their coming, practically no attention had been paid to the recovery of platinum by the hydraulic miners. The miners had often discarded it without recognition, or, after keeping it some time as a curiosity, threw it away when a ready local market was not available. The geologists, however, found that platinum occurred in small amounts in almost all the placer diggings, and started interested investigations on the amount that it was possible to recover.

Platinum, like chrome in this region, is closely associated with serpentine. It occurs as an alloy of platinum, iridium, and osmium, as in the Ural mountains. Although it is believed that the source of the gold placers, like those of California, was in the serpentine and oli-

difficulty in determining whether or not the black sands of the region contained the metal, and at other times confused it with silver. In some placer deposits the grains of the platinum are coated with a dark film and somewhat resemble the grains of chromite, magnetite, or ilmenite, which in panning was confusing to the miners. During the visit of the geologists to the region, they showed the difference to the miners, and now most of them are able to detect the presence of platinum. The sodium-mercury amalgam is the principal agent used for collecting jointly the gold and platinum.

Late in 1916 the owners of the Highland quartz mine in the Gold Hill district were surprised, on receiving from the smelting company a report of a mill run, to find that the shipment, in addition to the gold and silver contained 0.032 oz. platinum. The ore was mined at a depth of 100 ft. The foot-wall of the vein is mingled schist and granite, and the hanging wall is made up of serpentine, schist, and granite. The Highland claim lies 12 miles south-west of Gold Hill, on the right fork of Foothills creek,

at an elevation of 2600 ft. It was first worked about 20 years ago. The present workings are confined to the oxidized zone; the old workings were more extensive. The vein strikes NE. and dips about 35° SE.; the country rock is a micaceous sandstone. The owners of the mine, in an attempt to discover the source of the platinum found in the shipment, gave the walls of the vein a thorough test by both pan and assay but found no trace of platinum. They then looked to the vein-matter for the source. The vein-matter contains quartz of three colors, rose, amber, and blue. The blue quartz, which is quite dense, is pitted throughout with small cavities, which are lined with a black, sooty mineral, and filled with a decomposed iron matter. In crushing and panning this quartz it gave results high in platinum.

The mine is equipped with a 3-stamp mill, amalgam-plates, and one $4\frac{1}{2}$ by 16-ft. Frue vanner. The ordinary sodium-mercury amalgam was used, which saved the platinum. The field survey of the Oregon bureau of mines was informed of this discovery, which occurred since the former survey in 1916, and while in this district the past summer it intended to make a thorough survey of this deposit. A forest fire, however, swept over the mine before the survey was made, destroying some of the underground work and making it unsafe, so that the work was left for another visit.

The accompanying illustration shows the Old Channel hydraulic placer mine in the Galice district in Josephine county. This is a typical placer mine in southern Oregon; since the investigations on the occurrence of platinum in these gravels its recovery has received careful attention, with the result that mines of this sort are now producing some platinum.

BRITISH COLUMBIA

ACTIVITIES OF THE GEOLOGICAL SURVEY.—MEETING OF THE CANADIAN MINING INSTITUTE.

Survey-parties representing the Geological Survey Branch, Ottawa, have been at work in various parts of British Columbia this summer. Some of them still are in the field, although the season may now be considered practically at an end. There also was a Yukon party under W. E. Cockfield engaged in making an examination of the silver-lead lode deposits of the Mayo country, the results of whose work will be awaited with considerable interest by mining men. Those parties whose activities were confined to the Province may be enumerated as follows: (1) Salmon river, head of Portland canal, in charge of J. J. O'Neill, who was the geologist with the Stefansson Arctic expedition. This is the zone in which is situated the Premier mine and a number of prospects of much promise. It is a district which, at present, is being developed on a large scale, diamond-drilling being under way on the Big Missouri and one or two other groups of claims. Mr. O'Neill's report, therefore, will be looked forward to with more than usual interest. (2) Cariboo country, in charge of B. R. MacKay, who is making a geological survey of the placer gold deposits. (3) Pacific Great Eastern Ry. section, between centres of

Clinton and Quesnel, in charge of L. Reinecke, who is making a special examination and reports on the soda lakes of that area. (4) Slocan, in charge of M. F. Bancroft, who is completing a geological survey of the Slocan district started years ago. This work was almost completed by the late O. E. LeRoy, who went overseas and was killed in France. The late C. W. Drysdale then took up the work but, after getting well on with it, he was drowned in the Kootenai river. His records also were lost. This occurred in 1917. (5) West coast of Vancouver island, by V. Dolmage, who is making a reconnaissance of the coast line. (6) Britannia area, Howe sound, by S. J. Scholfield, who is making a detailed examination and preparing a geological map of the Britannia mineral zone. (7) Bridge River country, by S. C. McCann, who also is carrying on work on which the late Mr. Drysdale was engaged at the time of his death. Mr. McCann is preparing a geological map of the region. He now is visiting the Grass Valley district, California, for the purpose of comparing the geology and the mineralization of the Mother Lode district with that on the survey of which he is employed. (8) Coquihalla River section, by Charles Camsell, who is in general charge of geological survey work in British Columbia and whose headquarters are at Vancouver. Mr. Camsell was able to get into the field for a few weeks in order to make an examination of this country and his report will be available when the complete account of this year's activities in the Province is issued by the Geological Survey Branch, Ottawa.

KIMBERLEY.—The operation of the Sullivan mines of the Canadian Consolidated Mining & Smelting Co. are seriously hampered as a result of a strike of the metalminers, which was declared during the third week in September. Their demand for an increase of \$1 per day in wages was not acceded to and it is estimated that approximately 200 men walked out in protest. The North Star mine, owned by O. C. Thompson and J. L. McKinney, also is affected. This mine was expected to be on a shipping basis again shortly, the work of replacing that part of the plant destroyed by a recent fire having been carried through expeditiously.

VANCOUVER.—The announcement that the annual meeting of the Canadian Mining Institute will be held at Vancouver on November 26, 27, and 28 has been received with gratification by Western mining men. This action is accepted as indicating that the importance of the mining industry of the provinces of Alberta and British Columbia is becoming recognized throughout Canada. E. T. Hodge, professor of geology at the British Columbia University, has been appointed general secretary. He occupied a similar position in connection with the recent International Convention at Vancouver, the success of which was in no small measure due to his energy and intelligent direction. Mr. Hodge and the members of the committee of management already are engaged in the preparation of a program which, it is hoped, will make the first meeting of the C. M. I. held in Vancouver one of the most outstanding in the organization's history.

ALICE ARM.—The Dolly Varden mine is developing better than the diamond-drill operations undertaken by the late owners foreshadowed. Some 1000 tons of ore averaging \$50 per ton already has been shipped, and the railroad is kept busy on the company's own ore. It is said that improvements will be made in the line and rolling stock added so that the company will be able to haul custom ore to tidewater. Extensive development is being pushed at a number of mines, and these will require transportation facilities in the spring, while at the present time several mines are in a position to ship small batches of ore if the necessary transportation were available. The North Star, which is being operated by the Taylor company, is packing sacked ore on horses to the

respect instead of showing improvement has recently become worse. This is partly owing to the competition of the lumber companies, which are paying men as high as \$100 per month with board for work in the logging camps. The Hollinger, which had 1300 men on its payroll a short time since, has now only about 1000, and is only able to operate 100 of its 2000 stamps. The Dome has only approximately 300 men at work, the McIntyre 400, and the Davidson 85. This exhausts the list of the producing mines, many of those formerly operated being closed down for the present owing to the handicaps of labor shortage and the high cost of supplies. The mine managers are hoping that the vocational training of returned soldiers may prove a source of relief.

AN ICE BRIDGE NEAR THE TERMINAL MORAINÉ OF THE LLEWELLYN GLACIER, ATLIN MINING DIVISION, BRITISH COLUMBIA

Dolly Varden railroad. It is expected that \$30,000 will be realized from the shipment. The mine is looking well, the main tunnel being in ore that shows native and ruby silver freely. Mr. Meenach, of Seattle, who recently bonded the Muskateer group, has discovered ore running \$200 in gold and 135 oz. in silver per ton. Price and Crawford, of New York, have bonded the Tiger property, for \$25,000. David J. Hancock, who took over the United Metals earlier in the year, has two 12-horse pack trains transporting ore to tidewater.

ONTARIO

SHORTAGE OF MEN AT PORCUPINE.—COBALT RECOVERING RAPIDLY FROM THE EFFECTS OF THE STRIKE.

PORCUPINE.—The gold mining industry is greatly hampered by labor shortage, and the situation in this

COBALT.—This district has recovered rapidly from the effects of the strike. The majority of the leading mines are operating at full capacity and large shipments of ore and bullion were made for the week ended September 27, the Nipissing sending out 225,557 oz. of bullion and the Mining Corporation 68,603 oz. The lower workings of the Nipissing will be completely dewatered by October 5. The Beaver is taking out considerable high-grade ore from its upper levels. At the La Rose a rich find of high-grade has been made at the 100-ft. level and a good vein of high-grade is being opened on the Princess property. The shaft on the University is being pumped out and driving will be started on a good vein encountered just before the strike. This company is now producing more ore than at any time in the past five years.

ELK LAKE.—There are many indications of a revival in this district. The Paragon-Hitchcock is down to the

200-ft. level and is driving on two faces. Native silver is showing in one of the drifts. Interests represented by Thomas Flynn of the Matachewan have taken an option on the Silver-Alliance and will endeavor to develop the ore-shoots which yielded rich high-grade in the earlier days of the camp. Luke Ryan has disposed of a claim in Smythe township to Chicago purchasers for \$30,000. Other deals with prospective American buyers are in progress.

LARDER LAKE.—The Argonaut Gold Mines has been organized in Montreal to take over La Mine d'Or Huronia, situated near Beaverhouse Lake, and a number of the adjoining claims. The mill installed on the property some years ago has been reconstructed and will be used as a testing plant. John W. Morrison, who was manager of the Lake Shore mine, Kirkland Lake, for some years, has been appointed general superintendent.

GOWGANDA.—A number of new prospects are being developed and machinery installed in some cases. The Northern Mining company's property, which was closed down during the War, is undergoing inspection with a view to resuming development. At the Castle, which is being worked by the Trethewey under option, a new find showing rich ore has been made on the surface. The Camphurn has installed a mining plant brought in from the old Foster mine of Cobalt.

MANITOBA

RAILROAD PROPOSED FROM THE PAS.

COPPER CITY.—The new district which is being established at the mineral field near Copper Lake, north of The Pas, will be known as Copper City. The Manitoba government is anxious to promote the development of this area and is urging the Canadian government to construct a railway from The Pas to the new field, a distance of 72 miles. The matter is under consideration and as a preliminary step J. B. Tyrrell is making an examination of the mineral deposits of the area for the Canadian government to ascertain whether they are of sufficient importance to justify building a railroad. Should the authorities at Ottawa refuse to take action the project may be taken up by the Provincial government.

MEXICO

DEVELOPMENTS AT LAS CHISPAS.—YAQUIS STILL CAUSE TROUBLE IN THE MOCTEZUMA DISTRICT.

LAS CHISPAS.—Antonio Pedrazzini, manager of Las Chispas, has gone to Europe to interview Pedro Pedrazzini, president of the company, relative to improvements in the equipment, considered necessary to maintain production at the present rate. During the last two years Las Chispas has produced 3,500,000 oz. of silver, but owing to deterioration of equipment during long shut-downs, and because the greater part of the ore now blocked out is of lower grade than that formerly worked and of somewhat refractory character, no such output may be maintained in the next two years without extensive overhauling of equipment. Considerable new

milling equipment is planned for by Mr. Pedrazzini if the president and other stockholders resident in France and Switzerland agree. The Babacanora mine, adjoining Las Chispas, operated by F. Oldfield Bostwick and Hoval A. Smith, recently installed a flotation process which is reported to be operating successfully upon the same character of ore as found in Las Chispas. The ore-bodies of this district are said to be largely low-grade with occasional rich pockets. The labor problem of the district, a difficult one a few months ago, is looking much better as there is a surplus in the district at present and no difficulty is experienced in getting trained men to do any sort of mine or mill work.

CANARIO.—The Canario Copper company, a New York corporation, is developing two deposits of low-grade copper ore, averaging 2 and 2½%, respectively. The principal work now is being done on the Lily group, near Nacozari. A large tonnage has been developed already, but James P. Harvey, president and managing director for the company, is counting upon opening a sufficient body to guarantee a supply for a large mill for a considerable number of years before this phase of work has been passed. Fifty men now are employed on the Lily. A wagon road will be built in the immediate future from this group to the Batamote group, four miles away. Two trucks, a two-ton and a half-ton, are operated by the company to freight supplies from Nacozari over the excellent wagon road which has been built. The district in the vicinity of Nacozari has been quiet and law-abiding for a long period, but on September 26 four Mexicans, armed with ropes and knives, attempted to capture Mr. Harvey with the avowed intention of robbing and murdering him. Mr. Harvey was riding alone from the property to Nacozari, but fortunately was armed with a revolver. Alighting from his horse, he placed his back against the abutment of a bridge on the Nacozari railroad near Cuesta Castilla, and fortunately was able to overawe the men without shooting. He forced them to ride ahead of him until they were near Nacozari, when he allowed them to turn off the trail. Going into town he obtained the assistance of Presidente Perraza, who with a file of soldiers took the trail of the four men and soon captured them. At last report the amateur highwaymen, all of whom formerly had been employed by the Canario and who, it was discovered, believed Mr. Harvey had part of the company payroll on his person, still were in jail awaiting trial. Arrivals from the lower end of the Moctezuma district report that although there have been no incursions of Yaquis since the holding up of the San Nicolas and Archipelago mines several weeks ago by a band of 80 Indians, an insidious form of terrorism was created by the raid which has rendered more difficult the already bad labor condition. Although reliable information has been received that after the robbery of the San Nicolas and destruction of the assaying and office equipment of the Archipelago, the Indians rode southward into the Sahuaripa district, every day or two Indian 'scares' visit the small mining camps of the Moctezuma-Cumpas district, distracting attention from work in hand and lowering efficiency to a marked extent.

CALIFORNIA

Alturas.—The Hess Gold Mining Co. is planning to sink a new shaft to a depth of 550 ft. The present shaft, sunk on the site of the original discovery, is only 350 ft. deep. The new shaft will be in a more favorable location.

Auburn.—The Rising Sun Gold Mining Co. is re-opening the Fabled mine in eastern Placer county, under the management of E. C. Klinker. The property produced much gold in pioneer days but has been closed many years through litigation. An electric hoist and other equipment have been installed.

Junction City.—Preliminary work has begun at the Jacob placer mine in the Red Hill district, recently purchased from the Jacob estate by Jafet Lindeberg, Alaskan mine operator. The purchase price was \$22,000, payable within three years, with 20% of the gross output to be paid the estate. The Jacob is well equipped and has produced well.

Portola.—Robert A. Kinzie, superintendent of the Engels Copper Co., has announced that persistence of the main sulphide orebody in the Engels mine has been demonstrated to a depth of fully 560 ft. below the lowest developed point, a total depth of 1000 ft., by diamond-drilling. The company has decided to consolidate the two reduction plants to lessen operating costs, with the mill to be at the lower camp. The ore is being mined by the shrinkage system.

Sonora.—National Gold Mines, operating National quartz mine near Priest's station, has decided on the erection of a 10-stamp mill, hoist, and other equipment. Jesse Mangante of Sonora is resident agent and William Treton, superintendent. The vein has been opened by a 250-ft. tunnel and ranges from 3 to 21 ft. wide. A shaft is to be sunk near the face of the adit to open vein at depth.

Weaverville.—The Globe mine near Dedrick has been sold by the Globe Mining Co. to the Bulkeley Wells interests. The new owners have eight men at work under the superintendence of Roy H. Elliott. The Globe is about the highest quartz mine in the State, and it has lain idle for two years.

NEVADA

Mina.—P. A. Simon, president of the Simon Silver Lead Mines Co., announces that Burch, Hershey & White have accepted the position of consulting and directing engineers for his property at Mina. Mr. Hershey has already visited the mine, and outlined a course of development which augurs well for the future of the property. M. W. Hayward, of the American Metals Co., spent several days in Mina last week in the interests of his company. He inspected a number of mines in the Simon district, and expressed himself as being much interested, particularly in the Simon Silver Lead and the Simon Fagan. F. W. Royer of Los Angeles was in Mina for a short time last week, and promises a return visit soon. A. H. Elftman of Tonopah was in the district last week in the interests of a group of San Francisco capitalists, who are said to contemplate large operations here. Mr. Elftman inspected and sampled several properties while here, among them the old Pactolus mine, now the property of the Tonopah-Shawmut Co., the Loo mine, and the Olympic. His report on these properties is awaited with much interest.

National.—High-grade gold-silver ore has been opened on the Buckskin National by a lease operated by Forrest Eell and Chris Choats.

Wellington.—A 40-ft. vein carrying gold and silver ore has been uncovered on the Klondike, owned by J. J. Herndon and S. O. Dykes. Rich seams occur mixed with the low-grade.

IDAHO

Coeur d'Alene.—The Silver Dale & Big Hill Mining Co. has issued a favorable report, foreshadowing a resumption of operations when the water supply improves.—The Sterling Silver Mountain Mining Co. has resumed operations on its property on Big Creek.—An extensive program of development has been outlined for the Linfor Copper Co.'s holdings.

Pioneerville.—The Golden Age Junior Mining Co. is shipping its seventh car of concentrate and is preparing to drive an adit to open the mine.

MONTANA

Iron Mountain.—The Intermountain Copper Mining Co., having a property near Iron Mountain, resumed operations recently and has been proceeding steadily since on a one-shift basis, according to Edward Evans, president. "A carload of concentrate and two carloads of crude ore have been shipped since the latter part of August," said Mr. Evans. "The crude ore was obtained in cleaning out the bins and an old stope. A carload of it had a copper content of 13%, but the content of the other car was not so high."

UTAH

Salt Lake City.—With a view to bringing employer and employee closer together in the present revolutionary state of world affairs, R. C. Gemmell, general manager for the Utah Copper Co., has given out a statement made to his men as follows:

"With the object of maintaining the present pleasant relations existing between the management and the employees, the Utah Copper Co. invites the employees to select a representative committee to consult with the managing and superintending officials on subjects of mutual interest. Although we are proposing that the men deal with the officials through elected committees, nevertheless I wish to state that the offices of the company officials will continue to remain open to all employees for the discussion of any and all subjects of mutual interest. In September ballots will be furnished at the time office for the election of an employees' committee to consist of three members from each division. Each employee will vote, by ballot, for three members in his division. The ballots will be deposited in a ballot box in the time office, and the employees will be requested to select a committee of three to act jointly with a similar committee appointed by the management to supervise the election and count the ballots. Only employees shall have the right to vote. No official of the company, foreman, nor any person having the right to employ, remove, or discharge an employee shall be entitled to vote. The three candidates in each department receiving the highest number of votes will be declared elected."

WASHINGTON

Loon Lake.—Mining claims in this district have been upheld against the rights of a homesteader. The decision affects valuable mining property.

Loomis.—New York interests headed by Charles Dempster have leased properties of the Copper World Gold Mining Co. six miles from Loomis. It is reported that they will spend \$25,000 within a year in development and equipment. The same interests own an adjoining property and shipped 4000 tons of ore in 1918.

Northport.—An ore chimney of value has been discovered on the Gladstone property in the Northport district. The property will ship in the spring.—Ore has been discovered in a new place on the Electric Point property near Northport.

Oroville.—Arkins and Grant, lessees of a property and stamp-mill near Oroville, are shipping their first car of concentrate. A valuable discovery is reported on the Alice claim adjoining.

BRITISH COLUMBIA

Woodbury Creek.—Operation of the Highland concentrator of the Consolidated Mining & Smelting Co. has been resumed after a suspension of seven months. Development was continued in the period of milling inactivity. The purchase of adjoining properties has increased the Highland group to seven claims.

PHILIPPINE ISLANDS

Benguet.—The Benguet Consolidated Mining Co. treated for the first half of the current year 8550 tons of ore with an average gold content of \$25.70 per ton. The recovery was 92.4%, a total of \$209,331, or \$24.47 per ton. Operating expenses were \$9.45 per ton, leaving a profit of \$13.50 per ton. Dividends amounting to \$75,000 were paid. Operations were greatly hampered by lack of men during the spring months, with consequent low tonnage and high costs per ton.

Personal

The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

Hallet R. Robbins is in New York.

W. de L. Benedict returned to New York by way of Los Angeles.

Graham Cruickshank has returned from France to Rossland, B. C.

Louis A. Wright has sailed from New York for Rome, on his return to Italy.

S. H. Dolbear has returned from an inspection near Downieville, California.

F. W. Bradley is expected in San Francisco, from Alaska, toward the end of October.

William A. Argall, of Denver, has joined the staff of the Alaska Gold Mines, at Juneau.

Austin F. Rogers has returned to Stanford University from a geological trip to Siskiyou county.

S. J. Speak, of the firm of Hooper & Speak, London, has arrived in New York on a tour to the zinc-reduction plants of this country.

J. F. Mitchell-Roberts has resigned as assistant manager of the Suan Concession and is now on his way from Korea to San Francisco.

William Motherwell has returned from Mysore, in India, to San Francisco, having spent four months on the way, owing to the disorganization of shipping.

Urie Brown, James W. Gwynn, Cy. Garber, and Lester Benson have returned to Kellogg, Idaho, from Council, Alaska, after investigating the Omilak prospects.

Julius M. Cohen returned from France in command of the 319th Engineers. Major Cohen was Chief Engineer of Construction, and Camp Engineer for the past year at Camp Pontanezen, near Brest.

The accompanying photograph will interest our readers. It represents the judge, the lawyers, and the geologists that took part in the recent Elm Orlu v. Butte & Superior lawsuit. In the background is the Federal Building, at Butte, where the case was tried. The top row, from left to right, shows W. H. Emmons, W. B. Fisher, Fred Searls, Jr., John Templeman, W. A. Clark, Jr., Will Rossberg, Rush White, and Walter Lytzen. The bottom row consists of William Scallon, Albert Burch, Walter H. Wiley, Darcy Bard, Horace V. Winchell, George M. Bourquin (the Judge), James F. Kemp, W. K. Leith, John Gray, J. B. Kremer, Sidney Sannet, William Wallace.

EASTERN METAL MARKET

(By wire from New York)

Oct. 7.—Copper is inactive and easy. Lead is dull but firmer. Zinc is quiet and stronger.

SILVER

Below are given official or ticker quotations, in cents per ounce of silver 999 fine. From April 23, 1918, the United States government paid \$1 per ounce for all silver purchased by it, fixing a maximum of \$1.01½ on August 15, 1918, and will continue to pay \$1 until the quantity specified under the Act is purchased, probably extending over several years. On May 5, 1919, all restrictions on the metal were removed, resulting in fluctuations. During the restricted period, the British government fixed the maximum price five times, the last being on March 25, 1919, on account of the low rate of sterling exchange, but removed all restrictions on May 10. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the normal rate of exchange.

FOREIGN EXCHANGE

Continental rates weakened somewhat during the week, in contrast to sterling, which recorded a slight net advance. Nevertheless the tone of the market remains decidedly uncertain, with predictions still confident in some quarters that much lower levels may yet be seen before the current turns permanently upward. Speculation also continues to be more than to the usual extent a factor in exchange markets. As regards such interest in German marks the point is made that considerable uncertainty may arise in regard to buying of checks on Germany, which are simply orders of banks here to effect payment in Germany, and may not prove permanently valid. One of the largest German banks is said to have served notice that the time between issue and presentation of checks issued in America and payable in Germany may not exceed two months.

In a recent speech on industrial conditions in Europe as they affect the need for credit and raw materials, George E. Roberts, vice-president of the National City Bank of New York, said in part:

"The War has touched us lightly. We are a richer people than when it began, with greater productive capacity. Our wealth and productive capacity are one-third to one-half that of the world. We have what Europe needs to restore her industries. We have the financial ability to give relief. We were a debtor nation before the War, we came out a creditor nation. We have bought back American securities held in Europe at very low prices, by selling war materials and foodstuffs at very high prices, and they are heavily in debt to us besides.

"There are only three ways in which international payments can be made: First, in commodities of trade, but Europe is unable to pay in these; she needs to import them. Second, in gold, but they have no gold they can afford to spare. We have just received \$158,000,000 gold from Germany for food. That must have been nearly half all she had, and I am sorry some other settlement was not found. We don't need that gold; we have too much now, and Germany does need it, as basis of credit and industrial life. Gold will merely inflate our credits and prices still further. The third means of payment is by promises to pay in future, and this is the only way our export trade to Europe can go on.

"Before we entered the War we received over a billion in gold from Europe, but after we entered our Government began to make loans to allied governments, to furnish the means of making purchases here. Congress set the limit at \$10,000,000,000, and something over \$9,600,000,000 has been loaned, over \$2,000,000,000 since the armistice. Power to make these loans is nearly exhausted, and other means of supplying credit must be found or our exports will fall off.

"Allied governments have abandoned efforts to stabilize exchange, and the decline increases cost of American goods. Discount on the pound is 15% on the franc over 40% on Italian money over 50%. We think prices high, but how can the French pay them, and pay high transportation charges and 40% on top for exchange? Italy produces no coal or oil or steel or cotton; how can she buy them at such cost? Coal is over \$100 per ton in Italy, and little is to be had. Before the War Italy and France imported coal from Great Britain, but British production has declined until there is little to spare. America is the only resource."

Quotations on October 7 are as follows:

| | | |
|-----------|--------|------|
| Sterling: | Cable | 4.22 |
| | Demand | 4.21 |
| Francs: | Cable | 8.34 |
| | Demand | 8.36 |
| Lire: | Demand | 9.72 |
| Marks | | 4.40 |

Eastern Metal Market

New York, October 1.

The steel strike has been and still is interfering with business in all the non-ferrous markets. This is particularly true of tin.

Demand for copper is light and the price tendency is easy. Quotations vary as to the sales involved as well as the quantity.

Spot tin is firmer but demand in general is slow.

The lead market is quiet, but quotations are in the main firm but slightly changed.

Prime Western zinc is lower with few sales reported.

IRON AND STEEL

The steel strike has entered its second week and it can be safely stated that the advantage is with the employers. In most districts where the effect was the worst many men have returned to work or are gradually doing so. A tie-up of the entire industry has failed. A serious attempt, well organized, to close up all the plants of the Bethlehem Steel Corporation on Monday failed miserably. Counter claims are given out by both sides but it seems assured that not one of this corporation's plants, which are situated in six or eight different and widely located cities, has been seriously if at all affected. In the meantime, business in general is held up. Although some orders are being taken the disposition is to wait until the skies clear. A strike of pressmen and feeders in the New York district was started September 30, one day ahead of the schedule. This has thus far seriously interfered with the publication of all trade papers in the city. What the outcome will be is not known. Some papers, like 'The Iron Age', will issue special market editions.

COPPER

The market is in a unusually chaotic condition as to prices and a fair appraisal is difficult. It appears that the leading or large producers continue to maintain their quotations at 23.50c., New York, for both electrolytic and Lake copper for October and last quarter delivery, but that they are doing practically no business. Another set of sellers, presumably smaller producers and some speculators, are quoting about 22.50c. for the spot and early delivery, while less influential sellers are prepared to sell at as low as 21.50 to 21.75c., New York, for spot and October delivery. Just how much business is being done is uncertain. There are reports that considerable quantities have been sold at the last two levels. Demand, however, on the surface does not seem to be of consequence and the market is a quiet and waiting one, due of course to the steel strike and other adverse labor conditions. Sales of some magnitude are reported to certain foreign consumers, chiefly France and Scandinavian countries, but the labor troubles in England and the consequent uncertain shipping situation are now holding up further sales.

LEAD

Extreme dullness pervades the market. There are offerings of outside lots as low as 6c., New York, but these are limited. Most of them are easily absorbed. It is difficult to quote the market satisfactorily in present circumstances, but a fair appraisal seems to be 6.05c., New York, for October delivery with St. Louis as a base at 5.85 to 5.95c. The American Smelting & Refining Co. has not changed its quotations of 6.25c., New York and 6c., St. Louis.

TIN

It is generally conceded that the steel strike has affected the tin market to a greater extent than any other. A little

business has been done in both the spot and future shipment markets, but in general dullness rules. The spot market is a little stronger, due to the belief on the part of some that shipments from England will be interfered with because of the railroad strikes there. This is taken to apply both to Straits tin and to Lamb & Flagg. Yesterday spot Straits was selling at 55c., New York, as against 54.75c. the first of the week and late last week, and the tendency is upward. There is also a fair demand for tin actually afloat and sales of this have been made at from 54.25 to 54.70c. on such lots due to arrive in from two to ten days. There has also been a little business done in October-November shipment from the East at 53 to 53.25c. But until the steel strike is settled an active demand is not likely. The arrivals are wholly sufficient to meet present demands. Up to the latest advices these have amounted to 5120 tons for September of which 3695 tons has come in at Atlantic ports. The quantity afloat is put at 5130 tons. American pure tin is quoted at 54.62½c. and 99% pure at 53.75c. The London market was stronger yesterday at £275 10s. for Straits. The average quotation of tin for September was 55.79c., New York.

ZINC

There is no improvement in the situation and the market continues inactive and weaker. Prime Western for October delivery is not obtainable and has sold at 7c., St. Louis, or 7.35c., New York, which is quoted as the market. Later month's delivery is held at about five points per month above the October level. The steel strike is a particularly depressing factor for no galvanizers are eager to buy zinc under such conditions. The railroad strike in England is another adverse factor in that American bottoms have been ordered not to sail to England and this hinders what little export trade was going. This latter factor has its influence also in the copper market. In all departments of the zinc-market buyers and sellers are indifferent and not anxious to do any business under present conditions. The figures of the U. S. Geological Survey, recently published, are taken to indicate an over-production of zinc considering the needs of the recent past. About 43% of the 445,000 tons produced in 1917 was used in galvanizing.

ANTIMONY

The market is quiet and but few sales are reported. Wholesale lots for October delivery are quoted at 8.50 to 8.62½c., New York, duty paid.

ALUMINUM

No. 1 virgin metal, 98 to 99% pure, is unchanged at 32 to 33c., New York, for wholesale lots for early or October delivery.

ORES

Tungsten: The market is quiet and demand light. Quotations are more or less nominal at \$7 to \$10 for wolframite and scheelite with Chinese ore at \$7.25 and Bolivian ore at \$9 to \$10 per unit in 60% concentrates. Ferro-tungsten can be obtained at about \$1.15 per lb. of contained tungsten.

Molybdenum: Quotations are nominal at 75 to 85c. per lb. of MoS₂ in 90% concentrates.

Manganese-Iron Alloys: Because of the steel strikes business in ferro-manganese and spiegeleisen is very light. American producers of ferro-manganese, 80%, continue to quote \$110, delivered. The Boston representatives here either quote \$105 to \$110, seaboard, or do not quote at all. Spiegeleisen is quiet but firm at \$35, furnace.

Book Reviews

Chemical Calculation Tables. By Horace L. Wells. Pp. 43. John Wiley & Sons, Inc., New York. For sale by 'Mining and Scientific Press'. Price, \$1.25.

The principal tables in this book give, respectively, atomic weights, gravimetric factors, atomic weights for the more common chemical formulas, reduction of gas-volumes to 0 and 760 mm., barometric corrections for temperature, multipliers for organic compounds, weights and measures, and logarithms. The book will be useful to the chemist and the chemical engineer.

Steam-Engine Troubles. By H. Hamkens. Pp. 267, ill., index. The Norman W. Henley Publishing Co., New York. For sale by 'Mining and Scientific Press'. Price, \$2.50.

This is a practical book for the operating engineer written in non-technical language so that anyone with enough intelligence and experience to run a steam-engine can understand it. Chapters are devoted to the various parts of the steam-engine and the possible troubles that may develop, also to such special subjects as foundations, erecting, valve-setting, and operation. The book is illustrated with nearly 300 small line-drawings. It will be of value to anyone who runs a steam-engine or has one run for him.

Directory of the American Association of Engineers. Pp. 190. Ill. American Association of Engineers, Chicago.

The Association is now three years old and has approximately 2200 members, mostly civil engineers, but a number from the other branches. Besides the material usually found in a society year-book there is a directory showing the condensed experience of each member. This is, presumably, mainly with the idea of presenting information in tabulated form to prospective employers. However, unlike most society year-books, addresses are given without information as to the position the member at present holds. This omission is the more remarkable because an employer is frequently more interested in what a man is actually doing than in what he has done.

Astronomy for Surveyors. By R. W. Chapman. Pp. 241, ill., index. J. B. Lippincott Co., Philadelphia. For sale by 'Mining and Scientific Press'. Price, \$1.75.

This book is a sort of happy medium between the brief treatment of astronomical theory found in most textbooks on surveying and the highly technical discussion in an astronomical treatise. The first chapter contains a brief review of the principal propositions of spherical trigonometry. Several chapters are then devoted to discussion of theory, which is then applied to the practical problems of determination of the true meridian, of time, of latitude, and of longitude. The book will be of value both to students and to practical surveyors who realize, as most of them should, that their knowledge of the astronomical basis for their work is entirely too limited.

Oxy-Acetylene Welding Manual. By Lorn Campbell. Pp. 148, ill., index. John Wiley & Sons, Inc., New York. For sale by 'Mining and Scientific Press'. Price, \$1.25.

This book is intended as a manual for the practical welder, in fact, if anything, it errs too much on the side of the elimination of theory. However, the man that wishes to study the theoretical side of welding can find it discussed in other books. The present volume, after a brief introduction describing the principal uses of oxy-acetylene welding, discusses the apparatus and shop equipment and the general methods of operating the same. Most of the rest of the

book is devoted to the special problems in connection with the various metals most commonly welded, including cast-iron, malleable iron, steel, brass, and aluminum. Another chapter considers the use of the oxy-acetylene torch in cutting metals, and there is also a chapter on the oxygen process for burning carbon from cylinders of internal combustion engines. The book appears to have been hastily written, and there are many sentences that could have been made less obscure by a little careful editing. However, it will be useful both to the practical welder and to the man learning the trade.

Applied Mechanics. By Charles E. Fuller and William A. Johnston. Volume II—Strength of Materials. Pp. 538, ill., index. John Wiley & Sons, Inc., New York. For sale by 'Mining and Scientific Press'. Price, \$3.75.

This is a text-book prepared by two members of the faculty of the Massachusetts Institute of Technology. It is a good text-book, and makes no claim to be anything else. The mathematical discussion of the various principles involved is complete, and it is illustrated at the end of nearly every chapter by a number of problems. The student may, however, be disappointed to find that few of them are worked out for him, neither are there any 'answers' in the back of the book. The scope may be judged from the chapter headings, which are Physical Properties of Materials, Analysis of Stress and Strain, Uniform Stress and Uniformly Varying Stress, Stresses in Beams, Deflection of Beams, Continuous Beams, Combined Stresses, General Theory of Flexure, Columns, Shafting and Springs, Curved Bars, and Reinforced Concrete Beams and Columns.

INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

THE WELLMAN GEARED BUCKET

Throughout the entire field of handling bulk materials such as coal, sand, gravel, and cinders, the use of clam-shell buckets has been attended by expense and serious delays necessitated by the renewal of operating cables or chains. The ordinary construction of a clam-shell bucket is such that a large quantity of the material handled comes in contact with the operating parts, with the inevitable result of excessive wear, due to the abrasive action of the material and consequent delay and expense in removing and renewing the worn parts.

With the idea of eliminating these faults, the Wellman-Seaver-Morgan Co. has developed a bucket built in accord-

with its longitudinal centre-line. These two sections are bolted together to form two tight compartments enclosing the operating gears, and a third compartment in the centre for the power-wheel and the deflecting sheaves for the operating ropes. The power-wheel centre is integral with the two bevel-pinions, which extend into the gear compartments and mesh with the operating segments. These segments are keyed to the operating shafts which are supported in bearings cast in the casing. The outer end of the operating shafts are finished square and support the rear bucket arms, which in turn are connected to the shell shafts. The cutting edges of the shells are pin-connected to the side bars, suspended from lugs in the top part of the casing. This

method of supporting the shells produces a flat cutting path and turns the shells in such a manner that in penetrating the material, only the thin edge of the shell is presented, resulting in a high digging efficiency.

The excessively wide opening of the shells enables the bucket to fill in material which would otherwise be too shallow. The shells are open at the back to prevent compression of the material when the bucket is closing. The rigid connection of the rear arms to the operating shafts and to the shell shafts ensures positive alignment of the shells; and side lash is further prevented by side-bar guides attached to the shells. It is very important, when handling fine dry materials, that the shells shall register accurately when the bucket is closed. As the operating gears are completely enclosed by the casing, it is impossible for them to come in contact with the material the bucket is handling. On this account complete lubrication is possible and the wear

of the parts is reduced to a minimum, at the same time the efficiency is materially increased.

A power wheel being directly connected to the pinions, the digging effort is the same from the beginning to the end of the closing operation. The opening of the bucket is effected by an opening rope attached to the small section of the power wheel, and wound in the opposite direction from the closing rope. In this way the bucket is opened for power, quickly and completely. On account of the small diameter of the closing pinions the bucket requires a very small amount of rope either for opening or closing, and is capable of high speed of operation.

The bucket is compact in design, requiring a minimum amount of head room for its operation. When open only a small part of the casing extends above the shells, resulting in remarkable stability on the pile, and little tendency to upset. The rope arrangement is such that the bucket is well balanced at all times, whether in the open or closed position.

The Wellman Geared Bucket

ance with approved mechanical principles, possessing highly efficient digging qualities, minimum head-room, and a low centre of gravity, combined with neat appearance and durability. All the working parts are completely enclosed in a tight casing where they are constantly lubricated and where they do not come in contact with the material being handled. The bucket is composed of a minimum number of parts, so arranged as to facilitate the removal of any part in case of necessary repairs. It has no expensive chains or ropes reeved on small sheaves, no complicated parts or difficult adjustments. It is simple, compact, and efficient and is especially designed for handling coal, sand, gravel, and cinders. It is operated by two ropes and, consequently, can be handled by practically any type of two-drum hoist.

Departing from the usual design of grab-buckets, which employ ropes or chains for their operation, this bucket has completely enclosed gearing to produce the necessary digging power. The power-casing, which forms the main frame, and from which the shells are suspended, is divided in a ver-

Established May 24, 1860, as The Scientific Press; name changed October 20 of the same year to Mining and Scientific Press.

Entered at the San Francisco post-office as second-class matter. Cable address: Pertusola.

Branch Offices—Chicago, 600 Fisher Bldg.; New York, 3514 Woolworth Bldg.; London, 724 Salisbury House, E.C.

Price, 15 cents per copy. Annual subscription, payable in advance: United States and Mexico, \$4; Canada, \$5; other countries in postal union, 25s. or \$6.

MASSCO
ORE FEEDER

MARCY MILL

WILFLEY
TABLE

Equipment for a complete mill of ANY size—

From the primary crusher right down the line to the sacks in which you ship your concentrate you can use *Massco Mill Equipment* and save expense at the same time you increase efficiency. A few *Massco* mill devices are illustrated.

MASSCO ORE FEEDER—made in either floor or suspended type. Sturdy and constructed after the most improved design. Adds years to the life of any machine.

THE MARCY MILL—crushing in one easy step is making remarkable records for capacity and low tonnage costs. The reason lies in the Marcy grate and Marcy lifter liners which make possible a rapid change of mill-content and a correspondingly high efficiency and great capacity.

THE WILFLEY TABLE—for more than 20 years the Wilfley table has stood for large capacity and high percentage of extraction. Modern improvements keep the Wilfley in the forefront of all concentrators. The Wilfley was the first successful concentrator—it is still the best.

THE SCOBEY SAMPLER—reduces a full day's run of pulp at any part of your mill, to a 10-lb. sample, accurately and without attention. The Scobey is thoroughly practical and is a most efficient device.

PERFECTION OIL AND ACID FEEDER—a *Massco* specialty for eliminating all doubt from the question of the proper amount of reagent being fed to your flotation machines. Feed is constant and affords a great saving in oil.

SACKETT SAND PUMP—designed by men who know from practical experience just what the demands upon a sand pump really are. The Sackett has large capacity and operates with minimum power consumption.

PIERCE AMALGAMATOR—saves ALL the flour and rusty gold. It is simple, compact and inexpensive. Has been successful the world over. Can readily be taken apart for a clean-up.

When you are in the market for ANY equipment for the mine, mill or smelter remember the *Massco* line. Our engineers gladly cooperate. Bulletins on any of the above devices mailed upon request.

EL PASO

NEW YORK OFFICE, 42 BROADWAY

SALES of copper during the past two months have been insignificant, it is reported, in contrast with the previous two months, but domestic consumption has expanded so cheerfully as to warrant the expectation of another buying movement soon. Europe's purchases have been small, being checked by the delay in the ratification of the Treaty of Peace and by the consequent lack of credit facilities. Japan and China are expected to come into the market as soon as existing political problems have been straightened out. The whole world needs copper and must buy most of it in this country.

OUR sympathies go to the technical press of New York, more particularly the 'Engineering and Mining Journal' and 'The Iron Age', because the strike of the local printing trades has forced a suspension of publication. More than two hundred other periodicals are similarly victimized by a strike that involves a breach of agreement and that has been outlawed by the American Federation of Labor. The charters of the local press-men and press-feeders in New York have been revoked or suspended by their respective international unions; their strike is against the best interests of labor and antagonizes public opinion flagrantly.

LUDENDORFF'S story of the Great War, as published in a number of papers in this country, has now come to an end. We have read it patiently, and we are glad it is finished. Two of the leading generals, French and Ludendorff, have now published their memoirs in a hurry, and neither has added to his reputation thereby. General Ludendorff exhibits the German ignorance of foreign opinion and the German obtuseness to the feelings of others. He dilates upon the hideous nightmare that proved the sequel of the German dream of world domination, but he assumes a complacent pose and blames it all upon the Socialists. History will pin him to his responsibility, the responsibility that he shares with the military clique, which fed the German people with ideas of conquest, ideas that in their conceit they swallowed eagerly, and as noisily as they dispatch their soup. In his description of the events of the War he tries to ignore the American participation and he belittles the performances of the American army, while making a shifty acknowledgment of the successive defeats administered to the German armies by the Allies before he and his friends did the 'kamerad' act in order to escape the consequences of their military collapse. Then they

washed their hands of the whole affair and bewailed the collapse of the German spirit. It is a sorry spectacle, and Ludendorff has not given any dignity to it. His old chief, Von Hindenburg, has shown much better sense by abstaining from false heroics and by accepting the new regime.

WITH keen pleasure we are able to announce that Mr. Hoover has consented to accept the nomination to the presidency of the American Institute of Mining and Metallurgical Engineers. His election to the recognized leadership of the mining profession will be timely and appropriate, doing honor alike to the Institute and to the most distinguished mining engineer of this generation. Mr. Hoover was the guest of the engineers of San Francisco at a dinner on October 7, when he was welcomed and acclaimed by 350 members of his own profession. Mr. T. A. Rickard presided and made a short introductory speech, emphasizing the conclusion that today the economic factor is supreme and that the guest of the occasion was the supreme exponent of it. Mr. Hoover was kind enough not only to make a speech on economic conditions in Europe but to answer a number of questions put to him from the audience. These replies took the form of short supplementary speeches in which he threw light upon several of the darkest phases of contemporary history. The evening was one that will long be remembered. By Mr. Hoover's request, his speech was not reported, otherwise we would have taken pains to put it in print.

IT is satisfactory to note that the railway-men's strike in England has been settled by a compromise that means the defeat of the radical element. There was one incident of the strike that calls for comment, and that was the threat of the compositors employed on the daily newspapers in London to strike if the editorial comment continued to be unfriendly to the strikers. The threat was not made good and it is probable that the ending of the strike prevented any attempt to put it into effect, but it is worthy of record as evincing a spirit worthy of the worst forms of autocratic power, such as liberal men everywhere have learned to abhor. If either party to an industrial quarrel is going to beat the organs of public opinion into servile submission to their view of the quarrel, if independent utterance in the press is to be suppressed, and if the dominant party is to dictate the utterances of editors, we shall have lost at least a century of

progress and we might as well be under the heel of a czar or a kaiser. Even the threat of such a step is mean and cowardly; it shows such lack of confidence in the rightness of their cause that we cannot wonder that the strikers were defeated.

MR. GRATON'S paper on the Federal taxation of mines is concluded in this issue. We have given a full abstract of it in two successive issues because it is a subject of immediate interest, not only to the tax-paying corporation but to the mining engineer engaged in the ordinary valuation of mines. Any rational scheme of taxation should be based upon the principles applied to the appraisal of mines for sale or purchase. For this reason Mr. Graton's paper is of double significance. In the first part he discusses the objects and methods of taxation for revenue, and shows how the regulations established by the Commissioner of Internal Revenue have been inspired by an increasing regard for fairness and equity as between the Government and the citizen. He informs us that his paper was written with the cognizance of the Revenue Bureau and for the purpose of eliciting the co-operation of the mining profession in drafting a technically correct and a politically equitable system of taxation on mining property. Thereupon he himself outlines the problems of mining economics as they affect the matter in hand, more particularly the large risk inherent in mining enterprise and the limitation of the supply of raw material upon which it depends for a profit. It is an industry of adventure on the one hand and of wasting assets on the other. Mr. Graton gives a summary of the successive tax enactments, emphasizing the steadily increasing rate of the taxes on income and excess profit. In the second part of his paper he goes to the roots of the problem and carefully analyzes the method of appraisal that is based upon the determination of the present value of eventual earnings. He refers to the writings of Messrs. H. C. Hoover, J. R. Finlay, and other mining engineers. This present-value method is not directly applicable to all mines; in order to apply it fairly it is necessary to introduce modifying factors, which Mr. Graton describes and discusses. Another difficult item is depletion, which can be estimated correctly only by aid of the experience gained in actual mining. We shall be glad to publish criticism or comment on this important paper.

THE New York 'World', like other newspapers, had its traditions enriched by the service given by sundry members of its staff in the War. Very properly, it decided to commemorate the fallen by means of a graceful and appropriate tablet. On this tablet appears the motto '*Pro Patria et Arma*'. In years to come the student will scratch his head in doubt whether the language be Latin or Esperanto, and when he concludes that it must be meant for Latin, he will wonder how it happened. However, instead of the correct form, *armis*, the editor of the 'World'—no, it could not be he; so let us say the office-boy—might have substituted *mundo*, just for local color-

ing, as it were. How this blunder would have shocked Joseph Pulitzer, who made the 'World' an influential newspaper and used to watch over its editorial columns with catlike keenness even after he became a blind neurotic and had to live abroad. In the 'Reminiscences' by one of his secretaries, Mr. Alleyne Ireland, it is related how he set large store on accuracy. "What a newspaper needs in its news," he said, "in its headlines, and on its editorial page is terseness, humor, descriptive power, satire, originality, good literary style, clever condensation, and accuracy, accuracy, accuracy!" His chronicler remarks that "Mr. Pulitzer made this confession with the warmth generated by an unshakable faith." This reminds one of the definition of 'faith' as believing things one knows to be untrue, for the 'World', as Pulitzer made it, was the first exponent of the yellow journalism that Hearst has developed to a pestilential nuisance. We may admire Pulitzer for his indomitable energy, which was hardly abated even by blindness, but we shall not forgive him for starting the prostitution of the American newspaper. A Hungarian Jew, he came to the United States when only sixteen, without friends, without money, and unable to speak a word of English. When 36 years old he had made enough money from the St. Louis 'Dispatch' to be able to purchase the 'World' from Jay Gould. Starting with a circulation of 12,000, he built up the 'World' until it had a circulation of 200,000 per day. He did this in four years of intensive effort, which put the 'World' in the front rank of the New York press and left him a complete nervous wreck, with the knowledge that his failing eyesight would in a few years develop into total blindness. Yet he continued to direct the management and policy of the 'World' until he died, in 1911. His life was a tragedy and the thing he did, much as he prided himself on having done it, was tragic also.

To Young Engineers

Good health is a decisive element in human happiness, as most men and women discover by experience sooner or later. Therefore we believe that we could do no better service to the young men of our profession than in publishing the text of Dr. Thomas Darlington's address on 'The Relation of Health to Work', which will be found in this issue. It has appeared in other publications, but that does not deter us from printing it again. We believe that it affords some of the most useful advice ever proffered by a physician and we feel confident that no intelligent human being can read it without deriving definite assistance from it in the protection of his health. The young look upon health as normal and do not bother about precautions so long as they are perfectly well; even if they trespass upon their strength or risk the consequences of impairing their physical faculties, they are not punished for it at first, because youth is the great healer and rectifier, but as they grow older they pay inexorably for their carelessness. With all the sincerity of which we are capable and with all the emphasis that written words will permit, we ask every young engineer

to turn to Dr. Darlington's address and to read, mark, learn, and inwardly digest it. If he does, he will have permitted us to do him a service for which he will ever be grateful.

Mr. Hoover and Public Service

On another page we give the complete text of the speech delivered by Mr. Hoover on the subject of the Treaty of Peace and the League of Nations. This speech was made before the Assembly of Stanford University and was transmitted, through the agency of the Associated Press, to the principal newspapers of this country. Whereas the leading Eastern papers printed it in full, our four San Franciscan papers gave only parts of it. The 'Examiner' placed a Senator Johnson head-line over the portion of Mr. Hoover's speech that it printed. The gentlemen editing our local papers ought to go to some school of journalism and learn the A B C of their craft; it is difficult to imagine anything more interesting at this time than a speech by the man of the hour upon the great topic of the hour. At any rate, we are glad to give our readers Mr. Hoover's speech in its entirety. We feel sure that it will be read by them with a keen and personal interest. Mr. Hoover is not a politician, therefore he does not view the subject from a parochial standpoint; he knows its bearing upon the future of the world and upon the welfare of the United States as a member of the comity of nations. His treatment of the subject is quiet and earnest; he speaks with full knowledge and deep conviction; the clap-trap of the half-informed politician is foreign to his style. We shall not take it upon ourselves to emphasize the points he makes, for they are accentuated with admirable clearness; rather we venture to turn to the subject of Mr. Hoover himself.

In San Francisco, as in New York, thoughtful men are asking one another how Herbert Hoover's remarkable ability and extraordinary experience may be utilized for the Nation. The mining engineer who was economic dictator of Europe is equipped for the biggest work to be done in the world today. His previous acquaintance with foreign countries has been supplemented by a unique opportunity to study the political and economic conditions of the European countries from top to bottom. He can think internationally, without abating one jot of his own nationalism, better than any man in the United States, not excepting even the President. To his sturdy Americanism he adds a knowledge of international affairs that is of immense value at this juncture when the United States finds herself impelled to assume the leading part allotted to her by the logic of events, by circumstance and by destiny. During the last two weeks he has addressed all the principal clubs in San Francisco, as well as other representative gatherings, and on each occasion he has created a deep impression, not by oratory, which he does not affect, but by a plain talk saturated with a knowledge of world affairs, more particularly the economic conditions in Europe and the impact of these conditions upon the political development of the countries devastated by war. He realizes fully and deeply, as

a man of powerful mind and right conscience, what part the United States can take and ought to take in the readjustment of the great tangle that confronts mankind today. His audiences have been tremendously impressed as much by his unaffected sincerity as by his evident mastery of the subject. To allow a man so highly equipped to fall back into the narrow groove of inconsequential duties would be a pitiful waste of precious human material. He is only 45; he has shown the four qualities essential to leadership: the faculty of scientific analysis, executive ability, the power of organization, and the civic spirit, warmed by the love of his fellowmen and inspired by the divine spark of humanitarian service. He is, we believe, the most useful man in the world today. "Elect him President!" exclaim his admirers all over the country. Indeed, he is fitted for that exalted position, but the road to the presidency passes through the swamps of politics, and for politics of the ordinary kind Mr. Hoover has no use. He does not suffer fools gladly and for the insincerities of the political arena he has neither liking nor aptitude. He is not a partisan of either of the existing parties; formerly a Roosevelt Republican and later the loyal supporter of a Democratic president during a critical period, he belongs to a generation that has outgrown the political alignments of a bygone day. The cleavage between the two national parties is based upon a dead issue, that of the Civil War; the questions that excite us today are oriented in new directions and look to fresh horizons. Our political assignments are out of date; there is need for a new alignment, such as was attempted by the formation of the Progressive party, which, however, failed because it was linked to the Republican tradition. Mr. Hoover is the exponent of the liberal thought of this generation and will be a leader of the Liberal party of tomorrow, but we doubt whether his temperament or his ambition lead to the Presidency. An important post for which his experience would fit him is that of representative of this country on the Supreme Council of the League of Nations. The Council will be in continuous session, it will be immensely important, it will call for the very best men available, men of rare knowledge and sagacity. Mr. Hoover would fit the appointment, but we understand that it is proposed to assign this post to the latest ex-President, and it is anticipated that Mr. Wilson will nominate himself for it at the end of his present term of office. A post for which Mr. Hoover would be admirably fitted is the administration of the proposed Department of Public Works, in which are to be concentrated the engineering activities of the Federal government; but any such appointment is tied to politics, and, in any event, it does not afford sufficient scope for a man of Mr. Hoover's calibre. We think that a larger and a better task awaits him, namely, to organize and to inspire a great newspaper. Heaven knows we need one in San Francisco and in California! In a democracy the prime factor is education, for upon it is based the whole superstructure of representative government. We have two universities, both doing good work; Mr. Hoover is a

trustee of Stanford and he might well be elected to the vacant presidential chair at Berkeley; but the people of this, or any other progressive community, are educated as much by their newspapers as by their universities. In this State the good work of our schools and universities is undone by a group of the meanest and most meretricious newspapers in the English language. Three or four years of healthy mental training at college is perverted by thirty or forty years of newspaper pollution, such as is reflected in the debased tone of our municipal life. A straight, strong newspaper under the inspiring leadership of a great man would be wonderfully educative to the whole community, old and young alike. It would be a godsend to San Francisco, to California, and to the Pacific Coast, besides serving the highest national purpose. Mr. Hoover can get all the financial backing that might be required; and as for coadjutors, editors, and managers, he can draw upon the group of remarkable men whom he attracted to his staff in the beneficent work he has been doing during the last five years; among them he can find the talent and the character needed to produce a newspaper that will inspire good citizenship and stimulate the best ideals of Americanism. Is there any better work that he can do?

Concerning Strikes

Our local strike has been ended by an agreement on the part of the car-men to go back to work pending the submission of their claims to arbitration. The credit for this is due to the State Railroad Commission, which called representatives of the employees and the officers of the company in conference. A day before the strike was ended the two unions of electrical workers threatened to go on strike and plunge the community in darkness, in order, apparently, to force the traction company's hands. As the electrical unions were under agreement not to go on strike without 30 days notice, their action was a piece of sabotage—an act of social piracy. During the strike several men were killed and many more were injured by the use of fire-arms and clubs. The spectacle was seen of armored cars, manned by heavily armed guards, going down the streets of a city in time of peace. Why should anybody be permitted to carry deadly weapons contrary to the law? The car company pays taxes to the city, county, and State, and in return, among other things, it is supposed to obtain the protection of the city, county, and State. It ought to obtain that protection and it ought not to be forced to arm its employees for their protection; indeed, it ought not to be allowed to arm them for any reason whatever. As for the strikers, the police—the properly constituted guardians of order—should have arrested any of them found carrying arms and ought to have prevented their assembling in mobs. If the police force is inadequate, more men ought to be sworn in; nothing should be spared in the effort to sustain the law. To us it seems that the fact of striking or the ending of the strike is much less important than the incapacity of the Mayor to deal with the crisis and the

inability of the police to assert the law against both sides. The difficulty was increased by the presence of the shipyard strikers, who, as the police records show, were largely responsible for the disorder and violence. During an attack on a street-car, the motor-man was greeted with cries of "Scab!" He did not retort for a while and when he did he laughed sardonically. "Scab, you say! While I was fightin' in France at \$30 a month, you were being paid big wages for hidin' away in the shipyards."

Another strike has been settled, namely that of the miners in the Tonopah Divide district, in Nevada. This, like others, was started by the irresponsible radical element. They refused to arbitrate and they even refused to give the Governor a hearing when he attempted to address them. The agitators who fomented the trouble boasted openly that they had never worked in the mines, but had come there "to help the boys win the strike". They picketed the mines and threatened those who were willing to work. As stated in our Review of Mining last week, the strike was stopped by the organization of a union of the actual workers in the district and an agreement by the operators to guarantee a 15% reduction in the cost of living by means of a general store, to be run for the benefit of their employees, not as a source of profit to the companies. At the instance of the Governor, Mr. Emmet D. Boyle, a mining engineer, a restraining order has been issued by the District Judge at Tonopah against the I. W. W. leaders, enjoining them against incendiary talk and intimidation. Another strike that has fizzled out is the one in the Coeur d'Alene region of Idaho. This had involved all the principal mines except the Bunker Hill & Sullivan, at Kellogg, and it did not involve this particular mining enterprise because the management for twenty years had made a sincere effort to treat its employees humanely and squarely. We shall revert to this on another occasion; for the present we desire only to lay stress on the fact that one of the best preventives of labor troubles is the humane and considerate treatment of the workers, consistently and sincerely, not intermittently under threat nor insincerely for commercial reasons. It will be noted that most of the recent strikes have been started by un-American anti-social elements on the fringe of real labor, in the furtherance of a movement not so much to ameliorate the conditions under which men are working or to increase their wages as in the furtherance of a campaign of anarchy. The strike among the press-men in New York, like the one threatened by our local electrical workers, is in flat disregard of contracts and agreements. The only cure for that is to pass legislation compelling the unions to incorporate, so as to render them responsible for breach of contract, and then to hold the companies and the unions impartially to the observance of their obligations. The general lack of spirituous liquors to inflame the passions of the disputants has been one favorable feature, but, as we have insisted, the carrying of lethal weapons continues to be a bad symptom and it is an offence against the law that a democratic regime should not tolerate, whether done by the employer or the employee.

Tariff Protection for Metals

The Editor:

Sir—There has been some discussion lately on the subject of placing a protective tariff on such things as quicksilver, chrome, and potash. No doubt such a tariff would stimulate some industries. From the point of view of a gold-miner, however, it appears that most of the industries are too much stimulated already. The demand for labor is certainly already greater than the supply, so why tax certain consumers and pay this tax to favored industries in order that they may go into the labor market and cause wages to go still higher? Everyone will admit that a tariff has the effect of raising prices, and yet there is a great cry going up that at present prices are too high.

It has been stated that it is desirable to produce quicksilver and other things in this country in order that we may not be left at the mercy of foreign producers. This does not seem to be a good reason for causing the consumers in this country to pay a higher price than foreign consumers for raw materials while the low-grade deposits in this country are being exhausted. It would seem better to give consumers here all the benefit of cheaper products until such time in the distant future as the foreign supplies become exhausted, when the law of supply and demand will raise the price to such a level that the mines in this country can be operated at a profit. Then both foreign and domestic consumers will have to pay the high prices.

A tariff on such an article as chrome does not in itself cause much hardship to domestic consumers, but a tariff on raw materials always results in a tariff on articles manufactured from the materials, and it is these resultant tariffs that cause inflated prices. For instance, suppose a tariff placed on chrome raises the price to what it was here while imports were cut off. The steel-makers will immediately require a tariff to protect them from competition with foreign steel produced with cheaper chrome. After this tariff has gone into effect, all manufacturers using steel will want protection from foreign manufacturers using cheaper steel. And so it goes.

It is difficult to persuade the poor gold-miner that it is to his interest to pay high prices for his quicksilver and blasting-caps in order that some other miner can operate a mine that is too poor to pay. There are plenty of gold mines, too poor to pay under present conditions, that are continuing in operation in the hope of lower prices in the future. If this hope be not realized, there is nothing left but to close-down.

So the effect of artificially increasing the value of the ore in one mine will result in decreasing the value of the ore in another, and cannot result otherwise.

ARTHUR B. FOOTE.

Grass Valley, California, September 29.

High Costs

The Editor:

Sir—In your editorial on this subject, in your issue of August 30, you make the statement: "Money is nothing more than a medium of exchange, a convenient yardstick by which the product of one man is measured in terms of the product of another."

I do not believe that your definition is quite complete. As far as I can see, a yardstick is a measure of extension only, and as such, of course, can be used as a means of estimating quantity, but it can never be an indicator of quality, while money must also perform the function of indicating the parity or disparity of quantities in terms of quality. I, therefore, would like to have you revise your definition so that it will indicate the degree of 'quality' contained in or ascribed to a specified 'quantity'.

Flotation in Stages

The Editor:

Sir—I notice in the issue of September 20 an article by Will H. Coghill, entitled 'Flotation in Stages,' in which he apparently takes the stand that stage-grinding in conjunction with stage-flotation is something entirely new to the art.

On May 29, 1914, application for U. S. Patent, Series No. 841,710 was made by Ernest Gayford and George Crearar, and on March 21, 1916, patent No. 1,176,441 was issued, the same having been assigned to the Metals Recovery Company. The first claim in this patent reads as follows:

"The process herein described, consisting, essentially, in progressively reducing, by successive stages, ore mixed with water and a frothable agent having a preferential affinity for metalliferous matter, aerating the mixture resulting from each reduction, and floating off the concentrates liberated at each reduction."

The idea of the patentees at that time was not only increased recoveries but also to obtain a product containing

more coarse material and therefore more acceptable to the smelters and easier to handle in the mill.

I note also that Mr. Coghill takes the stand that by excessive crushing, preceding flotation, many of the free and floatable mineral grains are so unnecessarily finely ground that a part of them is irrecoverable. Mr. Coghill has apparently taken his experience from the result of work on a particular molybdenite ore, and while in this case—owing to the physical nature of the material under treatment—his loss in the fine mineral particles may have been high, our experience, when using pneumatic cells, has almost universally been that the finer sizes in the flotation tailings carry lower values than the coarser sizes.

In some mill-scale experiments recently completed, covering a period of 30 days and treating 50 tons per day, particular attention was paid to the value left in the flotation tailings after grading them, and it was found in every case that the minus 200-mesh material, which amounted to over 80% by weight of the total, was considerably lower in grade than any of the sizes above 200-mesh; and in some cases the minus 200 was 50% lower grade than the coarser sizes.

ERNEST GAYFORD.

Salt Lake City, September 25.

Gold, Prices, and War Debts

The Editor:

Sir—It is only recently that Mr. R. B. Brinsmade's communication on this subject in your issue of August 16 has come to my notice, and while, apparently, he has given considerable attention to the general subject of economics, it is evident that his ideas regarding the basic principles of money are somewhat clouded; because he says, "In the case of the monetary standard, gold, its exchangeable value has been arbitrarily fixed in legal tender by government fiat, and this creates an unlimited demand for it." Also, later on, in referring to gold mines, he says "The price, in money, of their product, being thus fixed by law." I understand the latter sentence to mean the price of gold, in money, being thus fixed by law.

In my several contributions on 'The Status of Gold' I have persistently endeavored to show that the exchange-value of that metal has not been fixed by government fiat, but Mr. Brinsmade seems to have overlooked this point of my argument. Permit me to try again.

When our Government enacted the law which made the unit of value 23.22 gr. of gold, the only arbitrary things it did was to declare gold to be the *standard* of value and 23.22 gr. of gold the *unit* of value. But what amount of other commodities, or goods, this unit of value may exchange for, or buy, in the marts of the world or at home, depends entirely upon the exigencies of trade and commerce as evidenced by supply and demand. Government fiat has nothing whatever to do with such exchange-value.

Furthermore, the word 'price' means the exchange-value of anything, *excepting gold* (as will, hereinafter,

be explained) expressed in terms of the unit of value. Our unit of value is 23.22 gr. of gold, and the fact that 20.67 of said units weigh 480 grains has nothing to do with the exchange-value of gold; such exchange-value means the amount of other goods a stated quantity of it will bring in trade; that is, when it is swapped for something else.

The term 'mint price' per ounce has been applied to gold, but its true meaning is seldom understood. What it really means is the number of units of value into which an ounce of gold is divided in the process of minting, or coining. For a similar reason the 'mint price' of silver, also called 'coining value', is 1.29 'dollars' per ounce; which simply means that, in coining silver 'dollars', each 480 gr. of fine silver will make 1.29 dollar-pieces; but it has nothing to do with the bullion-value of the 371½ gr. of fine silver in that 'dollar'.

Inasmuch as all exchange-values are relative, that is to say, comparative, it must, necessarily, be impossible to express the exchange-value of anything in terms of *itself*. This fact must be thoroughly understood. To say a ton of coal is worth 20 hundredweight of coal conveys no idea of exchange-value. Similarly, to say an ounce of gold is worth 20.67 units of value conveys no idea of exchange-value, for it simply means that 23.22 will go into 480 twenty and sixty seven hundredths times. The term 'price' as applied to gold, therefore, is clearly a misnomer, and it is just as much so as if the 'price' of a ton of coal is said to be 20 hundredweights of coal.

Recurring now to Mr. Brinsmade's statement that "In the case of the monetary standard, gold, its exchangeable value has been arbitrarily fixed in legal tender by government fiat," let us go back to 1896, when a bushel of wheat was valued at 19.5 gr. of gold; a bushel of corn at 6.5 gr.; and a pound of cotton at 1.63 gr. Relatively, therefore, a bushel of wheat was worth (exchangeable for) 3 bushels of corn or 12 lb. of cotton. At present, a bushel of wheat is worth 54.5 gr. of gold; a bushel of corn 34.8 gr., and a pound of cotton 8.1 gr. (yesterday's New York prices for wheat and corn. Cotton at 35c. per lb.; present quotations not available).

If, as Mr. Brinsmade says, the *exchangeable* value of gold has been arbitrarily fixed by the government fiat, why is it that it takes *now* nearly three times as much of it to buy a bushel of wheat, more than five times as much of it to buy a bushel of corn, and nearly five times as much of it to buy a pound of cotton as it did in 1896? The 'mint price' of gold is the same now as it was in 1896 but its "exchangeable value" is only from about one-third to one-fifth as much as it was then, as measured in wheat, corn, and cotton; and similarly for other commodities. Of what use, then, is the 'mint price' of gold in determining its purchasing power? There can be but one answer; it is of no use whatever.

In company with others, I am a producer of gold. At regular intervals we send our bullion-bar to market, where it is weighed and assayed and, in due course, we get an order on a banking-house for as many 'units of value' as it contains, less such as are deducted for refining, etc. In ordinary times we could send it to the

Mint and get gold coin for it, weight for weight, less a small minting charge; and that is what is meant by "free coinage;" but whether each 480 gr. of fine gold in the bar is divided, in the form of coins, into 1.03 parts (double eagles) or 2.06 parts (eagles) or 4.13 parts (half-eagles) or 20.67 parts (dollars) has nothing whatever to do with the exchange-value of the quantity (weight) of gold in each of such parts, or coins.

Government fiat arbitrarily declares the weight of gold that shall be put in each of such coins, but it does *not* declare what quantities of other commodities the possessors of such coins shall accept in exchange for them. Consequently, government fiat does *not* arbitrarily fix the exchangeable value of gold.

W. DE L. BENEDICT.

Del Monte, California, September 30.

A Job for Hoover

The Editor:

Sir—On a street the other day two bloated prosperous-looking fellows with pugnacious jaws were overheard in a fragment of conversation on the labor situation.

One asked, "Didja see that piece in the paper this mornin' about that city back east advertisin' fer street-sweepers at over \$36 a week, an' in the same paper was an advertisement fer a collij perferesser at about \$19 a week? Now, wot duh yuh t'ink o' dat?"

The sneering reply was, "Serves 'em right, de damn bone-heads. If dey had any brains dey'd organize."

The remainder of the conversation was lost in the crowd, but the portion overheard recalls a story that was published recently in 'Everybody's', in which the scion of a wealthy northern family was riding to town from a southern plantation beside an old negro who drove a six-mule team. This driver was very adept with the long black-snake with which he persuaded the reluctant mules from time to time. He cracked it with a report like a pistol-shot within an inch of one of the leaders; he cut to bits a horse-fly that was engaged in raising a welt on the fat side of one of the wheelers, without touching a hair; he snapped a bumble-bee from a flower fifteen feet from the road, and performed other feats showing his skill with the whip, to the delight and wonderment of his young passenger.

Finally, the boy spied a hornet's nest depending over the roadway and, in anticipation of some fun, he suggested to the driver that, as further proof of his proficiency with the whip, he might use it as a destroyer and cut the nest in half.

"Not on yo' life, honey," the skilful one replied, with a grin. "Ah knows Ah could do hit, an' Ah don't mine snappin' hoss-flies an' bummel-bees one het a time; but yo' all don't catch me pesticatin' wiv no ho'net's nest. Dat's ohganized."

Now, is there not a germ of truth in the first speaker's criticism of the college professors, and does it not apply equally to us engineers and members of other underpaid professions? And is there not a valuable hint at a remedy in the foregoing paragraph? These men spend thou-

sands of dollars and four or five of the best years of their lives in fitting themselves to train and educate others or to handle important operations in basic industries. Is it fair that they should receive less pay than unskilled laborers, or skilled ones who earned while they were learning and who emerged—or should have emerged—from their apprenticeship with money in the bank, instead of the debt which so often accompanies the diploma of the college graduate?

At this very moment a local labor agency is advertising for technical men (mill-men) at \$4.50 per shift, with a dollar per day out for board. They must pay railroad and stage fare, amounting to nine or ten dollars, carry their own bedding, and live in desolate mountains away from family and friends, amid the most dreary surroundings. The same agency is hiring common laborers at \$5 per day of eight hours, to work in San Francisco. And 65,000 men are striking for higher pay, within and about this same city.

Technical men of high qualifications go begging for jobs and are offered \$100 to \$150 per month to fill positions requiring several years in college and as many more in practical training in the field. Professors and instructors are given similar salaries in institutions of learning that are supposed to be well endowed. No wonder labor agitators sneer.

Something is wrong. Is there any other remedy than organization? And, if organized, how would desirable results best be accomplished? College professors may consider so practical a procedure as a strike altogether too business-like, too realistic; and engineers may consider it beneath their dignity, mining engineers especially having come to abhor labor-unions because of unpleasant experiences with agitators of the most radical type.

Of course, we have our societies and our institutions, all of which are very well so far as they go. But, aside from the interchange of knowledge and ideas, of what practical benefit are they? Organized brawn brings wide-spread pressure to bear to secure better pay or better living conditions, or to correct a real or fancied injustice to one of its members. Unorganized brain takes whatever scraps are thrown its way. Organized brawn maintains that "the laborer is worthy of his hire" and that every worker is entitled to a compensation sufficient to permit him to support a family in decency, and takes steps to secure such compensation. Must unorganized brain strangle its family or suffer the curse of bachelorhood when its perpetuation is more vital to the nation?

There are many engineers and some college professors who receive large salaries—or who, at least, have large incomes—but these are men of extraordinary ability or exceptionally good fortune. For these no appeal need be made. It is the average men, the rank and file, who need improved conditions—for the most part men of high ideals, strict integrity, energy, and knowledge, yet lacking in opportunity or business acumen, or possessed perhaps of some unfortunate personal factor that mitigates against financial success.

Living expenses have more than doubled within a few years; but where have the salaries of technical men or

educators advanced proportionately? Salaried men in general have been ground between the millstones of labor monopoly and capital monopoly, with only local and temporary relief from the torture. Permanent relief is a problem that can be solved only by men of strong influence, keen vision, and a knowledge of the conditions and requirements of this particular field of work. Such men are usually too busy or too careless of the problems of their less fortunate associates to undertake the solution. However, at this opportune time appears a man who can and who has the heart to do it. Compared with the work Mr. Hoover has been doing the past five years his present activities must seem trifling; so, before he again becomes too heavily loaded, he might be induced to undertake a work that would be of lasting advantage to the members of his own profession, as well as to many others.

The case is respectfully submitted to him.

R. H. TOLL.

Berkeley, California, October 5.

Sampling Large Low-Grade Orebodies

The Editor:

Sir—Referring to my letter to 'Discussion' appearing in your issue of September 20, I have read your editorial on my letter and I am much surprised at it, knowing how careful your editorial columns are in respect to dealing with the facts. You say as follows: "Mr. A. R. Pierce writes on the subject of 'Sampling Large Low-Grade Orebodies,' which was discussed freely in our columns a few months ago. It will be observed that Mr. Pierce is in error on one point; he assumes that the method of determining a sampling factor by comparing hand-samples with mill-tests, as advocated by Mr. Morton Webber, was intended to be applied only to deposits for which the sampling factor would be uniform over large areas, whereas those who have followed this discussion from the beginning will remember that it had its inception in the difficulty of sampling with accuracy deposits whose metal occurrence was essentially erratic."

As I have retained clippings of all the contributions to this important subject, I will proceed to point out that you are not justified in the above statement that I have misunderstood the intent of the valuable contribution to the subject of sampling by Mr. Webber.

Under date of your issue of September 29, 1917, Mr. Webber writes as follows: "The origin of the discussion to which I was asked to contribute, was the discrepancy on the ores of the Alaska Gastineau between the results of mill-tests and the outcome of subsequent full-sized operations." Mr. Webber then goes on to describe the 'combination' method devised by him for the sampling of a large low-grade deposit in Central America. He says: "I will describe a method designed by me for the examination of a large low-grade deposit in Central America." He then goes on to state "the mill-test disclosed a sampling error averaging about 40 cents on an expected mill-head of \$3.50. This was roughly 40% of

the expected operating profit." It was this 'combination' method that led to the subsequent discussion by E. P. Spaulding, R. Raymond, Charles Bennett, F. F. Sharpless, and others, whose writings I have all before me and none of these gentlemen have inferred that the 'combination' method was intended for or could be applied to deposits where the "metal occurrence was essentially erratic;" I therefore feel that your editorial stating that I have misunderstood the matter is ill considered and uncalled for, and to drive my statement well home I will quote further. Under date of your issue of March 29, 1919, in reply to a criticism by H. R. Sleeman of Australia, Mr. Webber writes as follows: "The combination method of sampling large low-grade deposits was not intended to apply to ordinary size mine examinations. This was clearly pointed out in the original contribution. The method was intended for sampling great low-grade deposits such as the Alaska Gastineau, Alaska Juneau, and others, where a loss of, say, 40 cents per ton between mine-sampling and mill-heads might mean complete financial failure." He also says: "The principles of this 'combination' method will apply to best advantage in mines of fairly uniform mineral characteristics. The greater the variation, the shorter must be the distance between one mill-test and its neighbor, and the reverse."

I therefore must energetically stand by my guns wherein I say, "In the large low-grade deposits for which this 'combination' method was intended, the sampling error, in my opinion, will be found to be generally small or generally great. It will not jump about from place to place as would be expected in a mine of the bonanza type."

In conclusion, while I resent your editorial suggesting that I have broken into print on a subject on which I have not properly familiarized myself in respect to previous writings and premises, I beg to state that I am intensely interested in this important subject and I would much appreciate Mr. Webber or some other authority answering the questions I put which appeared in your issue of September 20, 1919.

A. R. PIERCE.

Kansas City, September 26.

[We are glad to give space to this criticism. It is possible that the misunderstanding is caused by the fact that Mr. Webber's contribution in the issue of September 29, 1917, to which Mr. Pierce refers, was not the beginning of the discussion on 'Sampling Large Low-Grade Orebodies', but was an enlargement of an earlier contribution by Mr. Webber on the same subject. The entire discussion had its inception in an editorial that appeared in our issue of May 26, 1917, which summarized the various contributions that had been previously received, and asked for further opinions on the best methods of sampling this difficult type of deposit. Messrs. J. H. MacKenzie, D. C. Jackling, and H. C. Perkins were quoted on the practicability of sampling accurately such large low-grade orebodies as those in south-eastern Alaska. In this editorial, as in many of the contributions that it called forth, the difficulties introduced by the erratic occurrence of the gold were considered at length.—EDITOR.]

The Treaty and the Covenant

By HERBERT HOOVER

*I have been urged by Mr. Taft and others to state at some greater length my views on the Peace Treaty, and I take this occasion to present them to my own townspeople. During the ten months between the Armistice and harvest I acted as the economic director for the Supreme War Council. I was necessarily in intimate contact with the political and economic situation all over Europe. I was not one of the American Peace delegates, but the purpose of my office was to act on behalf of the United States and the Peace Conference in an effort to save life and prevent anarchy while the Peace was negotiated. I therefore had an advantageous position to independently observe the growth of ideas in the Conference and the re-percussions of these ideas through Europe.

I am not of those who have an impatience of honest debate. I believe that the debate on the League of Nations going on in the United States is building the very foundations of the League; it is bringing home to every household in the country the necessity and possibility of providing for our own safety and of providing for the safety of the world as a whole without great armies or navies. Nor do I believe in the criticism of the Senate for not accepting out of hand this document so laboriously evolved by five hundred conflicting minds in Paris. It is a fundamental part of our institutions that the Senate shall scrutinize these matters. Consideration and debate by the Senate is not traitorship.

Nor were those Americans traitors who, in representing us in Paris, fought for every inch of hope that the weak could be protected and the strong curbed, that the United States could itself be protected. If they were traitors to their country it was because they were wrong in assuming that the American people wished an effort made to destroy the seeds of war and thus to secure the growth of liberty.

The treaty finally reached at Paris is by no means perfect. I see no method by which it could have been made perfect when 500 men, representing 23 different nationalities, engaged in its negotiation and agreement had to be unanimous. Difference in national character and in national aspirations could but cause much difference in views. Many of them represented desperate, passionate, or selfish objects, some were dominated by political ideals of the last century, yet the most were actuated by the prayers of the common people, who really fought this war, that it should be the last war. There existed in the world before this Conference scores of those major international wrongs which breed war. Of these the Peace Conference corrected some, but it will

take perhaps a hundred years for the men of good will to correct them all. It is often overlooked that this was not a conference to settle wrongs committed by Allies or Neutrals, but by the Enemy only. It was German wrongs that were on the operating table. It would have been beautiful to have all the international wrongs on the table, but this is not a perfect world. As a practical fact, if this had been attempted, the Conference would have broken up in quarrels among the Allies, and Germany would have been handed again the domination of Europe. The old guard in Germany hoped and expected that this would result; up to date at least they have been disappointed. No one could be more disappointed than the American delegation that some great wrongs that were the result of the secret treaties that had been written in times of complete desperation among the original Allies were not eradicated at the Conference. In this the American group was a minority of one, endeavoring to secure that right should be done, in a meeting that required unanimous agreement. There are many other items in the Treaty which men of good will would have liked to see different. Our delegation could have found cause to withdraw from the Conference on many scores. We would have been withdrawing in the face of the Enemy, and Germany, by this division of the Allies, would have been victorious.

Greater things were accomplished by this Conference than by any other in history. The military oligarchies of Germany, Austria, and Turkey were dissolved, and if peace is ratified in time they will be disarmed, and thus a paramount menace to us and the world will be destroyed. The Poles, the Czechs, the Finns, the Croats, the Slovenes and Slovacks, the Baltic States, Armenians, Arabs, have, or will, subject to ratification, secure their liberty. Parcels of French, Italians, Rumanians, Serbians, Greeks, have been re-joined to their mother countries. Representative democratic governments were set up in the liberated and enemy States. Methods were devised by which these peoples would be free from economic domination and by which the Germans and their Allies would be made to pay something on account of the terrible destruction they have wrought, as a lesson to militarism.

The men of Liberal vision at the Conference were steadfast for certain dominant ideals that mark this conference apart from all others. First, that this settlement should remove as many of the immediate causes of war as possible by destroying enemy domination over other races. Second, by establishing the new governments on a democratic basis so that wars should not be made by autocracies for the profit of their class. Third, that there should be established a world council—the League. Here

*An address delivered at the Assembly of Stanford University on October 2.

these newly liberated peoples could find some measure of protection from invasion. Here, with the stimulation of the world conscience awakened by this war, there could be hope that the wrongs among other peoples could be brought for discussion and negotiation. Here, if aggression were undertaken, the public opinion of the world could be enlightened and the aggressor could be made an outcast from the society of the civilized nations. Thus only could something constructive be done to end war. This is an aspiration which has been rising in the hearts of all the world. It has become an insistence in the minds of all those in the world to whom the lives of our sons are precious, to all those to whom civilization is a thing to be safeguarded, and to all those who see no hope for the amelioration of the misery of those who toil if peace cannot be maintained.

To form a League of Nations for this purpose has been proposed by the leaders of both our great parties time and again. It has been proposed by leading spirits in all civilized nations. It belongs to no one man, it comes from the heart and mind of the world.

I have always regarded it a mistake that this was termed a 'league', for the term smacks of military alliance. It is, in fact, a council of nations that requires in all important matters unanimous decision. The major provisions of this Council look toward disarmament and provision of place and time for negotiation and arbitration of quarrels. Its most potent weapon is the determination of rights and wrongs of international quarrels and the enlightenment of the world upon them, and thus the moral isolation of the aggressor. If this fails, its second weapon is the boycott, the most potent force in the world today—the force that more than any other brought Germany to her knees. It agrees that military force can be used in defense against invasion of one country by another, but in this, as in other important things, unanimous consent is required, and consent must mean the United States Congress on our side. From my own experience, I believe that the discussion, negotiation, arbitration, enlightenment of public opinion, and thus the moral definition of an outcast, will be all-sufficient, coupled with the knowledge that other weapons exist. The hope that I, as an independent observer, have placed in the League, was that it would forever relieve the United States of the necessity to again send a single soldier outside of our boundaries.

The opponents of the League are of many conflicting minds. There are those who truly wish this experiment in the promotion and preservation of human liberty to be tried; they, however, wish the details altered and have fears that the details agreed upon may themselves involve us in war. Others believe that the interest of the United States lies in keeping out of all international action.

Others believe that the old game of arms is the best promoter of civilization; still others oppose it from disappointment that all the ills of the world were not corrected at this one session of the nation. But few of them acknowledge that this terrible upheaval and its aftermath of conflicting economic, social, and political forces

have endangered the stability of the world for years to come.

Those who formulated the League did not expect that it would furnish an over-night solution to all uncorrected international wrongs or the disruption of these unloosened forces. They did expect that by degrees there would be a definite alignment of opinion in the world that would make these wrongs less and that could in great measure restrain the actual outbreaks of war, that could give the world time to heal its wounds. Even the Sermon on the Mount did not wholly regenerate the world.

We hear the cry that the League obligates that our sons be sent to fight in foreign lands. Yet the very intent and structure of the League is to prevent war. There is no obligation for the United States to engage in military operations or to allow any interference with our internal affairs without the full consent of our representatives in the League. If there is any danger that we should be charged with an obligation to go to war, either direct or implied, without the full consent and approval of Congress, I believe the President will be the first to agree to any interpretation that this cannot be. The French government so far takes this view that it has requested from us a separate military guaranty for themselves.

The League is founded expressly in the attempt to secure the pacific settlement of these questions without military force. To me, every line of it is the complete negation of militarism. During the course of negotiations in Paris one fact stood out with regard to the League. Its opposition there arose entirely from the representatives of the old militaristic regimes, and from the reactionaries of the world in general. They saw in it truly the undermining of militarism. They had the vision to see and even to state openly that it would mean the ultimate abandonment of military force in the world, for they, as of old, contend that without military exercise there is no hope of the maintenance of human efficiency or control of the masses. What they foresaw has already happened in a great military nation like the British, where the population, broken under a load of taxation, is responding quickly to the new possibility of international safety without the burden of gigantic naval armament. The reactionaries saw that under the hope for the protection of the League of Nations there would be a growing opposition to the burden of armament from all those who labor with hand and mind. It is the workers of the world who pay the price of war, not alone in the support of arms but in blood and in the support to tyranny which armies mean in peace.

All wars have hitherto been settled on the basis of trying to create a balance of military strength by intriguing peoples into various groups of equal military weight—the balance of power. It would have been impossible to give liberty to the score of new nations of militarily weak yet liberty-loving people without the League to safeguard them from invasion. Beyond this, every attempt to set up this balance hitherto has ultimately crashed in war, for its essence is militarism. The creation of the League brought new hopes into the Peace, and if the League fails these new liberated nations must

fall, for the world must re-adjust itself into the balance of power and great wars will re-open at once in this realignment. In a recent visit to many of the capitals of the new States, the first anxious question of their officials was, "Will America ratify the League?" Their invariable answer was that without it their only course was the hopeless effort to arm themselves against stronger neighbors; to do it in the midst of misery; to endeavor to set up groups and military alliances with all the old treadmill of oppression of arms and ultimate war.

There are many elements in Europe that wish to see the treaty break down and the League of Nations disappear. For instance, during the last five months our Allies have been growing weaker from a military point of view, due to the necessity of demobilizing their armies, while at the same time the reactionary group in Germany has been growing in strength through the re-creation of hopes of yet securing a division of the Allies. At the time I left Europe, a month ago, German militarism had already re-established itself as a well-disciplined well-officered army of at least 400,000 men, largely congregated on the Polish frontier and even defying the government at Berlin. Under the alarm of this danger, the Poles, in the midst of the greatest economic misery that a nation ever knew, have been trying to create an army of 500,000 men for their protection from the Germans on one side and the Bolsheviki on the other. If the treaty is ratified the German army will be reduced to 200,000 men and dispersed over Germany, and their extra armament destroyed. The failure of the treaty means the invasion of the Polish state. This is only one of the powder-magazines in Europe which cannot be destroyed until their treaty is ratified, and during every day of delay more explosives are poured into them.

For good or ill, the entire treaty was constructed around this central theme of a League of Nations to prevent war. A score of provisions in the treaty and outside the covenant necessitate its erection. To avoid causes of war, the League has been made the trustee to secure outlets to the sea, to secure free ports to inland peoples, to settle deferred disputes which could not otherwise hope for solution without dangerous friction. The treaties themselves cannot be carried out without the League. If the League falls the treaties also fall.

The boundaries of these new States cannot precisely include all their own nationals, for the borders are lined with racial islands and friction. Peace and a moderating council are required for re-adjustments. Their outlets to sea by rail, canal, and river are through other States; their whole political and economic situation demands peace for the growth of order and the prevention of anarchy. If the balance of power has to supplant the League of Nations we will have torn asunder the only hope that Europe will not break into further wars of races, classes, and groups that will take her civilization back to the Middle Ages. I am convinced that if we attempt now to revise the treaty we shall tread a road through European chaos. Even if we managed to keep our soldiers out of it, we will not escape fearful economic losses.

If the League is to break down, we must at once prepare to fight. Few people seem to realize the desperation to which Europe has been reduced. During the coming winter some of them will look with longing eyes on this rich fat nation, possessing great surpluses of every human necessity, while they endure inevitable hunger and cold. At the same time, the energy of our population is supplanting them in places where their merchants expect to market their goods and operate their ships. Others of them will be plunged into war with their neighbors, and we have already experienced the difficulty of maintaining neutrality with self-respect and safety. We cannot fiddle while Rome burns.

The Allies may themselves ratify this treaty without us, and thus assemble a Council of Nations of their own in an endeavor to solve the problem of Europe. It would be a Council of Europe, and in the midst of these terrible times, with the debts they owe to us, the material they must have from us or starve, I would rather be represented therein lest it become a League of Europe against the Western Hemisphere.

It is true we are not loved by certain classes of people, some of them among our former allies. It is untrue, however, to say that the masses of any nation now hate us. It is still more untrue to say that the newly liberated peoples look to us with other than the conviction that our moral leadership is their only hope. We are not loved by any military class, whether in the allied or enemy countries. Our whole object has been to destroy their calling, to undermine their class. The great masses of burdened working people, however, look for us to support this one hope of relief from domination, from burdens and misery of arms and war.

Neither the gospel of hate nor the gospel of unpreparedness is the road to peace. The true road lies in every effort to remove the causes of war, not in tearing down such structure of peace as we have, nor in blindness to present dangers.

Those who think we can isolate ourselves seem to ignore the fact that modern communication has shortened our distance from our neighbors from a month to an hour. A vast amount of our civilization and the daily improvements of life that come to our people are the products of the ideas and intelligence and labor of our neighbors. If we believe we can see our neighbors return to a thirty years' war through the breakdown of this treaty and we still maintain our progress, it is the egotism of insanity. We are an overseas people and we are dependent upon Europe for markets for the surplus products of our farmers and laborers. Without order in Europe we will at best have business depression, unemployment, and all their burden of troubles. With renewed disorganization in Europe, social diseases and anarchy thrive, and we are infected with every social wind of Europe. We are forced to interest ourselves in the welfare of the world if we are to thrive. There is no American who has spent the last ten months in Europe who does not pray that we should get out of entanglement in the sordid selfishness, the passions, the misery of it. But our expansion overseas has entangled us for

good or ill, and I stand for an honest attempt to join with Europe's better spirit to prevent these entanglements from involving us in war. We are not dealing with perfection; we are dealing with the lesser of evils. These are reasons of interest.

There are also reasons of idealism. True national interest lies along the path of practical ideals; and there are ideals in Europe. During the last 150 years, a far larger proportion of our citizens have grown far ahead of those of Europe in outlook on life, in disinterested sense of justice, in sympathy with the down-trodden. It was with the hope of ending war that we went into it, and to fix it in international law that dominated our representatives in the Peace Conference. We have expended the lives of our sons and an enormous portion of our wealth, hoping to see these ends. For us to refuse to enter into a joint attempt with the well-thinking sections of a large part of the world to establish a continuing moral conscience against war is the utmost folly in our own interest.

We have been the centre and inspiration of democracy for a hundred years. We have given sympathy and encouragement to every aspiration for self-government for all this time. We have from our experience in its blessings believed it made for peace and well-being. We enjoy from it the highest standard of living in the world. We went to Europe with our best blood and our treasures and fought the attempt to impose autocracy on the world. We won. We imposed democracy all over Europe. We set up a score of new democracies—and they are many of them peoples of our own blood—the Baltic, Polish, and Slav races. Are we to refuse our counsels to these peoples now struggling to realize our own ideals? Curious as it may seem, this also embraces Germany itself. That sincerely democratic group which today controls Germany is losing ground before the old reactionary group who employ the hope of the failure of the league to fan the renewed hope of domination.

I am one of those who hold that this war would never have happened if the nations of Europe had accepted the invitation of Sir Edward Gray to a conference of civilians in July 1914. I believe that if the intelligence of the world can be aggregated around a table, the pressures from the responsibility of these men for the possible enormous loss of life and the fabulous amount of human misery created by their failure to prevent war are such that no body of decent men in these times can fail to secure some sort of solution short of war. We have now seen the most terrible five years of history because the reactionaries of Europe refused to come into a room to discuss the welfare of humanity. From this mighty political, social, and economic upheaval there are a host of outstanding problems which can breed war at any minute. The Liberal world is asking us to come into a Council to find solution for these things. It is not asking for soldiers, it is asking for our economic and moral weight, our idealism and our disinterested sense of justice. Are we willing to take the responsibility that now rests on the souls of those men in Europe who refused this invitation in 1914?

Tin Mining in Malaya

Much interesting information is contained in the annual report of the Chief Secretary of the Federated Malay States for 1918, regarding tin mining, which is second in importance only to the rubber industry. British Malaya occupies the first place in the world in the supply of both of these important commodities, with Singapore as the world's greatest market.

In his report for the year 1918, the Chief Secretary says: The revenue, excluding special war taxes, derived from mining amounted to \$7,931,715, an increase of \$2,312,087. This was due to the high price of tin for a great portion of the year. The total amount of tin exported during 1918 was 37,370 long tons, as compared with 39,833 long tons in 1917. The average yearly export for the past five years was 43,376 tons. An appeal was made to the mining community to make every endeavor to increase the output of tin in view of the needs of the Allies in connection with the War, but the output decreased. It has frequently happened before that the result of a high price for the metal has been a decrease in the output. The reasons are simple. The mining laborer finds that he can earn as much as he wants with less exertion, and the careful mine-owner finds that he can profitably work low-grade ore which it would not pay him to work when the price of tin is low. The richer ground is, therefore, held over. One large mine, which is capable of maintaining a steady output, reduced the output from 2616 tons in 1917 to 1878 tons in 1918, and doubtless the main reason for this large reduction is that low-grade ground was being worked. Possibly, however, there were other reasons which contributed to this, although to a less degree.

With the sudden termination of the War in November the need for an increased output disappeared and stocks of tin were far in excess of the world's requirements. There was considerable feeling among the mining community when this second crisis in 4½ years came upon them. The first crisis could not have been foreseen, but it should have been realized that there must be an end of the War, though the exact date could not be foretold. The market for tin was closed and it became necessary for the Government again to purchase the output. At the time of writing there is still no market for tin. America has prohibited the import of Eastern tin and the Government is still buying.

The average price of tin in 1918 was \$85.52 per picul (133½ pounds) of Straits refined tin. The highest price was \$103.61 on August 3, and the lowest \$66.75 on January 4; the average price in 1917 was \$61.74. The Imperial government assumed control over tin and appointed buying agents in August when the price was about its highest and rapidly reduced the price until it reached \$67 per picul. The Imperial government ceased buying in December. It was at \$67 that the local Government decided to buy, and this price was maintained till after the Chinese New Year (February 1), when the Government buying price was reduced to \$65.86, and eventually to \$56.78, at which price it now remains.

The Relation of Health to Work

By THOMAS DARLINGTON

*We have come a long way in the last 40 years. I go back to when I commenced the practice of medicine, and I am in my 40th year of practice. The annual death-rate in this city when I had an office down in West 30th St. was 35 per thousand, nearly 36. Now, it is only a little over 13, because of discoveries in medicine, just as wonderful in medicine and prevention of disease as all the other discoveries that have come along in the last 50 years—the great wonders in electricity, means of locomotion, everything that we have today. Likewise medicine has opened a new field, particularly in prevention of disease. We have commenced to consider man in a different light. We know and have known for a long time that it pays to take care of an accident. Compensation laws have been enacted and we know that it costs something every time a man loses his finger. It used to be, even 10 years ago, that in some of the steel plants when men became injured the wound would become septic in fully 50% of the cases, 500 out of a thousand. Today in various steel plants, such as the U. S. Steel Corporation, Carnegie, Youngstown Sheet & Tube, only one in a thousand becomes septic, and in the Bethlehem Steel very much less than that. In the big plant at South Bethlehem in four years of accidents, taking every little thing into consideration, every little scratch, 50 or 60 cases a day, there have been only two cases of septicæmia.

Now we have come to another time when we find it pays to take care of the human machine to even a greater degree and in other ways. The deaths in the army both from disease and those killed in battle are nothing compared to those who become ill and die in industry. Man is a machine. How is he usually cared for? Let me give you an illustration. Here is a man who has made his pile. He goes home and says, "Wife, we have made a million. I have sold out the plant, we are never going to work any more, you and I, we are going to get a Rolls-Royce and we are going to motor out to California. We are going to run the motor slowly across the country and will see everything, and we are going to take our ease the rest of our life; but you know, of course, we will come to places where we will find it very difficult to get water and in other places we may not always get oil, especially when we cross the desert, so I'll tell you what we will do. We will take the machine out next week and take it out two weeks without water and we will take it out two weeks without any oil and we will make it hard as nails." Rot, isn't it? That is something like the care that a soldier in the army is supposed to be given. I have just come out of the army and I know something about it,

having the contagious diseases of fifty thousand men to look after, and it is the same care that is often given to men in industry. We treat them just like that man treated his machine. We think that hardship hardens a man and we look at the brown faces of the men that have come from abroad and say they are "hard as nails," but I am thinking of all those that went down, of many deaths, for which there seemed to me to be no necessity. Given a well man and you have absolute control of him. Why should he get ill?

From my standpoint, efficiency depends primarily on health. The German philosopher, Münsterberg, said it depends on a man's psychology, but what does psychology depend upon? Flow of blood to the brain, and flow of blood to the brain varies with all kinds of things, with the weather, the pressure of the barometer. Suppose your liver is out of order. Don't things seem to have a green and yellow hue? If you don't think psychology changes, let a man try six of these [indicating a cocktail] and see whether his psychology changes. Instead of feeling poor, you own the world. Psychology depends on health. Efficiency depends on health, and it pays to take care of a workman.

As a matter of fact, illness in industry already has an effect on operating cost that is far from being realized. Whenever a man is absent from his work because of illness, it is usually necessary to have someone else take his place. The substitute, as a rule, is a less efficient worker; he makes a smaller output for the day's wages, he spoils more raw material, he requires more supervision from the foreman, who is thus distracted from more important work, while procuring and sending the substitute to the work needed involves a cost and usually a delay in the operations. I have seen a business fail because it depended on one man, the superintendent, and he got typhoid fever and there wasn't anybody to run the business.

Efficiency depends on health, and health depends on three things: the care that a man gives himself, the care that industry gives him, and the making and enforcing of health laws, city, state, and national. What can people do for themselves? Before I take up that question, I have been told that some of the members here are interested particularly in the question of fatigue. I happen to be chairman of the Committee of Fatigue of the Council of National Defense and I want to talk to you about how people get tired. Fatigue means much to a worker. If a person catches cold it is when he's tired; if you catch an infectious disease it is when you're tired. Fatigue lessens resistance to disease. Fatigue is the one great thing in this world that we want to avoid. What makes people tired? Work? No. Very seldom. It

*Abstracted from an address delivered before the Mining and Metallurgical Society of America. For many years Dr. Darlington was Commissioner of Health in New York.

isn't work. Cold will make you tired. It makes every cell in the body work fast. A great many things make fatigue, but seldom work. That is a different idea from that which most workmen have.

I once ran for a political office in this town—I was defeated—Borough President. While I was campaigning at that time, standing on a soap-box, I heard a man say, "My friends, the time is coming"—this was down on the East Side—"the time is coming when we are going to have a three-hour day." Think of it, a three-hour day, because they believe, like all the Bolsheviks, that work is the curse of the earth. That isn't true. How do people get tired? Now, to know that you have got to understand a little physiology. We must understand the body. Every part of the body is in motion all the time. When any part isn't in motion in the body it is dead. You are manufacturing heat, you are getting energy all the time. That comes from your food. Food goes into the body, is taken up and stored in the body, and you have it to use. It is then burned up by means of the oxygen which you breathe. All the time in the body there is a breaking-down process, all the time there is a building-up process.

I move my arm like this [illustrating by bringing the forearm up]. What has happened? The will sent an impulse into this muscle, the biceps, that is attached to the arm. It contracts. As the muscle contracts up goes the arm, but I have used up some energy in this muscle. Energy comes from something. What is it? Something in the muscle— $C_6H_{12}O_6$. What is that? Dextrose. The $C_6H_{12}O_6$ becomes $2(C_3H_6O_3)$. What is that? Lactic acid. If I keep on doing that pretty soon that muscle gets sour—tired. What becomes of the lactic acid? Burns with the oxygen, finally comes out CO_2 and H_2O , and goes out through the lungs and the kidneys. Very simple, isn't it?

First we use up all the sugar. All the starches go into sugar. We store that in the liver. That is the coal-bin. Then when you have used up all the sugar, you use up the fat. That is much more complicated. After you use the fat in the muscle you use the muscle itself. How do people get tired? We will suppose they have no sugar in the muscle. Well, then, you haven't anything to work with, have you? Then you are tired. It is a great deal like the energy developed in a boiler. You have got to have the coal. What a difference whether you get slaty coal or whether you get Pocahontas. A wonderful difference, isn't there! The next thing necessary is a draft. If there is no draft it doesn't burn well. And the next thing is to get rid of the ashes of waste.

Energy depends first upon the food you eat, the kind of food, whether the system can use it or not, whether you digest it and store it away. Next upon the oxygen which is carried by the red blood-corpuscles, the hæmoglobin in the blood. The first thing then in the question of fatigue depends upon the character of the food that people eat. Very few people understand that, and so far as the workmen are concerned few of them or their wives know anything about feeding the man, and any old thing goes in the lunch bucket. One day I opened 250 lunch-

boxes in a Carnegie steel plant. The first bucket opened contained a whole boiled cabbage. How much $C_6H_{12}O_6$ did he get to use in the muscle, how much energy could he develop from that cabbage? It was good for one thing. Perhaps I will tell you a little about that later. The next man had nothing but cake and honey. He got all the $C_6H_{12}O_6$, but what did he get to make up for the loss of protein and muscle? Nothing, and he was thin.

But it is not alone a question of the kind of food that he gets. Does the man digest that food? Was it mingled with bacteria in the mouth and fermented in the stomach? Did the sugar split up into acids in the stomach before it got into the muscle? Don't you see that energy is the converse of fatigue and fatigue the converse of energy? Energy depends first upon food and its digestion, its absorption and utilization, and next how are you going to burn it? It is burned with the oxygen. Take a drop of blood from a man and examine it under the microscope and we find that he has a 5,000,000 blood count. Yes, that is a good healthy man. It is up to normal. The next man we take we find he has 2,500,000 blood count. Doesn't it take twice as rapid a circulation of the 2,500,000 to carry the hæmoglobin as the man with the 5,000,000? Yes, twice as fast the blood has to work because he has anæmia. What does anæmia come from? Dark unventilated rooms, infectious disease, poor food, lack of movement from the bowels, bacteria in the mouth, in the tonsils.

Next get rid of the ashes of waste, and how do we do it? The waste is all through the body.

There was an old professor in Turin who watched quails migrating across the Mediterranean; some of these he caught that were very tired after they flew across the ocean and he picked them up. They were too tired to prevent his picking them up. He took them home. Next year he caught some more and he took the tired quails and took the blood out of them and put some of this blood into the quails that weren't tired that he caught the year before and it made them tired.

How do you get rid of this waste? Well, the blood takes it up and takes it away. If a person drinks a great deal of water that helps. If you have a shower-bath you drive the blood inside and then it returns to the surface again and that helps and soon you get rid of all fatigue and the waste goes out through the kidneys. But other waste produces fatigue. Sometimes a person does not have a regular movement from the bowels, because instead of having modern water-closets you find places that you couldn't dignify as even privies—simply an old bar. One man made them as bad as he could. Why? He didn't want the men to linger there. Well, he lost lots of money, and I will show you how. In fermentation we have bacteria in the bowels all the time. In fermentation, particularly of protein food, you develop certain poisons. These poisons are known as indol, skatol, mercaptan, and certain phenols. The last develop particularly from eggs and milk. The most common poison found is indol. That is absorbed and becomes a sulphate in the system and that is known as indican. When you have a urine ex-

amination you see so much sugar, so much albumen, and so much indican. The sulphate of indol is indican.

To show you how it works and how a lack of movement of the bowels produces fatigue, a man gets up in the morning and he hurries, he hasn't quite time to have a movement at that moment. He goes to work, doesn't go outside, he has got a lot to do, and the little amount of liquid material around the movement in the lower part of the bowels is absorbed and the desire to have a movement passes off. What has happened? Let's see for a minute. [Draws sketch on blackboard.] This is a stand. This is a cylinder which is smoked. Here is a short arm fixed. Here is a long arm on a pivot. We put in here a muscle, the back of a frog's leg, called the gastrocnemius muscle. We now put an interrupted current in here and the smoked cylinder is timed to revolve as you put an interrupted current through. The muscle contracts. That pulls up this arm so that on the cylinder you get a record. We take a muscle and into this muscle we put a few drops of salt and water with a hypodermic syringe and take the record. Now, if we can get two muscles from the back of a frog's leg, get them out just exactly the same, and we want to see the difference in the muscles we take the first one with an injection of a little salt and water and this is the record that we get of that muscle [illustrates on blackboard], taking about every fifth mark and finally the muscle stops contracting; it won't go any longer; it is all used up; it is dead. Now, we will take a little indol from a movement, a fraction of a drop, and this time put that in with the salt and water and inject that into the other muscle. What do we get? The muscle stops work in a little more than one-third of the time. That is the man's lifting capacity. The man who hasn't had a movement of his bowels in the morning, absorbs that material through his system. The man has only about a little more than one-third the efficiency of the other man so far as his actual muscular capacity is concerned. If the one man is worth \$6 a day, this man is worth \$2.30. That is putting a movement of the bowels into dollars and cents.

Don't you see that fatigue doesn't depend entirely upon the amount of work that a man does? It depends, first, upon the energy he receives from his food and, second, upon the quality of blood that is carrying the oxygen to the tissues. So much so that when he gets up in the morning he puts up his hands to Heaven and says, "Thank God, there is another day to work." He works well because he has the energy, and he loves it.

Once when I explained this to some of the steel people, I said that if I was building a steel-mill or any other kind of a mill the first thing I would do would be to build a marble water-closet so as to get everybody to go in. So one of the steel-men did that and all the Italians went in there and ate their lunch. You see, there are some other points which you must consider besides the mere health of the men. Once in a while there comes a slip.

About the efficiency of the man himself, don't you see it goes into every phase of that man's life?

Before the War we were just approaching these things.

Back in the Old Testament it tells about the Jews when Nebuchadnezzar was outside the walls and had his great army there and his banners and they all gave up everything they were doing that they didn't think was just right. And some said "What about these slaves of ours?" and they freed them all. But one day they saw the banners of Nebuchadnezzar in the early morning disappearing in the far distance and when the danger was past they said, "Where are those slaves of ours?" and again they made them slaves.

While the War was on it was our winter and the leaves were off the trees and we could see a long distance. We must continue to see that long distance. We can't go back to our ante-bellum days. We have got to go forward. We have had a vision of what is right and we can no longer go back, but must do everything that we can for those who are ignorant and less favored by birth in station of life.

Let us now take up one or two other things. I said that a man's efficiency depends upon what he can do for himself. Now, among the many things of personal hygiene besides the question of taking baths, care of the eye, the ear, and the nose, and everything else of that kind, and regulation of a man's meals, there are simple things like the brushing of teeth. How many workmen in the factory brush their teeth every day? To be efficient men they must brush their teeth seven times a day. Do you suppose any of your workmen know that? Not one of them. Why must they do it? Let's just look at it. It is a simple thing. The manufacturer is interested in it because of his output. If I had a factory I'd make every man a present of a tooth-brush. It was done in the army. I helped to take care of 50,000 men and had to talk to them. Pneumonia killed some of them because they didn't brush their teeth. What did they do with the tooth-brush? Used it around the edge of the shoes to get the mud out. What is the first thing about the teeth? Well, we need them for enunciation. In the army it was absolutely necessary that orders should be distinct. The chewing of food means a lot in energy. Still, that means little compared with some of the other things. Personal appearance is one. We all like beauty. You cannot imagine a beautiful woman without any teeth. But let that go. In the mouth are 48 varieties of bacteria. If you chew the food without brushing the teeth you swallow those bacteria and the food ferments in the stomach and often it passes the quarantine of the stomach and goes down to the bowels.

There was an old doctor in 1822 who lived on the shores of Lake Champlain—Dr. Beaumont. He had a patient that was brought to him by the name of Alexis St. Martin, who had a hole shot in his stomach, and the doctor used to put food in this patient's stomach and watch it digest. He found that gastric juice would keep indefinitely under ordinary circumstances but that if he swallowed much saliva it spoiled quickly. Why? Because the saliva was full of bacteria. Do you know that in the army in the grippe epidemic very few if any died from grippe? They all died from pneumonia. Why? There

are four types of pneumonia germs. Nearly all died of the fourth type. That is a mouth bacteria. They got the grippe and then the pneumonia bacteria that inhabited their mouth and grew there went into the lungs and killed them. If they had all brushed their teeth regularly, many of them would have lived. Many, very many of the 600,000 people that died in the United States would be alive today if they had brushed their teeth in that epidemic. But that is very little compared with the other thing. A tooth dies, but you do not always know it. At the root of that tooth there comes a small abscess. From this bacteria and the toxin are absorbed in the system. Just the same as in the tonsils. The tonsils and the teeth make over 90% of our infectious diseases. The poison may go into the heart, producing vegetation of the valve; or go into the kidneys, and make Bright's disease; or go to the bladder and make inflammation of the gall-bladder. Nearly all rheumatism comes from bad teeth.

Do your workmen know that anæmia, the loss of the red blood-corpuscles that carry the oxygen to the tissues, is often due to abscesses at the roots of the teeth or old roots in the mouth? Have you got a dentist in every factory pulling out these old roots? No. The first thing I did at Hog Island, where I was consulting surgeon, was to put three dentists there. They said a great deal of money was spent there. Thank God, I had an opportunity to demonstrate some things that had never been done before.

Deaths from shock and hemorrhage! Men die in a few minutes from shock, but if you have blood to inject into them right away you often may save them. We hired three men, and gave them \$1200 a year apiece and fattened them up and kept them raking leaves, and when a man got injured we took some blood from them and injected it into the injured person. We saved three men worth \$5000 each according to the Pennsylvania Compensation Law the first month. \$15,000 against \$3600 in the first month!

How about washing of hands? It is from dirty hands that bacteria get into the mouth. What does the surgeon do? Simply wash his hands? No, he puts on rubber gloves, even after he has put his hands into absolute alcohol with bi-chloride. I remember when I was a boy going to college George Francis Train sat in the park. It was back in 1874 and I remember asking old Train, "Why won't you shake hands with anybody?" and he said, "I don't know where a man's hand has been last." There is something in it. Take the case of 'Typhoid Mary'. How did she give typhoid to 28 different families? Because she had typhoid germs on her hands. Very little, but it gave disease. Does every workman wash his hands before he eats lunch? There is something else that workmen generally do not know. That man that was talking about the three-hour day, did he know that Scripture says, "By the sweat of thy brow thou shalt earn thy bread?" The man that doesn't do it doesn't live as long as the worker. To live long you have got to work. Work leads to longevity. The rich man of to-

day, what does he do? Does he do like the man in the Bible who said, "Now, soul, we will enjoy ourselves and eat, drink, and be merry?" The rich man today builds an 18-hole golf-course and works like the devil to keep his health. Work doesn't hurt anybody.

That is what we have got to teach the workman.

We have in the neck a gland called the thyroid. We have more important ones over the top of the kidneys, little thin glands called the adrenals. These are like the governor on an engine. They control our circulation. If you lose those glands you die. These adrenals throw out a powerful drug. I know of two men at the front where a big shell burst and adrenalin was thrown out so that every hair stood on end for a week. A grouch, grief, anger, or worry are ruinous to the body. They cause adrenalin to be thrown out. But joy, love, laughter prolongs life. What does that mean? It means that we must teach the employee cheerfulness; that every man shall find in his daily work his greatest happiness. Just as God Almighty found happiness in the creation of the earth, we, made in His image, must find our happiness in our daily work, no matter what that work is.

I have simply given you an illustration of the care of the human machine. I have put before you the money side of the question. We have to do that with a corporation. In all the big plants of the steel industry throughout the United States many million dollars have been spent along these lines, in education of workmen, teaching them to wash their hands, to take showers, to do all these different things, and providing facilities for them and their families. Wonderful work! The steel industry today leads the world as a great industry. I am not saying that to the disparagement of others as far as welfare work is concerned, but it is the largest industry.

We now come to another side of it, and that is this: Cain's answer by the Garden of Eden was, "Am I my brother's keeper?" The Bolsheviks and the Socialists have used that for a great while, this cry of the brotherhood of man, which means nothing to that class. When I was in the Department of Health we had 187 laws. They all meant one law. How can you translate them into one law? The man that loves his neighbor won't spit on the sidewalk, he won't sell his neighbor bad food, he won't let smoke come out of his chimneys, he won't let his child with contagious disease run around and spread the disease. That is the thing that we must teach workmen, the love of their neighbors. It is a great thing to relieve suffering. It is a far greater thing to relieve penury and crime, so we can say with Abou ben Adhem, "Write me as one who loves his fellow men."

AS A DOMESTIC FUEL most lignites are unsatisfactory on account of their comparatively high sulphur content, and in Canada they have proved an unsuitable substitute for anthracite, for which many household stoves are properly designed. In the same country the use of lignite for firing locomotives has been forbidden by the railway commission on account of its property of emitting dangerous sparks. Experiments so far made with the object of briquetting lignite have not been successful.

The Federal Taxation of Mines—II

Methods of Mine Valuation

By L. C. GRATON

As already pointed out,* the latest revenue law provides three ways of arriving at the value of mining property, namely:

1. The cost, if purchased on March 1, 1913, or later.
2. The market-value as of March 1, 1913, if purchased earlier.
3. Re-valuation in either of the other cases, provided since March 1, 1913, or since purchase subsequent to that date, new discovery in unproved ground results in a value disproportionate to the value prior to discovery.

Most of these methods are methods of indirection. The method or methods which I trust may be followed in the present attempt to apply the tax laws to the mines should be methods as direct as possible, that is, engineering methods. Stock-market quotations may, under some circumstances, afford a rough check on valuations arrived at by more direct and reliable methods, but in themselves can ordinarily be given little weight.

Mines, since they are of diminishing value in proportion as they yield return, have to be valued by estimating the total earnings and the total life, and from these working back to such a valuation as will afford a demanded annual rate to cover profit and risk and will be itself returned at the end of the estimated life by a sinking-fund accumulated from annual depletion increments. This present-value-of-eventual-earnings method is, so far as I am aware, the only definite method of mine valuation expounded in text-books on mining or in treatises on mining investments. Of necessity, this present-value method of mine valuation must be the corner-stone on which the work of the Revenue Bureau must build. Mines vary so greatly in character and conditions that no single basis of valuation can be applied indiscriminately to all without grave error in the case of many. Clearly, either each mine must be considered in unlimited individual detail, or else classes must be established into which mines of essentially similar character and circumstances shall be grouped and these classes handled as if individuals themselves. The latter scheme, that of grouping into classes, is likely to afford the best practical solution because the single-mine method would require a degree of detail and an amount of time that would render the problem almost hopeless.

Unquestionably the fairest and most defensible method of mine valuation is the present-value method, provided the essential factors that enter into the computation are reasonably well known or can be arrived at with fair reliability. Most coal mines, many iron mines, the por-

phyry copper mines, and perhaps a few others can be valued pretty directly and satisfactorily by this method, because more of the necessary information is available for them than for any others. For them, any other method is likely to be less reliable and less fair. Obviously, also, valuations so determined for such mines will be the most reliable group of valuations of all that will be established. Therefore, it seems to me logical to value those mines by the present-value method, to which it will directly apply, in order to establish certain standards or yard sticks by which to determine valuation of those mines for which less and less of the necessary data are available.

Let me illustrate why this method of comparing with a standard is desirable and permit me, if you please, to use by way of illustration both here and hereafter examples from the copper industry with which I am most familiar. A given porphyry copper deposit may be producing 100,000,000 lb. per year at a gross profit of 6c. per pound and may have an indicated life at that rate of 30 years and a past history of successful production behind it of 8 or 10 years. A limestone formation may likewise be producing 100,000,000 lb. of copper per year at the same gross profit of 6c. per pound; it may have a successful producing record behind it of 30 or 40 years, yet have actually developed ahead only, say, 3 years' ore supply. Is the porphyry mine to be valued on the 30-year life basis and the mine in limestone to be valued on the 3-year life basis? Obviously not. How, then, is the limestone deposit to be valued? Will not its true value be best arrived at by applying certain properly-determined factors to the value indicated for the porphyry mine—factors that will take into account its greater risk in ore continuance or life persistence and that will make needed provision for such other changes or differences as past experience has shown are likely to arise as between limestone mines on one hand and porphyry mines on the other?

If this conclusion is sound, it follows that the present-value method will be the keystone of the valuation section's work and that a series of modifying factors must be established which will bring other mines into proper balance with those to which the present-value method can be applied directly and without modification. Right here, in my opinion, lies the keynote and crux of the entire valuation job. If a series of factors or indexes can be established that are practical, effective, and fair, the problem is going to be simplified immensely. Let the mining companies contribute, through their technical staffs, all the help that they possibly can.

*In the preceding article, appearing in our issue of October 11.

If the present-value method is to be extended to the great majority of cases of valuation, as just indicated, there arises a multiplied obligation that it be applied in an absolutely logical and proper way, and with all reasonable exactness. Inasmuch as the method, at its very starting point, relies on factors, such as tonnage and yield of ores, which are necessarily but estimates and approximations at best, it might seem natural to conclude that all subsequent steps in the process could, with entire permissibility, be of only corresponding accuracy—that, indeed, any attempt to introduce greater refinements than those imposed at the outset would be futile and absurd. That is the conventional theory of error. Perhaps it is justifiable and sound when the object is the attainment of a proper *average*. For the probability, or so-called law, of averages will ordinarily balance individual low results with corresponding high ones. But in dealing with this tax problem, we cannot be content with a fair *average*. We cannot satisfy A's complaint by proving to him that "B was let off correspondingly easy, so the thing evens up after all." The essential and reasonable accuracy of *each* individual result is important.

While it is, of course, unnecessary to defend the present-value method of mine valuation, it may nevertheless be well, in view of the responsibility which it may have to bear, to analyze with care what its consequences will be if used in the taxation program, and to indicate some of the considerations that in my personal opinion ought to be given appropriate attention in such an application.

The valuation engineers of the Revenue Bureau, as I understand it, are to answer the question of valuation that is comprehended in the imaginary situation of a prospective buyer, competent to measure mine-values and actuated by the hope of profit to be derived from mine operation, making an offer for a mine to the owner who is likewise competent to measure mine-values and who is under no obligation to sell except such obligation as arises from his belief that the offer made is advantageous to him.

Now the first question that a prospective buyer would want to determine is the security of his capital. He realizes that mining is a hazardous and unensurable business. Therefore, he demands a higher return on his money than he could obtain if he invested it in an ordinary manufacturing business or in a good mortgage. Since the interest rate must thus include both actual profit and compensation for risk, it is clear that the determination of the rate cannot be based on the mining industry in general as compared with other industries when, as a matter of fact, the degree of hazard varies greatly among different classes of mines; clearly enough different rates must be established for different classes. On these determinations as well as of proper interest to be credited on the sinking funds, much thought may well be expended.

Let us assume that our prospective buyer concludes in a given case under consideration that he should have 10% on his money each year, in addition to a depletion installment calculated eventually to return his capital

sum. As a matter of fact, regardless of whether he spends it outright or invests it in something else or places it, as theoretically intended, in a sinking fund for the positive redemption of capital, his annual depletion installment, if actually received, continually reduces his stake remaining invested in the risky mining enterprise; yet if everything goes well and his original assumptions on the basis of which the valuation was reached prove to be justified, he will be receiving a 10% return on his entire initial capital through the last year when only a small fraction of that capital is invested in the 10% risk and the major part has been used in some other way. In reality, therefore, he receives on the average distinctly more than 10% on the capital that is at risk.

Since the money still in the enterprise derives greater and greater interest return with time, it could, therefore, afford to carry greater risk during the late than in the early period of the investment. Clearly enough, in a going mine, purchased on the basis of proved and prospective ore, the early years would indeed involve less risk, while, as viewed from the beginning, the later years, necessarily relying on ore less positively assured, would entail greater uncertainty and hazard. The method and the facts thus appear to coincide in direction, and although it may be doubted if the risk mounts at the very end at so rapid a rate as the percentage of return is found to do, or if, on the other hand, the risk of the late middle years is sufficiently covered, it nevertheless seems likely that no more accurate coincidence can be established save by complex formulas which would be quite unjustified. Acceptance of the flat rate has behind it, furthermore, the support of accepted custom. Still another advantage is that, because of the rapidly increasing spread in the later years of life between, say, an 8%, a 10%, and a 12% flat rate of return, justification is afforded for employing, in the computations of present value, rates of interest that do not differ very greatly and yet make provision for a wide range of risk, as for example, a porphyry copper mine and a pockety silver mine.

Another phase of the present-value method which appears not to have been clearly set forth in any of the discussions thus far devoted to this subject, is that all the assumptions on which this method has been based and all the tables that have been printed as aids in applying it arise from the idea of equal annuities, and imply, in fact, that a given property will mine a fixed tonnage of constant average grade of ore throughout its history. All the computations as to life and all the interest factors involved rest on such assumption. As a matter of fact, these assumptions may apply to certain classes of property. They probably do pretty well apply to operations upon a given seam of coal tributary to a developed industrial district. It was to such a condition, I believe, that this fundamental method of valuation was first applied, namely, the English collieries. But the assumptions of constant grade of ore and a fixed tonnage per year surely do not apply to many other mines in which this method could otherwise be advantageously used. Many mines, like the porphyry coppers, which have great reserves of ore established by exploration, will through

choice, and must indeed, of necessity, work richer ores during their early years and depend upon leaner and leaner ores as their life progresses. This will tend to bring realization of eventual earnings into the interest market at an earlier date and will increase the present value of the property. Likewise, such mines possessing enormous ore-reserves are likely to continue in future as they have done in the past to increase their scale of operations and their rate of output so that the actual life of the mine will be shorter than is indicated by any present rate of exhaustion.

Perhaps some justification should be given for the conclusions that have just been stated. First, as to the hypothesis of declining grade of ore with time. Almost every influence combines to cause mining of a great deposit to begin on about the richest ore it contains. Some of these influences are:

(a) Most deposits of the class embraced in the long-life-ahead mines decrease in value outward and downward.

(b) Most such deposits are explored first in their upper central portions, that is, where the ore is best and where surface indications were probably most attractive, and only with time are the explorations pushed to the lateral and bottom limits of the deposit.

(c) It is natural that actual operation, that is, ore extraction, shall begin approximately at the point where exploration began. Indeed, commonly, extraction has already been going on there before the marginal portions of the deposit are completely developed. It takes time to gradually extend operations laterally outward to the margins, where the lower-grade ore generally lies.

(d) In several instances already passed into history, the figure regarded as the basic economic limit of ore-grade a few years ago has now been so lowered that what was 'waste' then, is 'ore' now.

(e) Regardless of improvements in methods and processes, there will always be a tendency to make sure now of at least the better grades of ore, and to go somewhat more slowly with the lowest grades, in order that improvements in technique may come to light that will simplify the problem, or that the difficult job may be passed to someone else.

The foregoing considerations are amply confirmed by experience. The same conclusion is indicated by the general changes in ore-grade for the country as a whole. For example, definite statistics as to average yield of copper from all copper ores produced in the United States were first compiled in 1906 and are now available through 1916. These show that the tonnage of copper ore mined has increased from 18,000,000 in 1906 to almost 58,000,000 in 1916, and that in the 11-year interval the yield of copper from this ore has declined from 2.5% to 1.7%. If the great tonnage of low-grade native copper ore from Michigan be excluded, because it has stood nearly stationary in percentage yield (declining in the period only from 1.26% to 1.08%), the remaining copper ores have fallen from a yield of 3.56% in 1906 to 1.86% in 1916, a drop of almost half.

Changes of similar nature are indicated for the other principal metals.

The importance of these factors of declining grade of ore and increasing rate of production becomes very real in the case of mines of assured long life like the porphyry coppers, the first factor particularly in those deposits in which the geological process of secondary enrichment is involved. Let us suppose that a given mine has developed an immense tonnage as follows:

| | | % |
|--|------|---|
| 20,000,000 tons expected to yield..... | 2.00 | |
| 40,000,000 " " " " | 1.75 | |
| 60,000,000 " " " " | 1.50 | |
| 80,000,000 " " " " | 1.25 | |
| 100,000,000 " " " " | 1.00 | |

Total 300,000,000 tons of average yield..... 1.33

Let us suppose further that this deposit is now being mined at the rate of 5,000,000 tons per year, indicating a life at that rate of 60 years. Assuming an 8% return on the purchase price and redemption of capital by a sinking fund compounded annually at 4%, the indicated present purchase price of \$80.00 worth of eventual total earnings is \$15.84. Such would be the present value indicated by the tables of Inwood, Hoskold, and others.

But if we assume that the richer ore is mined first and the lowest grade ore mined last, the indicated present value becomes \$19.77, or an increase of 25%. If in addition we assume that the present rate of output of 5,000,000 tons per year will be increased each year, say, by 4%, which indicates a doubling of mill capacity in about 18 years and a tripling of capacity in about 28 years (surely a conservative assumption for porphyry deposits), the life of the mine changes from 60 years to about 31½ years. The present value or indicated purchase-price then becomes about \$22.40 by increased capacity alone, or about \$24.75 by combination of increasing capacity and declining grade, or respectively 41% and 56% greater than the value indicated by the tables now in general use.

It seems to me that the factors of rate of production and grade of ore will have to be given serious consideration and that statistics will have to be compiled that will show how mines of various classes are likely to change their rates of production and how the ore that they mine is likely to change in grade. Then certain groups will have to be established to which a scale of factors indicated by these past-history statistics will have to be applied.

In arriving at a fair market-value as of March 1, 1913, one is supposed to take into consideration only the facts that were then known or that could have been then known had one endeavored to learn them at that time. The question may therefore arise as to whether it is fair to arrive at a 1913 valuation by applying to the standard present-value method of mine valuation modifications which have not been proposed until 1919. In my own opinion, however, there is sufficient justification for using those modifications that are consequences of taking into account changing grade of ore and changing rate of production.

In arriving at valuations by the present-value method, certain of the data must originate with the mining company, namely, tonnage and grade of ore, percentage of extraction, and cost and rate of production, for these various factors either are direct consequences of the nature of the mineralized ground which the company owns or are results of the policy and methods which the company chooses to apply. Of course, they will all be subject to check by the engineers of the valuation section of the Revenue Bureau. There is one necessary factor, however, which must come from other sources than the company concerned, namely, the probable selling-price of its product over the period of indicated life of the property. That the selling-price is a factor of utmost consequence in the computation of present value has been emphasized by previous writers. It therefore seems to me that careful and detailed research must be put upon this subject when so vital a job as valuing all the profit-making mines of the country is to be faced.

A matter upon which all possible illumination is desired from mining engineers and geologists is the proper handling of 'probable' and 'prospective' ore in the computations of tonnage. My own feeling in this connection is that the decisions reached must be in accord with a thorough understanding of ore deposition and occurrence rather than rest on any arbitrary or conventional limitations and rules.

The clause in the latest tax law which permits revaluation of property if discoveries made by the taxpayer have caused a real change in value, is clearly going to be difficult of application. Without endeavoring at this time to indicate either the present attitude of the Bureau on this subject or my own opinions regarding it, I wish to emphasize that suggestions from the mining industry as to the application of this discovery clause will be welcome in Washington and will undoubtedly aid in the solution of this important question. Particular attention may well be directed to these questions: What is meant by discovery of a mine, what constitutes discovery according to that meaning, and when is such discovery achieved or completed?

Question has been raised as to how or at what rate depletion is to be allowed, for instance, whether coincident with the exhaustion of the deposit, or at a faster or slower rate. This is another of those matters upon which professional advice will be welcome. In the meantime, I may confess that the plan of allowing depletion in direct proportion to the actual exhaustion of ore seems to me most equitable and simplest of application. In this connection, it may be pointed out that if the coincident rate of depletion is adopted, the actual depletion allowances should be computed on weight of metal actually produced rather than on number of tons of ore, assumed to possess average grade, mined during the year.

The remarks thus far made with respect to valuation are related primarily to the relation between mine-values and depletion deductions. The matter of proper depreciation allowances on physical property must also be decided and in this connection an effort will be made to determine the intent of the law with respect to those

three main factors ordinarily comprehended in the inclusive term depreciation, namely, physical wear or decay, obsolescence, and inadequacy. Also effort will be made to settle on a sound principle of depreciation, that is, to decide as between one of the several methods now current, such as the straight-line method, the reducing balance method, or some other. Due consideration ought to be given to the fact that the usable life of equipment may outlast the life of the property on which it is to be used and a correspondingly rapid rate of depreciation therefore allowed from the start.

The excess-profit tax raises problems which all of us might well wish to escape, but which nevertheless must be faced and solved. No effort will be made in this paper to go into its details, but I may express the conviction that the assistance which the valuation engineers will afford in arriving at the fair quantities to be taken for invested capital and paid-in surplus for the mining industry will necessarily arise from the sound and accepted economic theory that in this hazardous industry, "occasional great gains to lucky or shrewd investors must be accepted with equanimity; a policy" of control that is "too grasping over-reaches itself."[†] For, quite outside any ethical questions that may be involved, this practical situation has to be faced, that taxes which take up to 80% of net income must be applied with due consideration of the necessity that profit-making industries must survive in order to supply the heavy taxes that will apparently be required for years to come. To whatever extent is proper, also, account should be taken of the fact that the pre-war average of earnings of the mining companies was on a higher percentage level than the earnings of ordinary enterprises because as already emphasized those earnings include cost of insurance in the one instance but not in the other.

Quite apart from the direct considerations of the subject of Federal taxation of the mines is a matter to which many of the mining companies have already, no doubt, given attention, namely, the effect of the Federal tax policy upon State, county, and local taxation. Deliberate valuations must of necessity be applied by the Government to most of the profit-making mines and other producers of natural resources in the country. To no other group of industries will such official and conspicuous valuations be applied. It may easily follow, therefore, that the true values set upon mining property, which are likely to be higher than most previous values for local taxation purposes have been, will result in the mines of those regions where the property tax prevails carrying a disproportionately heavy part of the local taxes, for the reason that all the other property except mines will not be brought up correspondingly to its true market-value level. In securing the benefit to be derived from full and fair valuation of their properties for the Federal income and excess-profit taxes, it is to be hoped that the mining companies will not suffer injustices arising nearer home, and it is to be desired that the local tax commissions may be brought to see this matter in the proper light.

REVIEW OF MINING

ARIZONA

COPPER PRODUCTION FOR SEPTEMBER.—DEVELOPMENT AT MORENCI.

DOUGLAS.—The Copper Queen smelter led in the output of copper for September for this part of the State with 8,600,000 lb., which is about half of the high point reached before the Armistice. An important event expected during October is the opening of the power-line between the smelter power-plant at Douglas and the power-plant of the Copper Queen branch of the Phelps Dodge Corporation at Bisbee. The Calumet & Arizona plant here produced 4,542,430 lb. of copper during September. The acid plant worked to capacity, producing between 5000 and 6000 tons of acid for the use of New Cornelia.

BISBEE.—Work on the site of the Copper Queen's 4000-ton mill is being pushed with a force of about 400 men. The steel contracts and machinery contracts have not been let as yet, but are expected to be awarded soon. The plant will handle the ore from Sacramento hill by a combination of flotation and gravity concentration. It is hoped to have it completed by July 1920, when it is anticipated that the Sacramento hill orebodies will be sufficiently developed to maintain steady shipment.

MORENCI.—Underground development has been started by the Morenci branch of the Phelps Dodge Corporation to prove its orebodies. Within the next six months it is expected that development will reach such a stage that the company will be able to figure with certainty upon its future activities, although the work now planned will require at least a year and a half to complete. At the end of six months it can be determined definitely, it is believed, what sort of mill will be necessary and what changes should be made in the smelter. The company is endeavoring to complete an arrangement whereby a number of its older employees, who are unfitted for hard physical labor, can be taken care of during the period of the shut-down of the mill, smelter, and mine production divisions. Leases in which the lessees can make a comfortable living with small exertion are being arranged for them. Many of the men formerly employed in the divisions now idle can be used in underground development, but many others will be compelled to seek work elsewhere.

HUMBOLDT.—The report of the Consolidated Arizona smelting company shows conditions are improving in this part of the State. From the Blue Bell and De Soto mines of the company 12,000 tons of ore was shipped to the Humboldt reduction works during September. The

concentrator handled 7900 tons of raw material and the smelter proper treated 7000 tons of new metal-bearing ores and concentrates. During the month 600,000 lb. of copper in bullion was shipped to the eastern refineries. The majority of this copper was obtained from the company's properties in Yavapai county.

TOMBSTONE.—September exceeded any previous month in the history of the last two decades in this district for the amount of ore removed from mines under lease. Between 90 and 100 carloads of silver ore were sent from here to the smelters. There are now more than 100 lessees at work here, most of them attaining excellent results. Several new leases are expected to be in operation before the end of October.

JEROME.—Some extremely interesting ground is believed to lie about 160 ft. ahead of a drift being driven south from the west cross-cut on the 1200-ft. level at the Gadsden. If the cross-fault holds its course, it will be encountered at approximately that distance from the face of the south drift. The cross-fault does not show on the surface, and the east cross-cut encountered it unexpectedly. A broad belt of gouge as soft as putty was intersected approximately 160 ft. from the shaft. The material carried much water and is considered a likely formation in which to find ore; hence the anxiety to find the junction.

TUCSON.—The college of mines of the University of Arizona has a larger enrollment this year than ever before, not only in numbers but in the territory from which the pupils were drawn. The States represented by the men studying under Dean G. M. Butler are: California 7, Texas 6, Illinois 4, New York 3, Michigan 3, Oregon 3, Colorado 2, and one each from Washington, Ohio, Kentucky, New Mexico, Georgia, Alabama, Tennessee, South Dakota, Pennsylvania, Wyoming, Iowa, and North Carolina. One student from China also has registered. Many of the men have studied previously in similar institutions, both in the United States and abroad.

COLORADO

CRIPPLE CREEK AND LEADVILLE.

CRIPPLE CREEK.—Output from the mines of the Cripple Creek district for September was curtailed by the labor shortage and lack of experienced miners, who have left for districts where higher wages obtain. The closing down of the Vindicator Consolidated Gold Mining Co.'s mill also served to cut down the tonnage. The Vindicator company has declared its regular quarterly dividend of

one cent per share, a total of \$15,000. The dividend will be paid on October 25 to stockholders of record as of October 15, when it is expected that G. S. Wood, the president for the company, will advise as to conditions on the Cripple Creek property and explain the shutting down of the milling plant. The total tonnage treated during September, together with smelting shipments, was 60,590 tons, with an average value of \$11.96 and a gross bullion value of \$590,255. Of this tonnage the Golden Cycle mill at Colorado Springs treated 24,000 tons of one-ounce ore and the Independence mill of the Portland Gold Mining Co., near Victor, 25,810 tons with an average grade of \$2.09 per ton. Smelting-grade ore shipped direct totaled 760 tons of an average grade of \$75 per ton. September dividends were limited to the distributions of the Cresson Consolidated Gold Mining Co.; \$122,000, and the Golden Cycle Mining & Reduction Co., \$45,000. The last named company paid on October 10 the regular monthly dividend of three cents per share, a total of \$45,000. The Cresson will suspend further dividend payments until mine conditions and funds permit.

The Lincoln Mines & Reduction Co. reports that the construction of its mill on Ironclad hill is nearing completion. A demonstration of the Gasche process, to be used at this plant, will take place inside of sixty days. F. G. Gasche, who has patented the process, is general manager for the company.

Citizens of Goldfield, including T. O. Roberts, city treasurer, and Abe Hawn, former mayor, have acquired title to vacant lots with the corporate boundaries situated on the eastern slope of Battle mountain, and are prospecting the ground by trenching. A shaft is also being sunk on what is believed to be the southern extension of the Harrison vein of the Golden Cycle system. The Portland company is cutting a station at the bottom level of No. 2 shaft on Battle mountain. This is 2283 ft. deep, 152 ft. below the Roosevelt Tunnel level connection with No. 2 shaft. The ore-shoot on the No. 2 Portland vein at the tunnel level has been proved for 1200 ft., and driving started south has shown ore still in the face. The Bonanza King on Gold hill, owned by the Midget Bonanza Gold Mining Co., has been leased to a local company operating under the corporate name of the Keystone Development Co. The property has produced rich ore from surface workings and will now be prospected from the 500-ft. level of the Midget shaft. The ore in Rose Nicol shipments is reported to be improving. A car of ore recently shipped by the Reva company, operating under lease, mined between the 800 and 900-ft. levels, brought settlement at \$25 per ton.

LEADVILLE.—Under the ruling of Judge Henry J. Hersey of Denver, which upheld the contention of Lake county, property having an assessment valuation of one million dollars will be added to the Lake county tax rolls. Under this ruling, Lake county's northern boundary will be moved to include the rich molybdenum deposits of the Climax district. The bulk of the property within the disputed area is owned by the American Metal Company, and the treasurer of the company in the past has paid taxes to the treasurer of Summit county at Breckenridge.

While Lake county is talking of bringing suit to recover back taxes, Summit county attorneys are preparing an appeal to a higher court. In addition to the mines, the American Metal Company owns a large mill at Climax, and the town is also within the strip, which is five miles long and one and one-half miles wide, containing six to seven square miles of land.

MICHIGAN

REVIEW OF THE METAL OUTLOOK.—PRODUCTION FROM THE MINES.

It is stated that no effort to increase production in the copper mines will be made this winter. The present indications are that the output of copper for the year 1919 will be the lowest it has been since the strike. If the total is to reach 150,000,000 lb. there will have to be a large increase in output for the fourth quarter of the present year. No such increase is expected, although it may easily come if there should be any sign of a normal demand for the metal.

Michigan production of copper was 231,096,158 lb. in 1918; 268,508,091 lb. in 1917; 269,794,531 lb. in 1916; 238,956,410 lb. in 1915; 158,009,748 lb. in 1914; and 155,715,286 lb. in 1913. The low outputs in 1913 and 1914 are accounted for by the fact that there was a very small foreign demand for copper. Germany, before the War, was the greatest foreign market for Michigan copper. When this market was shut off by the blockade, it took the Allies some time to realize how large their demands would be for copper for munitions.

There is as yet no resumption of the demand from Germany for copper for manufacturing purposes, and there is a feeling that until such a demand does come there is not much hope for a change in the copper situation, particularly as it affects production from the Michigan district. Whatever sentiment there may be against the Germans, the fact remains that until Germany commences to buy copper there cannot be a demand sufficient to command a normal production from Michigan mines.

The New Arcadian and New Baltic, two prospects under the same management, decided to consolidate at a meeting of shareholders held in Houghton last week. This permits calling further assessments for development work. Seneca has purchased a mill-site from the Cliff company and plans for a stamp-mill, on Lake Superior, will be made immediately. Sinking has been resumed on the Seneca shaft, and driving is continuing. Lateral work on the first level made a total of 450 ft., of which 255 feet was north to the boundary line. The second level was started October 1. Osceola Consolidated produced 54,000 tons of copper ore in September, compared with 56,700 tons in August. Most of this came from the Kearsarge branch. Ahmeek produced 61,720 tons in September, an increase of 5000 over August. Allouez increased 2000 tons in September to 15,210. Mass Con. now is shipping 500 tons daily and in September sent 14,000 tons to the mill, not including mass and barrel stuff that went direct to smelter. Baltic, Champion, and

Trimountain mines of the Copper Range group are maintaining their high standard, Champion rock running 40 lb., the richest in the Michigan district.

NEVADA

LABOR CONDITIONS IMPROVING AT TONOPAH AND DIVIDE.

TONOPAH.—Labor conditions at Tonopah and Divide are improving rapidly, and it is evident that the defeat of the I. W. W. element has been complete. Miners are returning to both districts in large numbers, particularly from Ely. The MacNamara mill at Tonopah, which treats Tonopah Divide and Divide Extension ore, has

Lead, is 160 ft. deep. A cross-cut to the vein will be started at 200 feet.

GOLDFIELD.—In a 450-ft. drift on the 500-ft. level of the Red Hill ore 18 in. wide has been exposed continuously for a distance of 70 ft. The highest assay obtained is \$40 and the average grade is much lower. This ore is far south of the fault striking east through the Florence, beyond which a body of shipping ore has never been found. After the lateral extent of the shoot has been determined raising will be started. The effect of this fault on the main Florence vein and on the Jumbo vein of the Development company is to be determined

Photo by Tune, Goldfield

THE GLORY-HOLE AT THE COMBINATION SHAFT, GOLDFIELD, NEVADA

re-opened, and full crews are employed in the other mills, preparing them to be re-opened. It is reliably reported that, while the subject has not been discussed at the meetings of the operators, they are prepared to grant concessions to the workers as soon as the newly organized miners' local union gains a full membership. The men returned to work without receiving any concessions and it is known that the operators will willingly grant either a 50-cent raise or a co-operative store, whichever the men desire. Many miners are unemployed in the districts and will remain so because of their activities at meetings of the radicals during the strike.

SIMON DISTRICT.—P. A. Simon, president of the Simon Silver Lead, has bought control of the Norman, $1\frac{1}{2}$ miles south of the Simon and adjoining the Fagan. Sinking the shaft from 200 to 300 ft., or to the sulphide zone, will be started immediately with two shifts. The shaft of the Simon Mina, 1 mile north of the Simon Silver

through drifts from the south-east cross-cut recently started on the 350-ft. level of the Florence. A drift driven south in a 1-ft. seam of ore on the shale-latite contact in the Grandma has been discontinued owing to the oramation becoming badly broken, and a drift has been started north in the same shoot. Assays of from \$30 to \$38 are being obtained. A cross-cut is being driven south from near the face of the east drift on the 375-ft. level of the Great Bend in an attempt to open the extension of ore found on the 236-ft. level. The drift has been driven beyond where this ore should have been found and the cross-cut will be used in prospecting in the vein, which is from 60 to 70 ft. wide. A cross-cut driven 18 ft. north at the face of the drift encountered a heavy flow of water, leading to the belief that it is draining the Lockhart shaft, less than 500 ft. to the east.

GOLD MOUNTAIN.—The Washington Gold Quartz Min-

ing Co. plans to employ two shifts of miners as soon as houses for more men are erected. A contact of lime and porphyry is being explored on the surface and good assays for gold, silver, and lead are being secured. Numerous trenches and shafts of a maximum depth of 20 ft. have exposed the contact for a distance of 3000 ft. A tunnel is to be driven in the contact vein, which strikes east with several promising cross veins entering it from the north and south. The contact vein is rather flat and the cross veins stand nearly vertical.

WISCONSIN

DESCRIPTION OF THE ZINC FIELD.—OPERATIONS FOR SEPTEMBER.

The Upper Mississippi lead and zinc district is found in the extreme south-west corner of the State of Wisconsin, in three counties of Grant, Iowa, and LaFayette, and adjoining portions of Jo Daviess county, in Illinois. The district is about sixty miles in length, north and south, and about forty miles east and west. The leading mining camps have been, for more than forty years, Highland, Montfort, Linden, Dodgeville, Mineral Point, Livingston, Mifflin, Rewey, Platteville, Big Patch, Elmo, Cuba City, Meekers Grove, Benton, Shullsburg, Hazel Green, and Galena. Sporadic deposits have been found at points variously distant from the established mineral areas and considerable stretches of country between the camps are believed to be barren, so that the grouping of active ore producers at the present time is patchy and irregular. The Wisconsin district is one of the oldest in America. As early as 1780 French traders, under Julian Dubuque, bought considerable lead ore from the Indians. In 1823, lead mining under pioneer white settlers began at Shullsburg and Galena; and by 1846 over 2000 lead leases had been granted to miners by the general government. The first zinc ores were mined in 1862 at Centerville near and around Highland. These were the carbonate, known, in miners' terms, as 'dry-bone'. These mines still exist and are at this time being mined extensively by the New Jersey Zinc Co., which owns thousands of acres of fine farm land on the trend of the ranges established many years ago. The ore has been used largely in the manufacture of oxide of zinc, large quantities of which are utilized in the manufacture of paint.

Blende or sphalerite was of little value until about 1903, when modern methods were more generally introduced into the field. Before that time it was generally discarded. The sharp rise in the production of 1916 and 1917, due to the War, brought out the fact that the field had greater resources than it had been supposed. The output of the mines exceeded 250,000 tons of zinc ore, a large quantity of lead ore, and thousands of tons of pyrite, the last named being used in the manufacture of sulphuric acid. The field is also a fine farming district. Railroad facilities are good. The Chicago & Northwestern railway enters the field at Dodgeville, the county seat of Iowa county and ends at Lancaster, the county seat of Grant county. At Montfort a junction is formed with the Galena division and the route covers the very

heart of the entire mining field. Many producers of zinc ore and lead ore are situated practically upon the right-of-way. The Chicago, Milwaukee & St. Paul ends at Mineral Point and a branch extends west to Platteville. The Illinois Central and the Chicago, Burlington & Quincy are other roads serving the district. Mining is done on a leasing system, 10% royalty being allowed on the gross return from ore sales, except where the larger operating groups purchase a mine outright, which is not infrequent. The leasing system has resulted in close associations between land owners, the farmers, and the mining operators. This is a splendid asset for the miners as it aids materially in prospecting and development work and has restricted the activities of labor agitators, from which the district has been exceptionally free.

The four largest operating corporations are the Mineral Point Zinc Co. the western branch of the New Jersey Zinc Co.; the Wisconsin Zinc Co., a subsidiary of the American Zinc & Lead Smelting Co.; Vinegar Hills Zinc Co.; and the Frontier Mining Co. The success of the field in the main is founded on the working of large bodies of low-grade ore at low cost. The average zinc content of the milled concentrate for the entire field is about 25%. During the past year conditions in the industrial world responsible for irregular and at times uncertain markets have compelled operators to mine richer ground and at the same time improve the grade of concentrate, bringing the grade of concentrate to about 30%. The ores consist of blende, smithsonite, and galena, all more or less associated with marcasite and pyrite. These ores are found in openings, pitches, and flats, and disseminated deposits, classified as top and bottom runs. The early miners who sought lead ore exclusively sank shallow test-pits, seeking the crevices by narrow connecting drifts. The field in spots is pitted with these old shafts and the hummocks or burrow piles marking their location. These shafts never went below water-level because the pioneer miner was not especially well equipped with pumps, and indeed many clung to the theory that the water-level cut out any further extension of the ore. Zinc in that period was valueless because no market was offered for it, which explains why at this time prospectors seek the old lead ranges for deposits of zinc ore. Churn-drills were introduced into the field about 1900. These were light in construction and poorly equipped for deep borings or hard ground. Now well equipped and efficient drillers are numerous.

Location of shafts is largely determined by the prospect drilling. The depth ranges from 60 ft. to 200 ft., at bottom of which a sump of from 10 to 15 ft. is left below the working level. From the collar down to the solid rock the shaft is cribbed with timber or concreted. Producing-shafts contain two compartments, one for ladder and pump columns, the other for hoisting. Average size 'cans' are used, capable of holding 1200 lb. of ore. Cages are employed at some of the larger mines and record recovery shows as high as 500 'cans' of dirt raised in a single 9-hour shift. Ground is broken by underhand stoping. Air-hammer drills are used in the headings. The broken ore is shoveled into cars, at prices ranging

from 9 to 11c. per 'can' of dirt, according to the number of 'cans' filled. At one of the leading producers 9c. is paid up to 40 'cans'; over 40 and up to 50, 10c.; over 50, 11c., and in addition a bonus of 1c. per 'can' is paid to employees on six successive shifts. Mules are largely employed for underground tramping. At one or two places underground electric locomotives are used. On short hauls hand tramping still finds favor with the management.

Most of the mills in operation are about identical in appearance and design. They range in capacity from 50 to 250 tons per nine-hour shift. The same mill may show different records according to the quality of the ore. Three recoveries are made: galena, blende, and tailing. Some deposits are free of galena, but others carry a good deal, as well as small amounts of marcasite. The marcasite tends to go with the wet concentrate on account of

were as good as could be expected. Premium grade blende, the output of electro-static separating plants, held firm on a base of \$46 per ton, for both first and second-grade stock. At nearly all the electro-static plants, concentrate assaying more than 60% was obtained, and one mill produced concentrate averaging 63%. In such grade the premium no doubt brought the price to a high figure of \$50 per ton for the month. This price of \$46 per ton, base, held for the first fifteen days of the month, at the end of which a break came, the price receding to \$43.50 per ton, base, for first grade and \$42.50 for second-grade ore. This price held for the remainder of the month. Producers and sellers of low-grade were receiving 60c. per unit, which left a margin of profit sufficient to keep the small independent mines operating.

Lead-ore producers were in a better position, as a

A VIEW OF THE MELOY MINE OF THE VINEGAR HILL ZINC CO., SHULLSBURG, WISCONSIN

the similarity in specific gravities. Many attempts have been made to eliminate this before the ore reaches the mill, but little attention is given now to this because of the development of electro-static separation. Sliming is avoided as much as possible. Effort has been made to save waste through the use of sludge or slime tables, but these are no longer used. Electric power is supplied to mines and mills by the Inter-State Light & Power Co. of Galena, which now covers the entire field.

The Wisconsin zinc field invites further exploration, especially in the territory intervening between the ranges. Intelligent prospecting and exploration work with drill now enables the operator to block out the ore in advance of operations. The field is near the coal mines and smelters of Illinois, which offer a satisfactory market.

During September many obstacles prevented increased production by the zinc and lead mine operators, and materially reduced the profits. Strikes in different parts of the country were mainly responsible for the difficulties. A scarcity of cars, which was acute at one time, delayed production appreciably, and labor conditions were difficult, machine-men especially being in sharp demand.

Prices paid for zinc ore at the beginning of the month

marked advance in prices was made during the month. Opening at \$67.50, with demand good, the price jumped in the middle of the month to \$70 per ton, base, 80% metal content. This figure, however, did not hold long. The last half of the month saw the base creep upward steadily until \$72.50 was reached locally, and some sales of exceptionally clean product were marketed at a point in advance of \$75. This figure held at the close and still no disposition was shown to unload surplus stocks, held in reserve for many months. The same optimism that has prevailed for months pervades mining interests; some of the operators are foretelling \$85 per ton before the end of the next thirty days. Several new mines are doing much to increase the production of galena, and the unsold reserve in the field at the close of the month was variously estimated at from 1200 to 1500 tons. As the bulk of this is obtained as by-product in the process of wet concentration, it appears that operators will pursue their waiting game a while longer. Carbonate of zinc held steadily all month at \$26 to \$30 per ton, 40% base. Sales were light and independents did not share in the marketing.

Deliveries of ore, from mines to reduction plants in the

field, and from mines to smelter direct, were made for September as follows:

| District | Zinc, lb. | Lead, lb. | Pyrite, lb. |
|--------------------|-------------------|------------------|------------------|
| Benton | 12,982,000 | 80,000 | 1,676,000 |
| Galena | 4,056,000 | 546,000 | |
| Livingston | 3,600,000 | 160,000 | |
| Cuba City | 1,654,000 | 344,000 | 1,984,000 |
| Shullsburg | 992,000 | 88,000 | |
| Highland | 960,000 | | |
| Hazel Green | 412,000 | | |
| Total | 24,656,000 | 1,218,000 | 3,660,000 |

Refiners did not make the return ordinarily reported from month to month, one of the leading establishments being out for a time re-lining hearths. Shipments were made as follows:

| | Lb. |
|---------------------------------------|-------------------|
| Mineral Point Zinc Co. | 5,242,000 |
| Wisconsin Zinc Co. | 3,628,000 |
| National Zinc Ore Separating Co. | 3,000,000 |
| Linden Concentrating Co. | 870,000 |
| Total | 12,740,000 |

Of the raw ore output disposed of to reduction plants, the Mineral Point Zinc Co. received 5209 tons; Wisconsin Zinc Co. 3551 tons; National Zinc Ore Separating Co. 2340 tons; Linden Zinc Co. 1228 tons. Of the high-grade separator product, the Mineral Point Zinc Co. received 2521 tons, and 479 tons of carbonate zinc was shipped to smelters direct. The American Zinc Co. received 1486 tons of premium blende; Grasselli Chemical Co. 1005 tons; United Zinc Smelters, 780 tons; American Metal Co. 506 tons; Illinois Zinc Co. 187 tons. The gross recovery of wet concentrate for September was 12,282 tons; net deliveries 7064 tons.

BRITISH COLUMBIA

LABOR TROUBLES.—CONCENTRATORS FOR ROSSLAND AND KIMBERLEY.—PREPARATIONS FOR WINTER IN THE SALMON RIVER DISTRICT.

Labor troubles have closed down operations on three of the most important of British Columbia's metal mines. Two of these are situated in East Kootenay, namely, the Sullivan mine, owned by the Consolidated Mining & Smelting Co. of Canada, and the North Star mine, Kimberley, which has been shipping regularly to the Trail smelter. The third is the Nickle Plate mine, owned and operated by the Hedley Gold Mining Co. The Hedley mine was the greatest producer of gold in British Columbia for years, until the Surf Inlet mine began operating on a considerable scale two years ago. The production has averaged around \$700,000 a year. The ore is arsenopyrite and the Tacoma smelter, which has been treating the concentrates, has been paying for the arsenic content during the past two years. Ore valued at between \$4,000,000 and \$5,000,000 is in reserve. With the fall in the purchasing power of gold and the increased cost of production of late the company's profits have been seriously affected. On top of this came a demand for an increase of wages from the miners and fifty cents a day was granted. A like amount again has been demanded

and the directors have decided that, as this would mean operating at a loss, they would be better off to close the mine and mill. As a result a force of about 100 miners will be thrown out of employment, a small force only being retained on development.

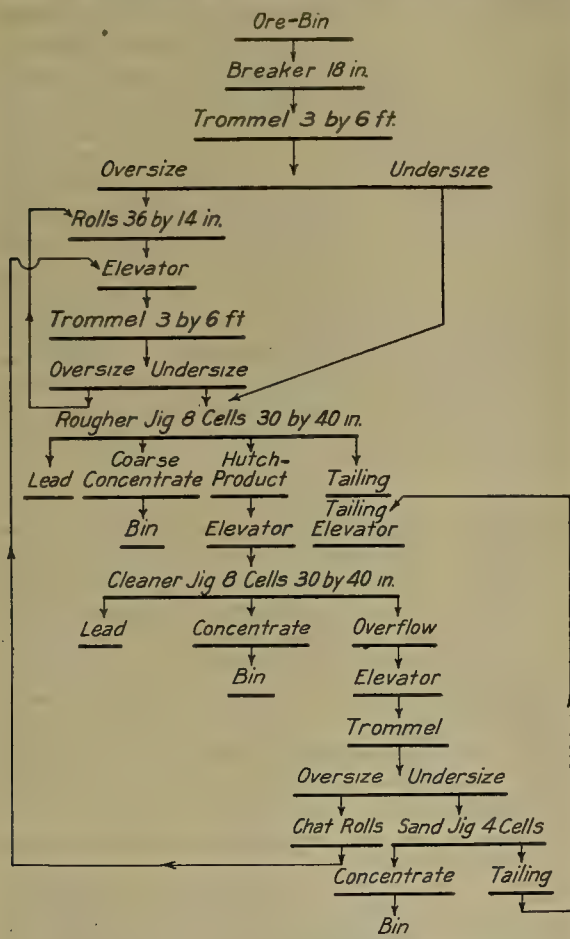

The Sullivan mine is the chief source of zinc ore for the Trail smelter, the production of which is between 18,000 and 20,000 tons of zinc per annum. It is observed that the strike of the miners and the consequent practical closing down of the mine is likely to interfere with the company's taking advantage of its agreement with the Dominion government, which is a part of the war supply contract and under the terms of which the smelter received a minimum price of 8c. per lb. for its zinc.

At a recent mass meeting of the miners of Kimberley matters relating to the strike were discussed. Negotiations looking to an adjustment have been conducted through a representative of the Department of Labor, Ottawa, a proposal being made to the men that, if the One Big Union was repudiated, the companies would be prepared to meet a committee of the employees. The appointment of a Board of Conciliation under the Industrial Disputes Act was the method suggested as being most likely to effect a settlement. However, while the Miners' Committee claimed it did not represent the 'One Big Union', the miners in attendance declined to give an understanding that they would repudiate it. Consequently negotiations ceased. The Government representative has returned to Calgary and the companies are said to be preparing for a long strike.

TRAIL.—The Consolidated Mining & Smelting Co. is considering plans for the erection of two concentrating plants, one at Rossland and the other at Kimberley. The Kimberley plant is said to be planned for a capacity of 10,000 tons daily at the outset, with the possibility of the erection of another unit of the same size, which would make the total capacity 20,000 tons. If the project thus outlined is carried through the concentrator would be the largest on the continent. Plans for the Rossland plant have been under consideration for some months. It was proposed at first to provide a 1500-ton plant, but recent reports are that the company now has in mind one with a capacity of 5000 tons. The chief problem at Rossland has been a source of water. The city has the first right to the supply, but has shown a disposition to share it liberally with the smelting company. The construction of a dam in the mountains near Rossland, it is believed, would take care of this need, although there is no doubt that the expense of the undertaking would be considerable. The proposed site of the Rossland concentrator is between the War Eagle and the Le Roi mines, and the sources of ore would be the Le Roi, War Eagle, and Centre Star mines, which are the property of the Consolidated Mining & Smelting Co. In these are large reserves of low-grade copper-gold ore. At Kimberley the chief ore supply will come from the Sullivan mines of the Consolidated company. From these properties from 2000 to 4000 tons of lead and zinc ores are shipped weekly. In addition to this ore, which is of smelting grade, the mine contains a large quantity of ore carrying

zinc and lead in smaller quantities. Its removal at a profit was a problem until a year ago, when it was announced that it had been solved by the metallurgical staff of the company at the Trail smelter.

SALMON RIVER.—In the Salmon River district, Portland Canal, preparations already are being made for winter by the various mining companies. The snow comes early and stays late in the hills of this region.

FLOW-SHEET OF A TYPICAL MILL IN THE WISCONSIN
ZINC DISTRICT

While it is impossible as yet to say just how many men will be employed at the various mines throughout the winter, it is certain that there will be a substantial payroll and that the centres of Stewart and Hyder will continue to be quite bustling and active throughout the closed season. Among the companies that will continue to operate are the Premier, Bush, Big Missouri, Forty Nine, Mineral Hill, and the New Alaska, the last being on the Alaskan side of the boundary line. These all are in the Salmon River district. On Bear creek it is expected that the Lakeview, recently bonded by P. Welch and associates, and possibly the George copper properties will maintain operations. Although all these properties are reported to be in such shape that work can be continued through a hard winter, the mainstay will be the

Premier, on which a considerable force will be employed. During the summer the efforts of the Premier company have been devoted to a large extent to road-building. On the Big Missouri, diamond-drill operations thus far are said to have been highly satisfactory. A similar report comes from the Forty Nine property on which drilling is in progress. It is said, in regard to the latter, that the short tunnel which was driven to intersect the vein encountered high-grade ore, on which drifts are now being driven. Those interested in Salmon River properties are, in general, satisfied with the season's work. The development on many properties has been almost all that was hoped for, and mine operators and prospectors are looking forward to next summer.

ONTARIO

OPERATIONS INCREASING IN THE NICKEL DISTRICT.—
WASAPIKA OBTAINING FAVORABLE RESULTS.

SUDBURY.—The nickel industry is recovering from the depression resulting from the close of the War and is looking for new markets. The International Nickel Co. is devising plans to encourage the use of nickel in new ways, and more especially to extend its employment as an alloy in connection with the manufacture of automobiles and other vehicles for which a hard metal is required. The company is steadily increasing the scope of operations after the curtailment of its output following the Armistice. It has now about 1300 men at work. Mining has been resumed at Creighton mine and the output of Bessemer matte has been increased to about 3000 tons per month. Crean Hill mine, which was producing during the War, remains closed. The bridge for handling the ore at O'Donnell roast-yard has been completed. At Coniston, seven miles east of Sudbury, where the plant of the Mond Nickel Co. is situated, work is also increasing. After the Armistice the company curtailed its operations by about one-half. It is now employing 700 men, and after considerable delay, shipments of nickel matte to the refinery at Swansea, Wales, have been resumed. The company has for some time had in contemplation an extension to double the capacity of its plant, involving a total expenditure of \$3,000,000. The present smelting plant is four furnaces and three converters, to which it is proposed to add three new furnaces and three converters, bringing it up nearly to the size of the International company's plant. Work on this was held up by the unfavorable conditions. The British-American Nickel Corporation is still engaged in construction work, but expects to begin operations early in the winter. It is building a plant at Nickelton, three miles north-west of Sudbury, which will have three furnaces and three converters and will employ 1800 men at the outset. A force of 800 is now engaged in the work of construction. The supply of ore will be drawn from the Murray mine in the immediate vicinity of the smelter, where 8,000,000 tons of ore has been proved. The refining will be done at Deschenes, Quebec, on the Ottawa river, where a plant is under construction. The electrolytic process will be used.

KIRKLAND LAKE.—The strike of miners is still unsettled, but the men that remain in the camp appear anxious to resume work. Several of the leading mines have re-opened or are making preparations to do so. The Lake Shore was the first to resume operations. The Teck-Hughes is re-organizing its working force and has secured a number of men. The Kirkland Lake and Wright-Hargreaves will be operating very shortly. The general shortage of labor may for a time considerably restrict operations, but relief is expected shortly, as it is officially stated from Ottawa that unemployment is increasing and an influx of labor into the mining districts is anticipated.

COBALT.—The mines are generally in full operation with plenty of labor obtainable. One result of the strike is that unrest and agitation have disappeared, with a marked improvement in the efficiency of the working forces. The ore-reserves of nearly all the producing mines have recently shown a considerable increase, which with the increased value of silver places the industry on a favorable and satisfactory basis.

WEST SHINING TREE.—At the Wasapika a cross-cut at the 100-ft. level has gone through 50 ft. of vein matter without reaching the limit of width. The ore is reported to be excellent, showing visible gold.

QUEBEC

LAKE DU PARQUET.—A new mining field may be developed at Lake Du Parquet, close to the Ontario boundary at a point near Lake Abitibi. Geological conditions are stated to resemble in some respects those of the Porcupine field. Quartz veins occur which are reported to show some mineralization, and a small amount of visible gold has been found, although assays have not so far indicated ore. A number of claims were taken up a year or so ago, but the interest in the field soon subsided. It is now announced that the Timmins interests of the Hollinger have secured an option on the Bishop claims, one of the most promising prospects, and have also had a representative staking other claims which will be subjected to a thorough exploration. This is directing the attention of many mining men to the area.

SONORA

CHANGES IN THE POWER-PLANT OF THE MOCTEZUMA COPPER CO.—PRODUCTION FIGURES.

NACAZARI.—The Moctezuma Copper Company is changing its steam-turbine power-plant to Diesel engines, and is increasing the horse-power of its plant. Eight Diesel engines are being erected, four of 1000 hp., two of 1500 hp., and two Diesel-driven air-compressors of 750 hp. each. The latter equipment will result in increasing the company's drill capacity for underground development. The Moctezuma company's mill soon will be overhauled and almost completely re-modeled. A series of experiments conducted at the Copper Queen smelter in Douglas has resulted in development of variations in the flotation process suited to the Moctezuma ores, and will serve to guide the design of the mill. The present mill capacity of 2400 tons will be increased to 3000 tons.

EL TIGRE.—The property of the Lucky Tiger Combination Mining Company is maintaining its average ore production. During September the mine production was 6367 tons, all of which went to the concentrator. Twelve carloads of concentrates were shipped to El Paso for smelting. During the latter part of the month the company made connection between the main working shaft and the main haulage level. Installation of an electric haulage-system in the mine also was completed during the month. The main shaft now has been sunk below the eighth level or about 1300 ft. below the point where the main vein is exposed upon the surface.

AGUA PRIETA.—Imports made into the United States through this port during the month of September amounted to 229 carloads of ore, 10,041 tons, valued at \$1,856,900 gold. This marked a small increase over the previous month, but in August heavy rains, which washed out the line of the Nacozari railroad, delayed ore shipments to a considerable extent. Of this total properties surrounding Nacozari shipped 209 cars, or 9360 tons. El Tigre shipped 12 cars of 450 tons. The following shipped one car each, of the tonnage designated: Rosales 41, San Pablo 39, La Nueva Amistad 16, Las Chispas 29, Madame Esther 3, San Jose 35, San Nicolas 39, San Ygnacio 29.

CANANEA.—This district came nearer to attaining normal production in September than any in the Arizona-Sonora belt. The total output of the smelter of the Cananea Consolidated Copper Company for September was 4,500,000 lb., which was within one million pounds of the record figure in the company's production. It indicates plainly the return of the company to normal. There was some trouble in the latter part of the month at the company's Puertocitos mine, as a result of a dispute between the American foreman and native laborers which brought on a strike. This was adjusted satisfactorily, however.

PILARES DE TERRAS.—John Hohstadt, pioneer miner and cattleman of northern Sonora, is making preparations for opening a prospect he owns, adjoining the Roy and Cinco de Mayo properties. He will run a development tunnel approximately 1500 ft. in order to strike the orebody exposed on the surface. The work will be contracted.

CHIHUAHUA

Mining in Chihuahua and central Mexico is showing an improvement as a result of lessened activities on the part of revolutionists and bandits. The American Smelting & Refining Co. is constructing a machine-shop at its smelter at Avas, near the city of Chihuahua, and will be receiving ore from the Santa Eulalia and Parral districts in a short time. Several mines owned by American companies in this district have been placed in operation again, and a number of American mining men who left their properties when Villa was active in the vicinity have returned to their duties. Among the more important mines upon which operations have just been resumed is the Tecolotes at Santa Barbara.

ALASKA

Fairbanks.—Constitutionality of the Alaskan Legislative Act of 1915, requiring the filing of affidavits showing that the annual assessment work has been done on mining claims, was sustained on October 13 by the Supreme Court, which declined to interfere with the conviction of G. A. Vedin, at Fairbanks, under this statute. Vedin was sentenced to three years' imprisonment.

ARIZONA

Globe.—The Old Dominion Copper Co.'s production is now two-thirds of normal, the production for August having been 1,937,000 lb. The Kingdon shaft is now being sunk from the 1950-ft. level to the 2150-ft. level.—Work on the concentrator of the Iron Cap Copper Co. has been started. The first unit of the plant is to be approximately 500 tons capacity. Other units are to be added as required. David Cole is consulting engineer for this work.

Johnson.—The Keystone Copper Co. is working six men driving on the 600-ft. level to cut ore opened on the 400-ft. level.—The Republic mine has resumed operations. Seventy men are now at work and production is in the neighborhood of 2000 tons per month. This output is to be doubled in the near future. Plans are being made to sink an 800-ft. shaft to replace the present inclined shaft.

Kingman.—The Tipperary Mining Co. has purchased the McKesson group of mines about six miles north of Wallapai station. The company's machinery at Oatman is to be shipped to the new property. Shallow cuts and drifts together with a 40-ft. shaft is all the development work that has been done on the property.—The Pawva Company, six miles east of Kingman in the north end of the Wallapais, has opened good ore in the drift on the 180-ft. level. The company has purchased the Last Chance mill, which is now being overhauled. G. W. Gibson is manager.

Miami.—The Miami Copper Co. has declared a dividend of 50c. per share for the quarter ending September 30, payable November 15 to stockholders of record at the close of business on November 1.

Oatman.—The United Eastern Mining Co. has declared a dividend of 7c. per share, payable on October 28 to stockholders of record at the close of business on October 8.

Patagonia.—It is reported that the Sunnyside mines, which are situated near the World's Fair, the Three R, and the Trench mines, have been bonded to the Cananea Copper Co. for \$200,000.

Prescott.—Development at the King mine near Hillside is progressing favorably. The shaft has reached the 400-ft. level, at which point driving is to be started. Ten tons of ore per day is now being produced.—A carload of carbonate ore from the Dundee Arizona Copper Co. is to be tested in the new leaching unit at the Humboldt smelter.

CALIFORNIA

Adin.—Hess Gold Mining Co. has decided to sink a new working shaft 500 ft. The old shaft is 350 ft. deep and was sunk at the point of discovery. The Hess for several years has been a consistent gold producer.

Forest.—Driving to the west is proceeding from the main level of the North Fork to seek a vein in the foot-wall. Near surface this vein is said to have shown excellent ore. George F. Stone is superintendent.

Genesee.—A carload of copper-silver-gold ore, sampling \$150 per ton, has been shipped from the Piolet mine to the International smelter. Development of the vein is exposing considerable shipping ore, and the owners plan to send out another carload shortly. The Piolet adjoins the Genesee and Five Bears group and is owned by Albert and Joseph Goodhue.

Grass Valley.—The Central Consolidated Mining Co. has been organized in San Francisco to take over the Central, Banner, and North Banner mines. Plans for a mill of 5000 tons per month are being drawn.

Hayden Hill.—Development of the old Juniper is in progress, and it is understood a small mill will be purchased. The ore is gold-bearing and of good grade. The mine is being rehabilitated by Frank Harbet and Peter Keogh.

Meadow Valley.—Greenbower Mining Co. is building a new wagon road and has arranged for the construction of a restraining dam, ditch, and pipe-line. The dam is to be 280 ft. long, 35 ft. high, and 85 ft. wide at base. It will be composed of reinforced concrete. Estimates place the gravel available for hydraulicking at 500,000 cu. yd. The mine is situated near Mount Ararat. H. J. Greenbower is manager.

Placerville.—James H. Zimmerman, who recently sold the Pacific Deep Gravel mine, seventeen miles east of Placerville, to J. E. Sexton, states that over a dozen men are busily employed erecting an air-compressor, air-drills, blacksmith and repair shop, and miners' change-room. This is preparatory to running a new cross-cut tunnel 1300 ft. long, 30 ft. vertically below the old 900-ft. cross-cut tunnel, in order to get in under the body of cemented gold gravel.

Redding.—Arbuckle Mining Co., operating the Bell Cow mine on Arbuckle mountain, has increased the working force and reports 50,000 tons of ore developed. Much of this is said to sample \$10 to \$15 per ton, with the richer shoots assaying \$30 to \$100 per ton. Frank Green, of Ono, is one of the leading owners.

COLORADO

Silverton.—The Sunnyside Mining and Milling Co. construction work is progressing rapidly; one bunk-house is completed and occupied, and painting and interior decorating is now under way. The compressor-house is completed, and the second bunk-house, commissary, and other buildings will be finished before the heavy snows come. Milling has been under way for several weeks, the old tailing-dump being worked over, with a recovery of zinc concentrate. The material is moved to the mill by an air-lift, then pumped in three stages to the tube-mills. Four thousand tons of ore is in the bins, and a mill-run is now being made on this ore. This will keep the mill running until October 15, when another shut-down is anticipated. Giachetti & Co. have assigned their lease on the Blacksmith level of the Champion to M. J. Arietta & Company.

IDAHO

Mullan.—Reports reaching Wallace are that the Gold Hunter mine will soon resume operations, when a night-shift is to report for work following the proposal of the miners to go back to work under the same conditions as those prevailing at the time of the strike last July.

Wallace.—The Consolidated Interstate-Callahan Mining Co. reports that the ore taken from the scene of the discovery made recently on the 500-ft. level is running 30% zinc, with corresponding amounts of lead and silver.

NEVADA

Carson City.—Mason Valley Mines & Smelter Co. has requested assistance of Nevada Public Service Commission in securing favorable freight-rates for custom ore shipments to the Thompson smelter. J. F. Shaughnessy, chairman of the Commission, has been delegated to take up the proposition with officials of the Western Pacific and Southern Pacific companies. It is stated the company plans to enlarge and improve the smelter at a cost ranging from \$600,000 to \$1,000,000. Special attention will be paid to custom ore from Nevada mines and properties located in Plumas, Lassen, and Modoc counties, California.

Goldfield.—The Florence-Goldfield Co. has arranged for the treatment of its ore at the enlarged mill of the Goldfield Development Co., and taken under lease territory from the C. O. D. and Red Hill-Florence companies adjacent to ground being explored from fifth level of the Florence. F. Somer Schmidt states it is the policy of the company to encourage lessees and that much ground now being explored may be given over to lessees following ore disclosures. The west cross-cut into ground leased from the Goldfield Development Co. has progressed 220 ft. and is showing veins of low-grade quartz. Reorganized Black Butte Co. has arranged to drive a south-east cross-cut from the 190-ft. level of the Dortch shaft to intersect a vein cropping prominently at surface.

Tonopah.—Tonopah Divide and Tonopah Hasbrouck companies have resumed ore shipments to the MacNamara mill. The Divide Extension will start shipments in a few days. It is reported that the Tonopah Divide shaft at a depth of 54 ft. is in ore sampling \$57 across 6 ft. The shaft has been in ore from the surface, but not of such good grade.

Yerington.—The Bluestone Mining & Milling Co. is doubling the size of its flotation plant, which will make the capacity one thousand tons per day. The old unit has again been started up. It is uncertain when the new addition will be ready.—The Mason Valley Mines Co. has petitioned the railroad commission in Carson City for adjustment of the rates on ore to the Thompson smelter. The mining company states that it wishes to make a custom smelter out of its plant and to add reverberatory furnaces so that concentrates can be treated. It is believed that if the rates are lowered, the alteration of the plant will start at an early date and the mines of the district will soon resume operations immediately. The tonnage of oxidized ore in the district is rapidly becoming smaller and future operation of the smelter will depend on its ability to handle sulphide ores and concentrates.—The development of the Northern Light mine, 14 miles east of Yerington, has been encouraging. It is under option to the Mason Valley Mines Co. which has proved the existence of a body of sulphide ore at the shale contact.

WASHINGTON

The Kaaba Mines Co. has started the erection of a new plant at the mine to replace the temporary development plant now in use. The new plant includes a 600-ft. compressor, a 4000-ft. hoist, with a steel-sharpener, assay office, and complete electrical equipment.

Personal

The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

Edwin Ludlow has opened an office as consulting engineer at 149 Broadway, New York.

Clarence Woods, of Los Angeles, sailed on October 5 from New Orleans on his way to Honduras.

Morton Webber has been to Globe, Arizona, and to Butte, Montana, and is now at Mackay, Idaho.

Alfred H. Brooks, chief of the Alaskan branch of the U. S. Geological Survey, has returned to Washington.

W. W. Wishon passed through San Francisco on his return from the Cariboo district, B. C., to Los Angeles.

J. S. Williams, Jr., general manager for the Moctezuma Copper Co., has returned to Douglas from New York.

A. T. Thomson, assistant to the president of the Phelps Dodge Corporation, has returned to Douglas from New York.

H. Barzin, assistant superintendent of the Katanga Copper Co. in the Belgian Congo, is visiting metal mines in the West.

G. C. Martin, of the U. S. Geological Survey, passed through San Francisco on his return from the Upper Yukon to Washington.

R. W. Macfarlane, acting superintendent for the Arizona Copper Co. at Morenci, was in San Francisco last week on a short holiday.

H. Harrison Smith, son of W. Hinckle Smith, a director of the Utah Copper Co., was a recent visitor to the company's properties.

John McGregor, secretary-treasurer of the Flux Mining Co. at Patagonia, Arizona, is laid up with a broken leg, sustained while deer-stalking.

K. S. Twitchell, an American mining engineer in the employ of British interests on the island of Cyprus, was a recent visitor to Salt Lake City.

L. R. Budrow, general manager for the Lucky Tiger Gold & Silver Mining Co., at El Tigre, Sonora, returned recently from a stay of several weeks in California.

F. R. Reets, director of purchases for the A. S. & R. Co., was a visitor to that company's smelters in Utah, as well as to the Utah Copper properties, during October.

George L. Sheldon has made an examination of the Wyoming-Nevada Copper Co.'s property, near Imlay, Nevada, and is now on his way to Dillon, Montana.

D. D. Moffat and **E. W. Engelmann** of the technical staff of the Jackling management, were recent visitors to the mill of the Nevada Consolidated Copper Co. at McGill. They have returned to Salt Lake City.

L. S. Cates, general manager for the Ray Consolidated Copper Co., and assistant general manager for the Utah Copper Co., has returned to his headquarters at Salt Lake City after a business trip to British Columbia. **D. D. Moffat**, consulting engineer of mills for the Jackling porphyry properties, accompanied Mr. Cates.

R. C. Gemmell, assistant managing director of the Utah, Chino, Nevada Consolidated, and Ray Consolidated copper companies, left Salt Lake City on October 10 for Ray, Arizona, where he will meet **D. C. Jackling**, vice-president and managing director of the companies named. After inspecting the Ray properties they will go to the Chino properties in New Mexico. Mr. Jackling will then go to New York City for a several weeks' stay, while Mr. Gemmell will return to Salt Lake City.

R. N. Dickman, of the firm of Dickman & Mackenzie, at Chicago, died at La Jolla, California, on September 14.

THE METAL MARKET

METAL PRICES

San Francisco, October 14

| | |
|--|-------------|
| Aluminum-dust, cents per pound..... | 60 |
| Antimony, cents per pound..... | 9.00 |
| Copper, electrolytic, cents per pound..... | 23.00—23.50 |

| Platinum, 10% indium, per ounce..... | \$150 |
| Quicksilver, per flask of 75 lb..... | \$85 |
| Spelter, cents per pound..... | 8.25 |
| Zinc-dust, cents per pound..... | 11.00—13.50 |

EASTERN METAL MARKET

(By wire from New York)

Oct. 14.—Copper is more active and stronger. Lead is quiet and firm. Zinc is inactive but steady.

SILVER

Below are given official or ticker quotations, in cents per ounce of silver 999 fine. From April 23, 1918, the United States government paid \$1 per ounce for all silver purchased by it, fixing a maximum of \$1.01½ on August 15, 1918, and will continue to pay \$1 until the quantity specified under the Act is purchased, probably extending over several years. On May 5, 1919, all restrictions on the metal were removed, resulting in fluctuations. During the restricted period, the British government fixed the maximum price five times, the last being on March 25, 1919, on account of the low rate of sterling exchange, but removed all restrictions on May 10. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (825 fine), calculated at the normal rate of exchange.

| June | 85.50 | 112.00 | 84.40 | Dec. | 117.42 | 115.00 | |

MONEY AND EXCHANGE

Foreign exchange remains sensitive and irregular, without much evidence to account for its fluctuations.

Publication by the Treasury of a revised list of credits advanced by the Allies shows the large accommodations which have been granted since ending of hostilities. From the Armistice to September 22 the Treasury has made advances of \$2,229,502,209. In the first seven months following the Armistice credits were extended in a large degree to allow the Allies to purchase foodstuffs and raw materials in this country to restore their depleted stocks and advances averaged \$280,117,180 a month. Advances since the Armistice, up to and including September 22, are shown in the following:

| | | | |
|----------------|---------------|-----------------|---------------|
| November | \$209,249,697 | May | \$194,911,857 |
| December | 389,052,000 | June | 54,750,000 |
| January | 290,250,800 | July | 97,650,000 |
| February | 145,397,802 | August | 54,275,945 |
| March | 322,350,000 | September | 62,008,000 |
| April | 409,608,608 | | |

Total

Of credits granted since the entrance of this country into the War, Treasury statements show re-payments have been made as follows: May, \$7,570,000; July, \$10,000; and August, \$26,577,000, a total of \$34,157,000. In addition there have been some re-payments in September, but definite figures have not been announced. Announcement by Secretary Giano that an agreement has been reached providing for funding of the \$500,000,000 yearly interest on loans to the Allies indicates that large re-payments at this time cannot be expected.

A Paris cable says \$90,500,000 increase in Bank of France circulating notes is due to payments to inhabitants of devastated regions. Since June 30, paper circulated by the Bank of France increased \$350,000,000, and since the Armistice \$1,100,000,000. In 1914, \$1,300,000,000 was outstanding with \$935,000,000 gold cover, or 71%. Now has \$7,000,000,000 out, with \$1,075,000,000 gold cover, or 15%. Bankers had previously regarded this increase as expansion, but they now believe the issues were against indemnity due the inhabitants of the devastated regions. Many French financiers favor the issue of a Government loan purchasable only in Bank of France notes, these notes to be retired, thus cutting down the standing paper. What bankers regarded as a praiseworthy effort of the German Reichsbank to cut down paper issue is now shown to be simply a retirement of marks in Alsace-Lorraine and Belgium by French money. Bankers state the gold advance of \$300,000,000 for the cover of currency of new nations would stabilize currency of all Eastern Europe.

An advance in federal reserve bank discount rates is likely before long. It is an entirely anomalous situation in the money market today, when banks are able to secure 10%, 12%, and 15% for call money at the same time that they obtain advances from federal reserve banks at 4% for 15 days, and re-discounts up to 90 days at 4½% on security of United States government war obligations. Discount rates will probably be raised about October 24, when loans that the banks made to customers to carry subscriptions on the Fourth Liberty Loan, which they agreed to do for a year at the bond rate, expire. When re-discount rates are raised the federal reserve institutions will begin functioning in a proper manner in the money market.

Eastern Metal Market

New York, October 8.

There is very little change in the general situation. Business is more or less at a standstill. With the steel and other strikes, buying is mostly hand to mouth and general quietness is expected to prevail until there is some definite and clear-cut outlook into the future.

The copper market has been quiet with a slight easing in prices by outside interests.

Although the tin market is not active it is firm and fairly strong.

The lead market, while inactive, has a strong undertone and prices are firm.

Prices of zinc have advanced sharply in the last two days and buying is better.

There is no change in antimony.

IRON AND STEEL

It is generally conceded that the back of the steel strike has been broken but that a return to normal conditions will be slow. It is likely to be largely a sellers' market from now on or at least for a time. Large producers are expected to hold down prices. Premiums rule for prompt shipment and no cancellations have been received even by mills that are shut up tight. Pig-iron output in September, according to the blast-furnace reports of 'The Iron Age', was 2,441,554 tons, or 301,834 tons less than August, which had 31 days. It was, however, larger than July's output of 2,428,541 tons. The daily average in September was 81,385 tons against 88,496 tons and 78,340 tons in August and July, respectively. The effect of the strike is shown by a net loss of 103 furnaces on the active list. Activity in foundry-iron is the outstanding factor. Inquiries for rails for next year are prominent. Pittsburgh sheet mills are operating about 70% of capacity. American prices on machine tools for a French car works totaled 1,800,000 francs, against a German offer of 450,000 francs. The French Government said the buyers were justified in going to Germany.

COPPER

What little demand exists is being satisfied largely by smaller producers and dealers in what is termed the outside market. Here electrolytic copper for early or October delivery is selling at 21.25c. to 21.50c., New York, with near future position about $\frac{1}{4}$ c. higher. Lake copper in this market is about 21.50c. to 22c., New York. Large producers continue to maintain their prices at 23.50c., New York, for both Lake and electrolytic. Little business is reported in the last week from any source, domestic or foreign. The steel strike is having its effect in this market but to a rather small degree. Domestic consumption on the whole is decreasing rather than otherwise. Estimates place the output of domestic smelters at about 100,000,000 lb. per month. Japan continues to take considerable copper. Oriental shipments, including China, have been 10,285 tons on the last 60 days. It is calculated that total exports for September will have been about 45,000,000 pounds.

TIN

The market is quiet. A fairly good business was done last week in future shipment from the East at around 53c., but very little spot tin has been reported sold, the quotation for which yesterday was 55.25c., New York. In the last ten days the entire market has been very dull with practically no sales of future shipments heard of. The advance of nearly 25 per ton in the London market has, however, had its effect here so that prices are nominally higher and firm. This has been caused over there by the better feeling due to

a termination of the British railroad strike, but it is believed the advance has been too rapid as a whole. An interesting fact is that the 'Homestead', which arrived last week, had aboard 2250 tons of Straits tin, all from the Far East, the largest consignment ever to arrive on one vessel. The 'Gaelic Prince', due this week, is said to have on board 1350 tons, making the total arrivals very large in so short a period. This has had a sentimental effect on the market. Total arrivals this month have been 1880 tons. Total arrivals in September were 4825 tons, of which 1725 tons came in at Pacific ports. Stocks and landing on September 30 were 1515 tons. Total imports for the year to October 1 have been only 16,976 tons, as against 44,837 tons in the same nine months of 1918. The quantity of tin afloat on October 6 was 7985 tons. Shipments from England recently have been almost nothing, due to the railroad strike over there. Despite the large tin arrivals here it is not believed that much of this is being re-sold by consumers to whom it is consigned. American electrolytic is reported as offered at lower prices than Straits or pure English tin, but just what these prices are it is difficult to learn. One quotation for the American tin is 54.87 $\frac{1}{2}$ c., New York, with 99% pure held at 54.25c. to 54.50c.

LEAD

There has been little change in the lead situation in the last week. It is claimed that the outside lots have been pretty well absorbed with the lowest price now at about 6.15c., New York. The American Smelting & Refining Co. still maintains its price at 6c., St. Louis, and 6.25c., New York. We quote the general market at 6.20c., New York, and 5.95c., St. Louis, for October delivery, the latter position being firm, and higher relatively than its Eastern market.

ZINC

This market is the only one that is distinctly higher. Prime Western for October or early delivery was quoted yesterday at 7.37 $\frac{1}{2}$ c., St. Louis, or 7.72 $\frac{1}{2}$ c., New York, an advance of $\frac{1}{4}$ c. over a week ago. The principal cause is the general recognition of the fact that the steel strike, in galvanizing centres at least, is a failure. Galvanizers have become more interested in the market and dealers and some operators have been buyers. These two factors have been the cause of the higher prices. As to exports, the situation is more favorable because of the settlement of the British railroad strike, releasing ships held up in American ports.

ANTIMONY

Demand is light and the market is dull and unchanged at 8.50c. to 8.75c., New York, duty paid, for wholesale lots for early delivery.

ALUMINUM

No. 1 virgin metal, 98 to 99% pure, is unchanged at 32c. to 33c., New York, for wholesale lots for early delivery.

ORES

Tungsten: Business is at a standstill, both because of the strike and because of the tariff controversy. Resolutions against the tariff bill as passed by the House were adopted recently at a meeting in New York.

Molybdenum: Some business is reported at 75c. per lb. of MoS₂ in regular concentrates, but the market is not lively.

Manganese-Iron Alloys: Some British producers are quoting \$100, seaboard, for 76 to 80% alloy, for delivery the remainder of this year, while others are still asking \$105 to \$110. The market is quiet. Spiegeleisen is quoted at \$35, furnace, but this could perhaps be shaded.

Book Reviews

Lecture Demonstrations in Physical Chemistry. By Henry S. Van Klooster. Pp. 189, ill., index. The Chemical Publishing Co., Easton, Pennsylvania. For sale by 'Mining and Scientific Press'. Price, \$2.

This book consists mainly of descriptions of various 'experiments' that can be used to illustrate classroom lectures on the various phenomena of physical chemistry. The subjects treated include osmosis, diffusion, vapor pressure, catalysis, the ionic theory and other branches of electrochemistry, solubility, adsorption, actino-chemistry, combustion, and explosion. The book will appeal to the professor teaching these subjects and possibly to the person with a dilettante interest in the same. Supplemented by a good textbook it might be used to advantage by the student.

Model Making. Edited by Raymond F. Yates. Pp. 379, ill., index. The Norman W. Henley Publishing Co., New York. For sale by 'Mining and Scientific Press'. Price, \$3.

Those who have associated model-making with toy-making will be enlightened to learn from a perusal of this book of the importance of the pursuit. About one-third of the book is devoted to the equipment and processes used in model-making, some of the subjects discussed being the workshop in general, lathes, drills, soldering, tempering and hardening steel, abrasives, pattern-making, and electroplating. The remainder of the book discusses the construction of various kinds of models, among them being several steam-engines, an aeroplane, a steam-turbine, a steam-boiler, several vessels, a crane, a gasoline engine, an electric-locomotive, and a steam-locomotive. The book is illustrated with over 200 photographs and line-drawings. It will be of value to those who are interested in model-making.

Liquid Fuels for Internal-Combustion Engines. By Harold Moore. Pp. 191, ill., index. D. Van Nostrand Co., New York. For sale by 'Mining and Scientific Press'. Price, \$5.

This book is divided into three parts. Part I discusses the different liquid fuels, including petroleum, shale-oil, and the various tar-oils, as well as the less important alcohols, animal and vegetable oils, and the products of the distillation of wood and peat. Part II classifies these oils according to their suitability for engines with carbureters and for Diesel and semi-Diesel engines with atomizers or vaporizers. Part III discusses the examination and testing of fuel-oils. An appendix contains a brief glossary, several sets of specifications, and some statistical and mathematical tables. The book is written from the viewpoint of the British user of fuel-oil, which interferes somewhat with its usefulness to the American reader. However, the American engineer whose interest in the subject is sufficient to counterbalance the relatively high price asked for the book will find it of value.

Petroleum. By Albert Lidgett. Pp. 165, ill., index. Isaac Pitman & Sons, London and New York. For sale by 'Mining and Scientific Press'. Price, \$1.

This is an attempt in a 'popular' book to cover, for the entire world, the various aspects of petroleum, including production, transportation, refining, and use. Naturally, the author's material, when spread out so thin, develops cracks in a few places. The book is written from the British standpoint, and is probably more accurate where discussing conditions in Great Britain and the British Empire generally than in other places. While some inaccuracies are, as already pointed out, probably the result of an attempt to

cover too wide a field, there are others that are caused simply by hasty composition. For instance on page 159, the estimated production of petroleum in Russia in 1917 is given as 69,000,000 bbl., while on page 165 it is given without any qualifying foot-note as 34,700,000 bbl. Nevertheless, the principal statements of fact in the book are correct, and the layman that wishes to learn these principal facts will find it of value. The man that wishes to study the subject thoroughly had better use a book not quite so popular in its treatment.

Walls, Bins, and Grain Elevators. By Milo S. Ketchum. Third edition. Pp. 546, ill., index. McGraw-Hill Book Co., Inc., New York. For sale by 'Mining and Scientific Press'. Price, \$4.

It is seven years since the second edition of Professor Ketchum's standard treatise appeared. The principal new material to be found in this edition includes data on the economic design of reinforced concrete retaining-walls, formulas for wedge-shaped reinforced concrete beams, formulas for calculating the load on bin-walls, the calculation of pressures in sand-boxes, problems fully worked out in the design of retaining-walls and bins, and the report on the design of retaining-walls adopted by the American Railway Engineering Association. In addition, there have been a number of minor changes. The book considers the design and construction of walls, bins, and elevators constructed of various materials, together with cost data and descriptions of actual structures. Like the previous editions, the treatise will prove a necessity for anyone engaged in that class of work.

Price, 15 cents.

INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

MOTOR-TRUCK FREIGHT AND OPERATING COSTS

By R. E. Fulton*

In handling freight by motor-trucks two principles are involved: first, service; second, cost. Every question in connection with the use of motor-trucks falls under one or the other of these heads.

In comparing railway freight-charges with motor-truck freight-charges it is necessary to include all the incidental items of expense connected with them. Sometimes manufacturers figure that a railway freight-rate of 50c. per hundred pounds is cheaper than a motor-truck freight-rate of 75c. per hundred pounds between the same points, whereas the freight-rate of 50c. does not include the expense of making the shipment, which starts with the boxing or packing cost, and incurs many other expenses until delivery is made to the receiver in good order.

The general traffic manager of one of the largest manufacturing concerns in the United States figured out what it cost them to ship freight by railroad and by motor-truck between various Eastern points. In railway freight cost he included the first-class freight-rate, by which their goods would have to be shipped, plus 15c. per 100 lb. teaming charges from shipper's warehouse to freight house, plus 15c. per 100 lb. teaming charge from freight warehouse to receiver's warehouse, plus 24c. per 100 lb. to cover increased cost of boxing and extra freight caused by the increased weight of heavier boxes.

Without including several other items of expense, this gave the following table of comparative freight-rates per 100 lb.:

| From | To | Via freight | Via motor truck |
|----------|--------------------|-------------|-----------------|
| Yonkers | New York | \$1.04 | \$0.20 |
| New York | Newark | .91 | .15 |
| " | Passaic | .91 | .18 |
| " | Paterson | .91 | .20 |
| " | Elizabeth | .91 | .20 |
| " | New Brunswick | .91 | .40 |
| " | Trenton | .98 | .60 |
| " | Philadelphia | 1.02 | .80 |
| " | Chester, Pa. | 1.05 | 1.00 |
| " | Wilmington | 1.13 | 1.20 |
| " | Coatesville | 1.15 | 1.05 |
| " | Port Chester | 1.02 | .63 |
| " | Greenwich, Conn. | 1.02 | .63 |
| " | Stamford, Conn. | 1.03 | .65 |
| " | Norwalk, Conn. | 1.06 | .68 |
| " | Bridgeport | 1.10 | .70 |
| " | New Haven | 1.13 | .73 |
| " | Derby, Conn. | 1.13 | .73 |
| " | Ansonia, Conn. | 1.13 | .73 |
| " | Shelton, Conn. | 1.13 | .73 |
| " | Naugatuck, Conn. | 1.15 | .74 |
| " | Waterbury | 1.16 | .75 |
| " | Meriden, Conn. | 1.16 | .75 |
| " | Hartford, Conn. | 1.21 | .90 |
| " | Springfield, Mass. | 1.25 | 1.00 |
| " | Holyoke, Mass. | 1.25 | 1.10 |
| " | Worcester, Mass. | 1.31 | 1.50 |
| " | Boston, Mass. | 1.36 | 1.50 |
| " | Providence, R. I. | 1.32 | 1.10 |

In addition to this, it is necessary in practically every case to prepare material for freight shipment in an entirely different way than when it is shipped by motor-truck direct from shipper to receiver. There is a considerable additional

expense for crating or other means taken to prevent loss or damage in transit. This extra expense is necessary because of the number of handlings less than carload shipments receive at the hands of the teamsters and carriers after the material leaves the shipping department. This increased protection and expense can be greatly reduced if shipments are made by motor-truck, as the packages only need protection for loading at shipper's warehouse, in transit without transfer, and unloading at receiver's warehouse. Then in shipping by motor-truck, instead of by rail, a great amount of clerical work in the form of extra bookkeeping, billing, etc., is eliminated. Where extra packing is necessary extra room is required for the boxing department. Then if railway freight shipments are delayed there is the additional trouble of tracing them. If the shipment arrives in damaged condition there is the further difficulty of collecting from the railroad company.

Contrasted to this is the example of Marshall Field & Co., who guarantee to make delivery within 50 miles of their store within 24 hours, so well is their motor transportation system organized.

Boxing often carries from 10% to 20% of its weight in moisture, unless it is kiln dried prior to boxing. The Otis Elevator Co. estimates that by the use of motor trucks it saves more than \$100,000 per year in lumber alone.

Delivery time is all in favor of the motor-truck, and if manufacturers will take into account all the costs and charges which are part of true freight transportation costs, they will find that motor-trucks can be operated successfully and economically in competition with railways for distances between 10 and 125 miles.

In figuring the cost of operating motor-trucks many of the systems in use are faulty, and thus overlook items that find their way into the expense account and often cause considerable loss. The following items indicate headings under which costs should be determined for each truck:

Data: working days per year; miles per day; miles per year; miles life of car.

Investment: chassis with standard equipment; body.

Fixed charges: interest on investment; insurance; fixed depreciation (exclusive of tires); wages; garage rent.

Operating charges: maintenance; tires; gasoline; oil and grease.

Total cost per annum; total cost per day; total cost per ton-mile.

Often trucks will do unusual mileage at surprisingly small costs for repairs. We frequently get letters about Mack trucks that have given exceptional service. One of these unusual cases is that of the 2-ton Mack operated by M. Mauro of Plainfield, New Jersey, which has traveled 45,000 miles with practically no expense for repairs. Another Mack in the service of the List Brewing Co. of Plattsville, Wisconsin, has traveled 30,000 miles and the only repair expense incurred was \$65 because the driver allowed the motor to freeze last winter. Such remarkable service as this cannot always be expected; but these instances serve to show the possibilities of a good truck if given reasonable care.

*Vice-president, International Motor Co.

GARFORD TRUCK HAULS LOCOMOTIVE

Proof that a motor truck of modern design and construction is capable of most any transportation task is shown by the accompanying illustration, which shows a Garford 10-ton

Garford 10-Ton Tractor Carrying Logging Locomotive

tractor transporting, with the aid of a trailer, one of the big logging locomotives used in the lumber camps of the North-West. The locomotive is the property of the Clipper Shingle Co., of Bellingham, Washington.

The company found it necessary to move this locomotive from one of its timber claims to another between which there was no connecting railroad. With the aid of a derrick the locomotive was lifted from its trucks, mounted upon the Garford tractor and the trailer and hauled over the rough forest roads to the scene of its future operations.

SHORTAGE OF RAILROAD CARS INCREASE SALE OF MOTOR-TRUCKS

The shortage of railroad cars, which is beginning to be seriously felt in many parts of the country, has already had its effect upon the sales of motor-trucks. In August the sale of Mack trucks alone increased 64% over those for July, and the sales for September continue at the same high rate. The large proportion of sales of heavy-duty trucks indicates that the buyers purchased trucks to enable them to haul large quantities of material that they evidently feel they cannot count on the railroads to handle.

Commenting on the situation, R. E. Fulton, vice-president of the International Motor Co., said: "There is just one solution to our present industrial troubles, and that is the production of necessary supplies on the largest scale possible, and their prompt, thorough, and efficient distribution. Through its transportation efficiency and economy, the motor-truck is giving material aid in advancing both production and distribution. Reliance on motor-trucks will become more imperative with the coming of cold and unfavorable weather."

FIRST CALIFORNIA HIGHWAY MOTOR TRAIN

Under the auspices of the San Francisco Motor Truck Distributors there started from San Francisco on September 25, what is known as the First California Highway Motor Train. This train is to proceed to Los Angeles, stopping at all of the larger cities en route and will be composed entirely of trucks carrying freight for delivery to Los Angeles merchants. The 'ship by truck' idea has been gaining in prominence for some time, particularly in California, where there has grown up a network of efficiently operated automobile stage and truck lines. Truck transportation brings in a new

era of moving goods, in which the motor-truck stands shoulder-to-shoulder with steam in national commerce.

Entries for the motor train were confined to distributors, or in the absence of available units for entry, the dealer or distributor was permitted to enter owner's trucks. The convoy is under the direction of a train commander, and for this purpose L. A. Nares, former president of the State Automobile Association, and a prominent 'good roads' man, was chosen. Mr. Nares will make addresses at the various cities on the subject of good roads, and other speakers will put forth the doctrine of 'ship by truck'.

Lavish entertainment will be furnished en route. On arriving in Los Angeles a banquet will be tendered by the automobile interests there to those who have made the trip. A fleet of trucks will meet the San Francisco train some distance from Los Angeles and escort them to the city.

It is expected that this will be the first of many similar trips of this sort and that the increase in truck movement of freight will parallel highway development throughout California and the Nation.

ORONITE ROOF PAINTS MAKE ROOFS LIVE LONGER

The roof of a building is undoubtedly its most vital part; it has often been said that a structure is only as good as its roof. In order to protect the contents of the building the roof must be kept in perfect repair, and a good paint, such as Oronite roof paint, has been proved the best means of obtaining this object in the case of most types of roofs. Many industrial plants are using Oronite roof paints not only for painting both metal and prepared roofing, but also as a protective coating in all cases where an extra heavy or thick coating is necessary. Other plants are using this paint for repairing old paper roofs that have got into bad condition. In this connection it has given perfect satisfaction when used for patching holes in old roofs. Not only has Oronite roof paint been widely used as a preservative coating on top of new and old roofs covered with ready roofing, but it has also been found an excellent binder between and on top of roofing felt and ready roofing, forming what is commonly known as 'built-up' roofing.

This paint possesses certain qualities which have made it useful in many other ways than on roofs. It is suitable for patching tennis courts and paths when mixed cold with mineral aggregate. A certain sugar company in California uses Oronite roof paint on pipe-lines at its plant with excellent results. A copper company in Arizona is using it for protecting fuses in wet holes. The company states that it is the best material it has ever found for the purpose, as there has not been a missed shot since its use. Another use of Oronite, and one for which it is excellently suited, is on cuts, abrasions, and wounds of trees. Many municipalities are employing it for this purpose.

Oronite roof paint is one of the most useful of the different kinds of Oronite paints. Its high quality and many other advantages make it a necessity wherever a preservative paint is needed.

TRAILERS AND TRAILER PARTS NOT TAXABLE UNDER REVENUE ACT

Regulations No. 47 relating to excise taxes states in Article No. 12:

"Automobile trucks and automobile wagons: The tax is 3% of the price for which automobile trucks and automobile wagons are sold by the manufacturer. An automobile truck or automobile wagon is a self-propelling vehicle primarily designed or adapted for the transportation of property. The act specifically exempts tractors, even if sold in combination with a trailer."

Article No. 16 further states:

"Automobile trailers, regardless of the number of wheels

which they may have, are not parts of or accessories for automobiles; but rear portions of automobile trucks, automobile wagons, or other automobiles, not properly called trailers, are taxable as a part of the automobile."

The last sentence relating to rear portions of automobile trucks is supposed to refer to truck units.

PRINCE OF WALES VISITS SULLIVAN DRILL

In June of this year the Prince of Wales, who is also the Duke of Cornwall and Devonshire, visited the Kit Hill mine in Cornwall, and was much interested in the operation of a Sullivan diamond-drill. Because of the enterprise of the Duchy management in installing up-to-date machinery, these mines are providing valuable quantities of tin and wolfram, the supplies of the latter having proved of great national service during the War. The new Sullivan diamond-drill, which began its work of boring on May 28, takes out a 1-in. core. The average speed is 12 ft. per day for horizontal holes in single shifts. The Prince spent some time watching the drill at work and displayed a keen interest, asking many questions relative to the mechanism.

COMMERCIAL PARAGRAPHS

Frank O'Ryan has been appointed district manager for the Allis-Chalmers Mfg. Co., Denver, Colorado.

During July of this year exports of pumps and pumping machinery from the United States amounted to \$671,047. In the same period the exports of mining machinery totaled \$653,286.

The Albert P. Hill Co., Inc., of Pittsburgh, Pennsylvania, announce that their offices have been moved from the Peoples Bank Bdg. to new and larger quarters, the entire top floor of 233 Oliver Ave., where their growing business will be taken care of with enlarged facilities.

On October 1 the Chicago Pneumatic Tool Co. will remove its Birmingham office from 801 Brown Marx Bdg., Chicago, to 1926 Fifth Ave., North, where a service station with a complete stock of pneumatic tools, electric tools, air-compressors, oil-engines, rock-drills, and repair parts will be maintained.

The Consolidated Mining & Smelting Co. of Canada announces that on and after October 6, 1919, the head office and general sales office will be in the Drummond Bdg., 511 St. Catherine St. West, Montreal. The Ontario sales office will be continued in the Canadian Pacific Railway Bdg., 69 Yonge St., Toronto.

A reprint of Allis-Chalmers bulletin No. 1411 on modern rock-crushing plants has just come from the press. Gates gyratory crushers, revolving screens, and elevators, with accessory parts, are taken up in order, followed by detailed drawings in plan and section of numerous rock-crushing plants of approved design in operation in various parts of the country.

Earl E. Eby, sales manager for the Hyatt Roller Bearing Co., Industrial Bearings Division, has been appointed to the board of directors of Hyatt, Ltd., a new company formed to market the Hyatt bearing in Europe. Mr. Eby will devote his entire time to this work with headquarters in New York. G. O. Helmstaedter, formerly Chicago district manager, has been promoted to the position of sales manager to fill the vacancy.

Ernesto Barrentes, ship engineer for Alberto Fait & Co. of Puntarenas, Costa Rica, recently arrived in the United States where he is inspecting oil engines to be used in marine work. Fait & Co. purchased a number of 75-hp. 'Western' Diesel engines manufactured by the Western Machinery Co. of Los Angeles, a short time ago, for use in its 300-ton boat 'Rossini', and Mr. Barrentes' trip primarily is for the purpose of working on these engines during the process of manufacture so as to become thoroughly familiar with their

construction and operation, and also to secure delivery of the engines at the earliest possible moment. The 'Western' engines purchased by the Fait company are vertical, single acting, four-cycle, enclosed crank case, medium speed, heavy-oil type, three cylinders of 25 hp. each. These engines are being used in many parts of the world now, according to the Western Machinery Co., which states they are adaptable to all power purposes.

The Lidgerwood Mfg. Co., of New York, announces the opening of a branch office in the Hammond Bdg., Detroit, Michigan, for the sale of its contractors hoists, derricks, and cableways, mine hoists, ship's winches and steering gear, and logging machinery. R. S. Hutchinson, formerly of the Lidgerwood office in Philadelphia, will have charge of the Detroit office, under the direction of F. B. Knight of the Lidgerwood Chicago office, who previously handled this business in Detroit.

Announcement is made by the Williamsport Wire Rope Co., Williamsport, Pennsylvania, of the establishment of a branch office and warehouse at Chicago under the direction of C. M. Ballard, formerly connected with the Williamsport organization at Cleveland, Ohio. The Chicago office is at 122 South Michigan avenue and the warehouse at 755 West Quincy street. This new Chicago branch is the latest step in the development of the Williamsport's distribution organization. Increased demand in the Middle West for a wire rope made by a concern which draws its own wire and therefore controls the quality of every grade of its product, has made possible this improvement in service to the Chicago district. The new warehouse carries one of the largest and most complete lines to be found anywhere. It is stocked with every kind of rope manufactured by the Williamsport company, with the result that the concern now can guarantee immediate shipment from Chicago to customers in the territory served from that point.

A. A. Schneider, formerly with the raw materials department of the Midvale Steel & Ordnance Co. and Cambria Steel Co., has been appointed manager of the newly created raw materials division of the American Steel Export Co. Prior to entering military service in 1917 as a Lieutenant of Field Artillery, Mr. Schneider had, for several years, been assistant to H. F. Black of the Midvale and Cambria companies of Pittsburgh, and carries with him to his new post a wide experience in, as well as a large acquaintance with, the raw materials and metals trades. In his new field, Mr. Schneider will handle imports, exports, and domestic sales of pig-iron, manganese, chrome, and low phosphorus iron-ores, ferro-alloys, coal, and coke. Although the development of markets for these commodities, particularly in foreign fields, is a new undertaking for the American Steel Export Co., the volume of recent over-seas inquiries, particularly on irons, renders the outlook for the immediate future optimistic.

The Denver, Boulder & Western R. R. has been purchased by the Morse Bros. Machinery & Supply Co., of Denver. This road, 49 miles in length, situated in Boulder county, connects Ward and Eldora with Boulder, and is the outlet for practically all the mining towns and districts in Boulder county. It is a narrow-gauge line, laid with 56-lb. rail, and is completely equipped with 8 locomotives, 90 freight cars, passenger coaches, etc. The Morse Bros. company has offered this road to the mining men and commercial organizations of Boulder county, at a price considerably below its scrap value in order that the road may remain and be of service to the community. An earnest effort is being made by these organizations to save the road from being taken up. The cost of the road was considerably over a million dollars. Permission has been given the owners by the Public Utilities Commission of Colorado to dismantle the road, which will be done at once in case the Boulder organizations and men are not sufficiently interested to save it.

G-E Motor Drive at smelters and concentration plants helps labor accomplish more.

Dependable G-E Motors Drive Hundreds of Mills

AT one mining company, mills that operate twenty-four hours a day for long periods are driven by individual G-E motors which require little attention. Two men per shift can operate sixty-four mills.

For this, the largest installation of its kind in the world, G-E 40 h.p. squirrel cage induction motors were selected. These motors have high

efficiency—so important for long-period operation—and the required high starting torque.

Among those using these motors are the Calumet and Hecla Mining Company, Anaconda Copper Mining Company, the Inspiration Consolidated Copper Company and others equally well known.

43-282

OUR contemporary in New York is compelled to replace its usual issue with an emergency bulletin of four pages, on account of the printers' strike, which has stopped the publication of some two hundred periodicals in New York. In the latest of these bulletins, the new editor of the 'Engineering and Mining Journal' prints his salutatory, which we find interesting. We extend our sympathy to Mr. J. E. Spurr in having to start his career as an editor under such untoward circumstances. The strike in New York can benefit nobody; it is an intolerable outrage, against which the public should support the publishers wholeheartedly.

STATISTICS are synonymous with verbal inexactitudes. We read in the 'Saturday Evening Post' that according to the new edition of Lloyd's Register, Great Britain lost 2½ million tons of shipping between June 1914 and June 1919; on the same day we read a cablegram from London appearing in the daily press stating officially that Great Britain lost 7,759,090 gross tons of merchant shipping during the War, and that, of this total, 6,635,059 tons was lost by submarine attacks. Also that 14,287 lives were sacrificed. Incidentally, these figures testify once more to the tremendous losses incurred, in life and material, by England in the war with the Hun.

THEODORE PRICE, a press economist of recognized standing, has computed that the combined effects of war, influenza, the adoption of the shorter working day, and the prevalent strikes have caused a decrease, since July 1914, of 40% in the world's output of the things that are necessary. This would account for the high cost of living, but to it we must add the increase of luxury among the laboring classes as their wages have increased and the extravagance of those who made money by profiteering during the War. This free spending of money among those to whom the War was a cause not of misfortune, but of fortune, is a glaring fact as much in Paris as in New York, in London as in San Francisco. It should be condemned by all good citizens.

PEACE hath her victories no less renowned than War" and men of peace are privileged sometimes to receive the acclaim of marshalled legions. On Mr. Hoover's last visit to Warsaw the Poles desired to do honor to him and to express their gratitude to the United States for food and other economic aid so freely given.

Mr. Hoover and his commission were called upon to review a procession of 45,000 children, barefooted and in tatters, but each carrying an American flag in paper. They walked past for seven hours and then the police had to stop the procession. General Henri, a French officer present on the occasion, said that he would rather have received the salute from that army of children than from any army that had been formed in the Great War. May those children live to love in their manhood and womanhood the American flag, and may our great exponent of economic strategy live to see a happy and contented Poland.

NOVEMBER 1 is the date set for a general strike in all the bituminous coalfields. The strike has been called by the United Mine Workers of America in order to enforce a new scale of wages in the central competitive coal district. An agreement exists between the workers and the companies, and it does not expire until April next, yet the labor agitators ignore it, making demands so excessive as to menace the very existence of the coal industry. They demand an increase of 60% in wages, a 30-hour week, 50% additional pay for over-time and 100% additional for Sundays and holidays. It is estimated that, if accepted, these demands will add \$2 to \$2.50 per ton to the present high cost of coal, placing an intolerable burden upon those already oppressed by the high cost of living. The threatened strike forms part of the movement among the radical and irresponsible elements of organized labor to oust their conservative leaders and to apply the teachings of the Russian revolution in this country; it is a plain defiance of public opinion and of the welfare of millions of plain people.

AMONG the undesirable terms creeping into the technology of mining is 'commercial,' as applied to pay-ore. In a recent bulletin of the U. S. Bureau of Mines we read of "new commercial deposits," the reference being to fresh discoveries of ore or newly discovered ore deposits. The word 'commercial' in such a context pleases the promoter of wild-cats because it smacks of regular business; it suggests direct economic exchange. Ore is not an object of commerce; it has to be mined, milled, and smelted before its valuable contents are marketable in the true sense of the word. "Commercial deposits" evokes the image of the receiving teller in a bank, not a mass of metal-bearing rock, possibly in a locality far from any bank or bourse. As used by the

miner, and therefore by a Bureau of Mines, the word 'ore' connotes a profit, simply because the digging of ore is done for gain. The gentlemen of the Bureau should set a good example in these matters, not follow the bad example set by illiterate or irresponsible persons.

IT has been suggested, in the 'Manufacturers Record,' that no alien should be allowed to belong to a labor or political organization. Is not this a bit drastic? If an alien gives his work to American industry, he should be free to form any law-abiding labor organization he pleases, otherwise what happens to our ideal of an equality of opportunity? His status is that of a workman, not a citizen. Political participation is a different matter. If he is not a citizen of this country and has given no evidence of his desire to become one, by the formal declaration of his intention, he ought to abstain from interfering in affairs that are none of his. With that we agree. Failing to become a citizen, or even a near-citizen, he has only the privileges accorded to him under the treaties existing between the United States and the country of his origin; these include membership in law-abiding labor organizations, but it may be observed that they do not include participation in sabotage or in strikes that are unblushing attempts to upset American life by forcing upon us the repulsive doctrines of the anarchist. Indeed, it is high time that the political excitations of aliens were restrained and that they were prevented from disrupting American industry; but in all such matters we must be just, lest we play into the hands of the reactionary element, which is as destructive of American ideals as the anti-social forces now rampant in the United States.

FROM the Philippine Islands we have received a letter drawing our attention to a circular issued by the Army Man's Leasing Company, inviting subscriptions to stock in a company that controls the lease of a block of land in Texas that may possibly prove oil-bearing. The prospectus says plainly that the chances of making money are not limited to the finding of oil, but they lie largely in the opportunity of selling the land, now held under option, at rising prices as the drilling of a well proceeds and before this drilling has been completed. The cost of sinking this well 4000 feet is to be met by the sale of land on the outer edge of "our holdings." The morality of this may be debatable; if the facts are stated frankly and if people are willing to take part in such a gamble, it is their business, not ours; but the propriety of using army comradeship for the purpose of company promotion is another question, concerning which there can be no doubt. The promoters have secured army-lists and have written to officers, at Camp Eldridge, for example, asking them to buy stock. The directors of the company hold commissions in the Army or they held commissions recently, it is not clear which. It is asserted that "they will receive nothing but dividends on stock that they have bought and paid for until each and every stockholder has received 200% in dividends." A subscriber, a lieutenant in the Engineers,

writes to us to protest against this method of solicitation. He suggests that the proposal has "all the earmarks of a wildcat." It has.

FLYING by aeroplane is a hazardous business, if one is to judge by the results of the so-called race across the continent. Out of 62 who started, 7 were killed, besides three who were not flyers. At the end of ten days, only 11 air-men had made the crossing and about twenty machines had been smashed. The winner, Lieutenant B. W. Maynard, made the round trip, from ocean to ocean, in 10 days, which is longer than it would have taken to transport him and his machine on a train from New York to San Francisco and back again. His actual flying time was about 25 hours each way. Surely the cost in human life has not been justified by the results. We note with interest that the Associated Engineers of Spokane, on October 18, passed a resolution protesting against the exhibition and asserting that the deplorable fatalities are likely to injure public confidence in legitimate aviation. A Brigadier General states solemnly that "the air derby plainly demonstrates that the isolation of the United States with respect to Asia and Europe is completely broken down." Not nearly so completely as a dozen or more aeroplanes. The whole affair was ill considered and unproductive. We hope that it will not discourage the further development of an aviation corps, alike for commercial and military purposes.

IN the 'New York Times' we find an interesting editorial article, 'Who Invented the Tanks?' Mr. Winston Churchill and Colonel I. C. Welborn, Director of the Tank Corps of the United States Army, are quoted, and it seems agreed that the idea of using the Holt farm tractor originated from "a representative of the British government" who happened to see a demonstration of the machine "in one of the large German cities about 1913." It is a matter of interest to us not only that the tractor in its agricultural phase came from Stockton, California, but that the observer who was the first to realize the practicability of using it as a moving machine-gun fort was a mining engineer, Mr. Hugh F. Marriott, formerly in South Africa and recently president of the Institution of Mining and Metallurgy, in London. General E. D. Swinton, the British officer responsible for the successful adoption of the caterpillar tractor for military purposes, has acknowledged that the idea was first suggested to him by Mr. Marriott, who, in a letter written in July 1914, told him how he had seen the tractor going over rough country and climbing "like hell". Upon the receipt of this letter Major Swinton, as he then was, set to work to devise a bullet-proof machine suitable for attack upon the German machine-gun positions, and in order to keep secret his construction of these new engines of warfare he let it be supposed that they were intended to be motor-tanks for supplying water to the troops in Egypt. When, later, holes had to be punched through the tanks in order to make way for the muzzles of the guns, it was made known that snow-plows were to be fitted to them in preparation for using them on the

Russian front, and a Russian address was stenciled on them. The secret was well kept and the Germans knew nothing about the tanks until they came lumbering upon them at Delville wood like monsters from the primeval slime.

What Shall We do With the Treaty?

In one of his recent speeches in San Francisco Mr. Hoover described the state of affairs in Poland, asserting that the conditions existing today in Kosciusko's country are typical of the plight of the other new nations created by the Peace Conference. For a century and a half the Poles have struggled to emerge from under the heel of autocratic foreign control in order to establish their independence and assert their national ideals—the ideals of liberty that they have derived largely from the United States. After the Armistice they obtained financial and economic aid—milk for the children, locomotives for the railways, men for the new government—from our people, for whom Kosciusko and other Poles fought during our own revolutionary war. Paderewski returned home inspired by American ideals and fortified by American ideas. Without sending a soldier to Poland, the United States gave powerful aid to the emancipation of the Poles. In the same way the other insurgent peoples of the little countries of Europe have been inspired by dreams of independence brought to them from across the Atlantic. "For 150 years," exclaimed Mr. Hoover, in a rare burst of emotion, "we have stimulated these peoples with ideas of freedom and democracy; shall we abandon them now?" He answered the question himself in tones of deep deliberation: "We, who have been the advocates of human liberty, cannot stand aside after inciting these peoples to self-government; we cannot desert them after we have launched this world-wide effort for freedom." Are we to wash our hands of the mess in Europe and turn our backs upon the welter of confusion and misery that has followed in the wake of the Great War? "Yes," say some. Senator Johnson has said that he does not see why this country, solvent and prosperous; should tie itself to the bankrupt countries of Europe. He does not see why, after fighting with the Allies against the Central Powers, we should bother ourselves further about the fate of our late partners in the cause to which we committed ourselves so belatedly but so decisively. He has no qualms of honor on the subject nor any idea that such a course of action may hurt not only the self-respect of the American people but their commercial prosperity also. One of our local newspapers, 'The Chronicle,' said a few days ago that "we shall doubtless get on very nicely without the Treaty," adding that "the really important thing just now is for everybody to get to productive work." The pity of it! We exported six billion dollars worth of merchandise last year, and imported three billion dollars worth; does the editor of 'The Chronicle' suppose that there will be much "productive work" if our customers are ruined and our markets destroyed? There are those who seem to argue as if the United States were an island, detached

and self-contained, in the midst of the Pacific Ocean. The nations of the world today are more like a shipwrecked crew on an island where they are beset by natural enemies against whom they must unite in common self-defence. A dweller in Mars or the chief dweller in Hell might well be moved to sardonic laughter if he read these admonitions of complacent and unadulterated selfishness. "It may be the best thing in the world for us to forget the whole business for a while," says the same editor. He and others like him tried to "forget" the European war until the brutal logic of events drew us into it. Does he imagine that this country can be happy and prosperous while Europe, the mother of the United States, goes down in political and economic ruin, to riot and starvation? Mr. Hoover, the most trustworthy economic authority in the world today, says, "Economic demoralization is coming to this country unless we open markets in Europe." Again: "Even if we keep our soldiers out of it, we shall not escape fearful economic losses." Unless we supply credit and raw materials to Europe, and maintain economic relations with the Old World, we shall suffer as they are suffering. Economic relations cannot be maintained until peace is established and the changes authorized by the Paris Conference are stabilized through the League of Nations. Neither the Treaty nor the Covenant is perfect, for no settlement of the post-bellum affairs of Europe, Asia, and Africa is conceivable that could please everybody concerned. If 500 selected men working for seven months did no better, what would be the result of re-drafting either the Treaty or the Covenant by the diets, parliaments, and congresses of the allied nations? Meanwhile armies are massing again on the eastern frontiers of Germany and economic chaos threatens central and eastern Europe. Cesspools of disaffection are being created, and their infection is already spreading to our industrial centres, where alien workmen, the children of Europe, are fluttering the red rag of anarchy. We cannot fumigate the breezes that blow across the Atlantic. We are part of the civilized world, recently fallen into savagery and now tottering to economic ruin. Isolation is the dream of a madman; economic detachment is the thought of a fool. "To believe that, through the breakdown of this treaty, our neighbors can return to a thirty years' war while we maintain our progress is the egotism of insanity," again says Mr. Hoover. We need not send a soldier to Europe, we need not give military aid to anybody, but we cannot draw back in vacuous aloofness from the spectacle of a world in travail. "Am I my brother's keeper?" asked the first murderer. "He passed on the other side" is recorded of the Pharisee. Shall the nation founded by the heroic soul of a Washington or the people glorified by the tender compassion of a Lincoln turn a deaf ear to the call of humanity in this dark hour? No; by the gallant dead that lie in Flanders field, No! Our Allies have ratified the Treaty; shall we, whom it affects so much less, hold back longer than they? Let us ratify the Treaty and then use the machinery of the League to remedy its defects, pulling

together in a helpful spirit of compromise to attain a settlement that shall restore the world to peaceful industry and set anew the foundations of civilization.

Class Journalism—II

In the preceding article on this subject we referred to the fact that the editors of trade and professional papers are usually recruited from the class to which the paper makes its appeal; for example, the editors of the mining journals were mining engineers before they became journalists; the editors of the electrical papers were engaged in the electrical industry before they ventured to address those specially interested in the vast business created by the application of electric power to every kind of machinery. It is the essence of class journalism that it is founded upon an experience that has been shared alike by the writer and the reader, so that mutual sympathy exists. We need not belabor this point further; it will be readily acknowledged; but we lay stress upon it in order to bring into relief the fact that the publishers of class journals are usually without such ties with their clientele. They are speculators or investors, according to the varying degrees of risk incurred in the business. They bring capital and executive ability to the publishing trade; for it is a 'trade' in so far as the making of money suffices to sustain it. It is not a 'profession', because it is not based upon a special education. That is one of the weaknesses of their position, as the controllers of class journalism. They are in touch rather with the manufacturers who advertise with them than with the class that their periodicals are aimed to please. The publishing business is speculative and it has attracted men of great force and initiative, from engineers to school-teachers, to whom the printing of news and information is attractive because upon it they can build a business to which the arts of salesmanship can be applied successfully. In their natural enthusiasm for the selling of their advertising space they are prone to under-value the reading matter on which their whole commercial structure depends. They construct an elaborate selling organization to gather the fruits of the publicity offered by their papers, but under-estimate the need for supporting their selling campaign by establishing an editorial department that can 'make good' at the other end—the vital end—of their business. They put the cart before the horse; or, if you will, they paint their wagon gaily and spend money lavishly on its equipment, and then put any sort of horse between the shafts, expecting to bring a large load to market. Their advertising agents are better paid than their editors. Indeed, it is one of the anomalies of democracy that such instruments of education as newspapers and magazines should be controlled by men to whom their educative function is a matter of minor importance. That a man like Hearst should control seven newspapers and eight magazines is a satire on democratic idealism. It is likewise strange, but not objectionable in the same way, that men having no knowledge of engineering, and no

particular sympathy with the engineering class, should control most of the engineering periodicals. They, as speculative publishers, have the hankering of their kind to control the field of business activity in which they are working; so, ill content with one paper, they cherish the ambition to own a string of them, with a view to ultimate monopoly in their particular field. This leads to consolidation and syndication, for the purpose of creating an artificial advantage, namely, a magnified machine-made organization and an elaborate system of solicitation for business. The system and the organization are marvelously well done, but they have the defects of their qualities. Personal character is sacrificed to mass action; the soul of a man becomes the cog of a wheel. The morale of their staffs suffers, of course; for personal leadership is subordinated to committees and boards; the vast mechanism of the business is too much for personal supervision; the machine runs ruthlessly and without regard for human amenities. The fetish of bigness is an ugly monster with an umbilical eye. The syndication of class journalism has been a striking feature of the last two decades, and it bodes no good to the readers of this branch of periodical literature. Naturally, the reaction on the editorial departments has been bad. The emphasis placed on the selling organization has tended to belittle them; the speculative publisher is inclined to regard the editor as a necessary evil; he would love to do business without the fuss of preparation required to place suitable reading matter between the fore and aft sections of his advertising supplement. In consequence, the position of the editor has lost attractiveness; not many men of high character and wide experience find it comfortable to take charge of the literary portion of the publicity business. The publishers do not dictate the editorial policy, it is true, because they take too little interest in it, except when it impinges upon the self-interest of an advertiser. The editor may irritate a few readers with impunity, but he will not fail to hear from the powers above if he annoys a single advertiser by inadvertent criticism in the course of a technical article. The place given to the editor in the syndicated organization is not pleasant; he finds himself only a pinion engaging with other and larger wheels. His tenure is precarious, because it is not fixed by personal obligation; he is dealing with a machine, not a man. Unfortunately the capital involved in the publishing of a class journal nowadays is so considerable as to debar most editors from owning their own papers; the man with a literary bent and a critical faculty is not often a maker of money, and when he is, he is unlikely to be diverted to journalism. On the other hand the successful engineer, electrician, or architect is not attracted by a position that makes him a part of a commercial mechanism; he prefers consulting practice. This is where the syndicated form of class journalism is weakest; it prides itself upon the elaboration of its organization; it views with complacency the subordination of the individual to the machine; but it overlooks the fact that character is individual and the sale of publicity is the effect, not the cause, of printing the living word.

DISCUSSION

Labor Conditions in Australia

The Editor:

Sir—Having recently spent some time in Australia and New Zealand while *en route* from India to California. I thought that perhaps a short account of the labor conditions now prevailing at the Antipodes might interest you. I should explain that owing to the number of people waiting at Hong Kong and Shanghai to cross the Pacific I was unable to get a passage to America by that route, so I decided to proceed to Australia and take my chance of a passage from there. At the same time I knew that I was liable to be held up there by strikes and in this I was not disappointed. It took me four months to reach America from India. It happened to be the seamen's turn to take a holiday, with the result that no steamers except a few ocean liners were plying round the coast of Australia, and between Australia and New Zealand, Tasmania, Fiji, and other Pacific islands. Many New Zealanders, including returned soldiers, were stranded in Sydney and Melbourne. In addition to this, the two steamers of the Canadian-Australasian Line, being manned by Sydney crews, were laid up on their arrival from Vancouver. The steamers of the Oceanic Steamship Co., being manned by American crews, were not affected, but they were booked up months ahead. There was a scarcity of sugar, salt, etc., in Sydney and of flour and other foodstuffs in north Queensland. In these circumstances, the Queensland Government dredge was loaded with 200 tons of flour, but when she was ready to sail for northern Queensland seven of the firemen walked ashore with their kits. Mr. Hughes, the Prime Minister of Australia, was on his way back from the Peace Conference, and in his absence the Australian government seemed to be afraid to do anything toward settling the strike until it had been going on for about seven months in Queensland and four months in New South Wales and Victoria. The ships are supposed to be under the Shipping Controller, who is an Admiral. There are thousands of unemployed in Australia and surely a sufficient number of non-unionists could have been obtained who could stow cargo and fire a boiler. But Australia is so completely in the grip of the labor-unions that no one even suggested this way out of the difficulty, although it was done some years ago when the unions refused to load the transports going to Europe. Of course, the strike affected others besides the seamen and firemen, namely, ship's officers and engineers, stewards, wharf laborers, teamsters, coal miners, and smelters.

In striking, the unions were defying the law, as they were or should have been working under an award of the Arbitration Court which had not expired, and were consequently liable (in theory) to be fined. After considerable delay the Secretary of the Union, named Walsh, who is married to one of the notorious English Pankhurst family, was tried and fined \$500, which he refused to pay and would not allow the Union to pay. As he still persisted in defying the law, he was fined \$1000 more and awarded three months imprisonment, but without hard labor. In fact, after a short hunger strike *à la* Pankhurst he spent the time in the jail hospital where the food was better, but the strikers announced that they would not return to work until he was released. The Union and its president were also summoned, but the case against them was adjourned from week to week, and by the time the strike terminated nothing had been done. If, on the other hand, the employers had been at fault, no time would have been lost in summoning and punishing them. Such is life under a Labor government in Australia. Compulsory arbitration has had a thorough trial there and has been a complete failure. During this strike even the strikers announced that they would have nothing more to do with it, although, under Judge Higgins, the unions have almost always succeeded in getting better conditions. This time their demands included an increase of 35 shillings per month and better accommodation. As you are aware, this is not my first visit to Australia and these are not hasty impressions. I have lived there for more than ten years and in New Zealand for five years.

Owing to this strike, 25 ships belonging to the Commonwealth government were laid up in Australia at an estimated loss of \$50,000 per day. The long-suffering public, of course, will have to bear this loss. One would think that in these circumstances the Government would do its best to settle the strike. I cannot imagine the American government allowing 3000 men to hold up the trade of *this* country.

After the strike had been in progress for some time the union organized gangs of strikers to go up country rabbit-catching and other parties to go out deep-sea fishing to raise money to further the good cause. Every Sunday crowds gathered in the parks to listen to loud-mouthed speakers and the hat was passed round for the benefit of the suffering wives and children of the strikers. Soup-kitchens were also opened, to enable the lawbreakers to hold out longer. Incidentally I may mention that saloons in Sydney close at 8 p. m. now.

While the shipping strike was raging there was a

miners' strike at Broken Hill, but as this is almost a chronic condition there it did not attract much notice in Sydney. All they want is a 6-hour day, 5 days a week, \$5 per shift as a minimum wage for men and boys. At that time there was 100,000 tons of lead lying at the Port Pirie smelter, where most of the Broken Hill galena concentrate is smelted. This accumulation was caused by scarcity of shipping space. At the same time most of the copper mines in Australia were shut-down for the same reason or because the cost of production was too high to leave any profit. Scarcity and inefficiency of labor were chiefly responsible for this. Other companies complained that the Metals Exchange would not allow them to sell their copper.

The Mount Morgan mine shut-down because they could not ship blister copper to the refinery at Port Kembla on account of the shipping strike, and it cost too much to send it by rail. The Queensland government compelled them to resume operations under threat of taking possession and working the mine itself! The Broken Hill Proprietary Co.'s iron and steel works at Newcastle, N. S. W., were shut-down because they could not get iron ore from South Australia, limestone from Tasmania, and coke from the Illawarra district of New South Wales. The electrolytic copper refinery at Port Kembla was idle because they could get no blister from Mount Morgan or Mount Lyell and the custom-smelting department was idle because no purchased ore was coming forward. This company had 12,500 tons of wire-bars and ingots worth more than £100 per ton on hand in July because it could not get permission from the Shipping Controller to ship to England, though most of it was sold to the British government. The same condition prevailed at Port Pirie and Cockle Creek as regards lead and zinc.

At the Mount Morgan mine during the last half-year, figuring on the directors' report, the cost of producing a ton of blister copper was about £143 (\$610). Fortunately for them they can produce blister carrying \$400 worth of gold per ton. At Wallaroo, in South Australia, costs are £90 per ton of blister copper. At Mount Morgan there was a strike because a returned soldier was given a job in the mill, although the man he displaced was given another job. The manager told them that if they didn't return to work in two days he would close the whole works down. They returned. They are just like children.

Under the coal and coke workers award, coke-wheelers get 14s. 7d. per day. Some mechanics at Port Kembla gave up their jobs to go coke-wheeling.

The State of Queensland made a loss of £1,500,000 on its railroads last year and one of the ministry (who are Irish laborites) said he didn't think they should be expected to pay. They also made a loss of £45,000 in 3½ years on the State coal mine and closed it down, but they now intend starting an iron and steel industry. They have also bought the mines, railways, and smelter of the Chillagoe company, which has spent millions on them in the last twenty years and never paid a dividend. They intend to spend \$500,000 in opening the Einasleigh

mine and putting the smelter in order. There is no chance of making a genuine profit. I have been there. They are also opening up a State arsenic mine to make a mixture to kill the prickly pear! Can you beat it!

At the Mount Elliott smelter in Queensland the furnace-men went on strike because they did not approve of the management lengthening the furnace to 28 ft. To please them, the length was reduced to 18 feet. Could this happen anywhere else?

The shipping strike, according to the Sydney 'Sun,' caused a loss in wages of £1,363,000. How long will it take the poor fools to make up this, even if they get an increase? If they are not being paid a living wage how can they afford to be idle from four to seven months?

Some years ago the Kanakas who worked on the sugar plantations in Queensland were deported, and the 'white Australia' policy was initiated. The cane-cutting is done by contract and the laborers refuse to work unless they can make £2 or £3 per day. Consequently less cane is being planted now than formerly and sugar has to be imported from Java and Fiji.

At Broken Hill, after four unsuccessful attempts in three weeks at the South mine and two by the Zinc Corporation, certain persons succeeded in burning down the headgear, 130 ft. high, the ore-bins, and part of the mill at the Broken Hill South, which was idle on account of the strike. This was the only mine at Broken Hill that employed any hands—chiefly on repairs and to relieve distress, and was the only one picketed by strikers. The damage is estimated at £90,000 (\$400,000) and will take a year to replace. The Amalgamated Miners Association naturally deny that they had anything to do with it and insinuate that it was due to the carelessness of the management. The company offered a reward of £2000 for information leading to the arrest of the guilty parties.

About half the mileage of railways in New South Wales doesn't pay, but more roads are projected—with borrowed money, of course—to keep politicians in office. The same old game. They are even borrowing money now to *repair* roads.

At the Pelaw main colliery, in New South Wales, miners landed in trucks 2700 tons of coal in seven hours, earning over £2 per head.

In ten years Australia paid £625,000,000 for imports.

The miners at the Victorian State coal mine went on strike because the roads were muddy.

It is reported by the Commonwealth statistician that in six years up to 1918 there were 2153 disputes involving 7697 establishments. The workers numbered 9,156,589, and the loss of wages was £5,073,346. In 1918 there were 298 disputes.

The price of potatoes was fixed by Government at £18 per ton. And this is supposed to be an agricultural country! Wharf laborers at Wellington, N. Z., refused to load potatoes on an outgoing steamer. They said the export of potatoes was making the price high in New Zealand.

Australia's national debt is now £700,000,000 and its population about five millions. The debt per head is

£140. The Government tries to prevent capital from leaving the country; for example, the Austral-Malay company bought a tin mine in Bolivia, but the Government would not allow them to raise money in Australia to work it; consequently they registered a company in the United States at considerable expense, but have now removed the office to the Malay States.

It is well recognized that Australia is the working man's paradise and the educated man's purgatory. For instance, the Geelong Council advertised for an accountant at £156 per annum (10s. per day) and at the same time increased its laborers' daily wage to 10s. 8d. Many instances might be given of the same thing. In August last the Waterside Workers Federation applied to the Arbitration Court for more pay and improved conditions. The secretary said he thought it was quite right for men who started work at 10 minutes to 9 to knock off at 9 o'clock for a smoke. He also asked for treble wages for Sunday work with a minimum of four hours engagement, which might mean in certain cases—such as handling explosives—a wage of £2 13s. for half an hour's work! In the case of the gas employees, members of the union claimed to be paid interest equal to the dividend paid to shareholders, such interest to be paid on the wages earned. Even Judge Higgins balked at granting this demand.

In testifying before the Railway Appeal Board in Queensland, after the Railway-men's Union had warned its members to prevent a trainload of police from reaching Townsville during the riots, more than one unionist swore that he would have risked his life had he disobeyed the union and it was better to disobey his employers, namely, the State.

WILLIAM MOTHERWELL.

San Francisco, October 3.

Braden

The Editor:

Sir—Really, Mr. Editor, such misinformation as is given in the article on 'Mining at Braden' in your issue of September 20 needs corrections. I refer particularly to the following statement made in the article by Mr. Cameron:

"It is quite a well-known fact, that certain engineers employed by the New York office reported unfavorably on doing any development work whatever on the Teniente mine, as they stated that surface indications and all other information such as can be gathered from a visit to the deposit proved to them conclusively that although there was a large deposit of mineralized rock, still it never would be mined as ore, as it assayed not over 0.5% copper."

It is not clear whom Mr. Cameron means by "certain engineers employed by the New York office," but as a matter of fact Mr. Pope Yeatman, the company's consulting engineer, recognized at once the great possibilities in the Teniente section of the mine when he first examined the property in 1910, and so reported, and he continued to believe in these possibilities. He was assisted

on his first examination by Robert Marsh Jr., and on his second examination by Edwin S. Berry and Mr. Marsh, neither of whom were at that time "local officials of the mine," nor was Horace Graham until a considerably later date. The president of the company at that time, Barton Sewell, always had the greatest faith in the possibilities of the Teniente and was always anxious to have development work carried on in that section of the mine.

EDWIN S. BERRY.

New York, September 25.

The Handling and Smelting of Flue-Dust

The Editor:

Sir—I wish to submit for the consideration and criticism of your technical readers my proposed scheme for handling and smelting flue-dust. As far as I know, it is original, and, as I have not taken steps to patent it, the

FIG. 1

FIG. 2

smelting companies may freely work out and apply the system to suit their local conditions.

I would make one or more openings in the side walls of reverberatory furnaces (say, eight or ten inches in diameter) and through the opening insert a movable pipe or nozzle of molded magnesite or other refractory material, pointing the nozzle downward at an angle into the molten bath in the furnace as shown above in Fig. 1.

I would connect to the end of this refractory pipe, outside the furnace, a Koerting air-jet dust-conveyor or similar suitable injector of, say, 3 in. suction size, which would have capacity sufficient to drive 35 lb. of dust per minute into the molten bath. Suction-pipes to this injector would run from the bottom of the respective dust-hoppers so that the dust as deposited would be continuously 'sucked' from the hopper-bottoms and forced by the injector directly into the molten bath in the furnace without waste. At this point in the bath extra heat would be generated by the jet of high-pressure air. Consequently the intruding dust would be immediately melted and incorporated in the bath, and not carried out of the furnace again as dust, as in present practice.

If preferred, the system could be applied by running the refractory pipe through the roof of the furnace so that the stream of dust and air would strike into the molten bath vertically as shown in Fig. 2.

I should like an opportunity for trying this system for some interested smelting company. It would cost very little to do so.

How Tellurides Were First Found in Colorado

The Editor:

Sir—Away back in 1871 in the town of Boulder, Colorado, an old man, Lawrence Thompson, made a living by conducting a photograph gallery and assay-office combined. Neither gave a living alone but by combining the two he scraped through. I used to make his office a loafing place, often helping in the assay-office, and occasionally doing all the work when Thompson was busy elsewhere. I made my living in a printing-office. Men didn't know what a mining engineer was then. They thought he was a man who ran a hoisting-engine on a mine; and if they had known there would have been nothing to do for a boy but lately out of school.

One day, while the proprietor was absent and I was running the office, two German prospectors, Joe Steppler and Chris Halk by name, who had a claim called the Red Cloud, on Gold hill, ten miles distant, came into the office. Joe pulled out a chunk of ore weighing a pound and asked me to assay "this piece of gray copper." God Almighty in one of his manifold ways made telluride ore, but I doubt if he ever made a purer specimen than that was. As I remember it now, I'd be glad to give a hundred dollars, if I had it, for one like it. I was busy and didn't pay much attention; so I replied, "Buck it down, Joe." He had helped me doing such work before, and knew how. It is not surprising that he called it "gray copper," as that steel-gray mineral was the only thing anywhere near like it known to local prospectors. As for myself, I had never seen tellurium ore, and had only a hazy knowledge that there was a rare mineral named tellurium. Joe bucked it down, and I sifted it and weighed out the tenth assay-ton generally used for a scorification assay, the kind made then. Joe went away

and I finished the assay. I was astonished at the resulting button. It was yellow and as large as a goose-shot, with several little bright buttons scattered on the cupel to keep company with the big fellow. I weighed them all together. If it had been silver it would have been a tremendous assay. Joe came back and I gave him the results, whereupon he became 'mad as a wet hen.' He thought I was fooling him. To satisfy myself as much as him, I repeated the assay in duplicate, with results showing a close approximation to the first result. Then we held a council. I had never heard of ore so rich that did not show 'free', or visible, gold. Joe took my advice and carried some of the stuff to Prof. Schirmer, assayer in charge at the branch mint or Government assay-office at Denver. He named it the telluride of field. John Ruthman, a German druggist in Denver, bought the Red Cloud for \$25,000, and the news spread like wildfire. A boom began, but it took three years to get under full headway. This is the whole story of the discovery of tellurium and the first mining boom after the birth of the Territory of Colorado. It was not a great one, but it was interesting. The cream of the ore was mostly on the surface. A system of trenching was started along the outcrops of the veins, and I think most of them showed good ore somewhere on the surface. In sinking their 10-ft. discovery-shafts the American claim yielded \$17,000; the Grand View, Cold Spring, John Jay, and Melvina each gave \$10,000 or more out of their discovery-shafts. The true story of the discovery of the Melvina reads like a yarn. It is as follows:

A couple of 'tenderfeet', who could not tell quartz from granite, stopped at a mine cook-tent and asked to be shown a good place to discover a mine. Someone said to them, pointing to a pine-tree a little way off, "under that tree is a good place." They had a pick and shovel, so, taking off their coats they began to dig under the tree. The trail from the Hoosier mine ran close by the tree. I have often tramped it and know there was no more sign of an outcrop there than in a grassy meadow. When the tenderfeet had dug a shallow hole, not two feet deep, Henry Neikirk, a well-know miner, came walking along the path and stopped to see what they had found and talked with them. The day was warm and the tenderfeet complained about the unaccustomed work and heat. They did not know they had found anything, but Neikirk did. He offered to finish their shaft for what ore he took out, if he found any; and a half-interest in the claim. The proposition was accepted. The hole yielded over \$10,000, and in a year Neikirk was the director of a bank and walked on easy street. The American mine sold 40 tons that averaged over \$5000 per ton. Some of these mines are still being worked, but their glory has departed.

W. C. WYNKOOP.

San Francisco, October 10.

THE U. S. Geological Survey now has available for distribution its annual statement on cadmium in 1918. The production in 1918 fell off considerably in both quantity and value.

the cross-cut is completed and the deposit opened up by drifts north and south the actual gold content will not be determinable, but it is probable that there is now being developed an orebody that will produce a large quantity of gold. The surface sampling gave good results. The development so far has been satisfactory. The operators have reason to believe that they have the

makings of a big gold mine. My own opinion is that their confidence in the property is well justified.

At the West Tree property a rich deposit is being developed. A shaft is being sunk in this deposit near the shore of Upper Wasapika lake. In the shaft, the narrow but rich veins are being broken as the work progresses. Across the lake and a few hundred feet from this shaft is another shaft from which some rich ore was taken a few years ago. It is the intention of the West Tree company to drive across the lake toward this second shaft. In this way the deposit that strikes across the lake will be developed, and at the same time it is probable that another vein which is exposed near the south end of the lake and which strikes up the lake will be cut.

At the Herriek a well-defined vertical gold-quartz vein has been stripped and sampled and a shaft has been sunk on the vein to a depth of 50 ft. The surface showed good ore; likewise the vein in the shaft. The operators decided to test the deposit by numerous diamond-drill holes. The first hole has been started at a dip angle of 60° at a point 230 ft. west of the shaft. If the vein continues vertical it should be encountered at a depth of about 450 feet.

The good results being obtained at the Wasapika, West Tree, and Herriek will result in the development of many other properties in the vicinity. On the Atlas property camps have been constructed and some development work is being done. The Saville-McVittie, south-east of the West Tree, is still idle. The Churchill property, south of the Herriek, is receiving some attention and prospecting has been begun on the Wakenda properties, north of the Herriek. All these and several other properties in the neighborhood merit attention.

ALAMOSA CREEK valley, which is about 50 miles northwest of Magdalena, in northern Socorro county, New Mexico, includes several areas in which it is worth while to drill for oil and gas, according to a report just submitted by Dean E. Winchester for publication by the U. S. Geological Survey. Mr. Winchester describes anticlines in which the sandstones of the Miguel formation (Manaos shale) and the Dakota sandstone can be penetrated at depths not exceeding 2500 ft., considers the possibility of finding oil and gas in the region, and after making a study of the physical and chemical characteristics of the rocks, including the carbonaceous beds, concludes that the chances of getting oil are good and that if oil is found it will be of high grade and will probably be accompanied by gas. The rock beds in the region have been folded into well-defined anticlines and synclines, and in some places have been faulted, but the oil, if it ever existed in the formations, has probably not escaped. One of the most favorable places for testing the region for oil and gas is along the Cow Springs anticline, in Sec. 19 or 30, T. 4 N., R. 9 W., where fuel for the boilers of the drilling machines can be mined within sight of the rig. The chances of getting oil or gas in the formations below the Dakota sandstone are

not considered good, but these sands can be tested by a well drilled to a depth of 3000 ft. in Sec. 2, T. 3 N., R. 8 W., on the west side of the Red Lake anticline and fault.

Tungsten in Peru

Practically all the tungsten ore exported from Peru is produced in the districts of Conchucos and Corongo, both situated back of the ports of Salaverry and Chimbote, the mineral being transported over the mountains on the backs of llamas and burros from the tungsten mines to the railways connecting with these two ports. Practically all mining of tungsten is done in a very primitive manner. The miners are the Indians—what are commonly known in Peru as cholos—of the mountain districts. The mineral is all hand washed by the Indians. The mining of tungsten in Peru may be considered sporadic; that is, its development depends largely upon the demand and prevailing prices in Liverpool and New York. When the price of the ore is low, little interest is manifested in it, and the Indians are withdrawn from the tungsten mines or holes to be occupied in the copper and silver producing mines in the same district. Fortunately during the last four years there has been a good demand for tungsten, which has favorably affected the industry.

Prior to the war about 60% of all tungsten exported from Peru went to Germany. Since the middle of 1914 the exports have been diverted to the United States, a small quantity finding its way to Great Britain and France. During 1918, 246,562 kilos was exported from Peruvian ports to New York. The tungsten content was 151,313 kilos, and the value \$335,799.

It is difficult to ascertain the cost of the production of tungsten delivered at the coast, as it depends upon the distance the ore is transported by llamas and burros, the proximity of the mines to the railways, and the wages paid. The cost of mining and delivering the concentrates at the seacoast is probably small in comparison with the prices received during the War for the ore, particularly when it is known that the average Indian miner works for about \$1 per day. The price received for the ore is regulated by the prevailing price of the mineral markets of Liverpool and New York. Tungsten is shipped in concentrates of from 58 to 60%. The owners of the ore generally arrange with the buyers to draw against each shipment up to 70% of its value. The price of tungsten in June 1919 was about \$10 per unit of 60% concentrate. Before the War it was about \$7; during the War the price reached the maximum of \$26 per unit.

THE crude barytes produced and marketed in the United States in 1918 amounted to 155,241 short tons, one-fourth less than the quantity marketed in 1917, and one-third less than that marketed in 1916, according to statistics collected by the U. S. Geological Survey. The average price per ton was \$6.73, as against \$5.66 in 1917 and \$4.56 in 1916.

Mining on the Indian Reservations

Section 26 of the Act of June 30 (Public No. 3, 66th Congress) specifies as follows:

That the Secretary of the Interior be, and hereby is, authorized and empowered, under general regulations to be fixed by him and under such terms and conditions as he may prescribe, not inconsistent with the terms of this section, to lease to citizens of the United States or to any association of such persons or to any corporation organized under the laws of the United States or of any State or Territory thereof, any part of the unallotted lands within any Indian reservation within the States of Arizona, California, Idaho, Montana, Nevada, New Mexico, Oregon, Washington, or Wyoming, heretofore withdrawn from entry under the mining laws for the purpose of mining for deposits of gold, silver, copper, and other valuable metalliferous minerals, which leases shall be irrevocable, except as herein provided, but which may be declared null and void upon breach of any of their terms.

That after the passage and approval of this section, unallotted lands, or such portion thereof as the Secretary of the Interior shall determine, within Indian reservations heretofore withheld from disposition under the mining laws may be declared by the Secretary of the Interior to be subject to exploration for the discovery of deposits of gold, silver, copper, and other valuable metalliferous minerals by citizens of the United States, and after such declaration mining claims may be located by such citizens in the same manner as mining claims are located under the mining laws of the United States: *Provided*, That the locators of all such mining claims, or their heirs, successors, or assigns, shall have a preference right to apply to the Secretary of the Interior for a lease, under the terms and conditions of this section, within one year after the date of the location of any mining claim, and any such locator who shall fail to apply for a lease within one year from the date of location shall forfeit all rights to such mining claim: *Provided further*, That duplicate copies of the location notice shall be filed within sixty days with the superintendent in charge of the reservation on which the mining claim is located, and that application for a lease under this section may be filed with such superintendent for transmission through official channels to the Secretary of the Interior: *And provided further*, That lands containing springs, water holes, or other bodies of water needed or used by the Indians for watering live stock, irrigation, or water-power purposes shall not be designated by the Secretary of the Interior as subject to entry under this section.

That leases under this section shall be for a period of twenty years, with the preferential right in the lessee to renew the same for successive periods of ten years upon such reasonable terms and conditions as may be prescribed by the Secretary of the Interior, unless otherwise provided by law at the time of the expiration of

such periods: *Provided*, That the lessee, may in the discretion of the Secretary of the Interior, be permitted at any time to make written relinquishment of all rights under such a lease and upon acceptance thereof be thereby relieved of all future obligations under such lease.

That in addition to areas of mineral land to be included in leases under this section the Secretary of the Interior, in his discretion, may grant to the lessee the right to use, during the life of the lease, subject to the payment of an annual rental of not less than \$1 per acre, a tract of unoccupied land, not exceeding forty acres in area, for camp sites, milling, smelting, and refining works, and for other purposes connected with and necessary to the proper development and use of the deposits covered by the lease.

That the Secretary of the Interior, in his discretion, in making any lease under this section, may reserve to the United States the right to lease for a term not exceeding that of the mineral lease, the surface of the lands embraced within such lease under existing law or laws hereafter enacted, in so far as said surface is not necessary for use of the lessee in extracting and removing the deposits therein: *Provided*, That the said Secretary, during the life of the lease, is hereby authorized to issue such permits for easements herein provided to be reserved.

That any successor in interest or assignee of any lease granted under this section, whether by voluntary transfer, judicial sale, foreclosure sale, or otherwise, shall be subject to all the conditions of the lease under which such grants are held and also subject to all the provisions and conditions of this section to the same extent as though such successor or assign were the original lessee hereunder.

That any lease granted under this section may be forfeited and cancelled by appropriate proceedings in the United States district court for the district in which said property or some part thereof is situated whenever the lessee, after reasonable notice in writing, as prescribed in the lease, shall fail to comply with the terms of this section or with such conditions not inconsistent herewith as may be specifically recited in the lease.

That for the privilege of mining or extracting the mineral deposits in the ground covered by the lease the lessee shall pay to the United States, for the benefit of the Indians, a royalty which shall not be less than 5 per centum of the net value of the output of the minerals at the mine, due and payable at the end of each month succeeding that of the extraction of the minerals from the mine, and an annual rental, payable at the date of such lease and annually thereafter on the area covered by such lease, at the rate of not less than 25 cents per acre for the first calendar year thereafter; not less than 50 cents per acre for the second, third, fourth, and fifth years, respectively; and not less than \$1 per acre for each and every year thereafter during the continuance

of the lease, except that such rental for any year shall be credited against the royalties as they accrue for that year.

That in addition to the payment of the royalties and rentals as herein provided the lessee shall expend annually not less than \$100 in development work for each mining claim located or leased in the same manner as an annual expenditure for labor or improvements is required to be made under the mining laws of the United States: *Provided*, That the lessee shall also agree to pay all damages occasioned by reason of his mining operations to the land or allotment of any Indian or to the crops or improvements thereon: *And provided further*, That no timber shall be cut upon the reservation by the lessee except for mining purposes and then only after first obtaining a permit from the superintendent of the reservation and upon payment of the fair value thereof.

That the Secretary of the Interior is hereby authorized to examine the books and accounts of lessees, and to acquire them to submit statements, representations, or reports, including information as to cost of mining, all of which statements, representations, or reports so required shall be upon oath, unless otherwise specified, and in such form and upon such blanks as the Secretary of the Interior may require; and any person making any false statement, representation, or report under oath shall be subject to punishment as for perjury.

That all moneys received from royalties and rentals under the provisions of this section shall be deposited in the Treasury of the United States to the credit of the Indians belonging and having tribal rights on the reservation where the leased land is located, which moneys shall be at all times subject to appropriation by Congress for their benefit, unless otherwise provided by treaty or agreement ratified by Congress: *Provided*, That such moneys shall be subject to the laws authorizing the pro rata distribution of Indian tribal funds.

That the Secretary of the Interior is hereby authorized to perform any and all acts and to make such rules and regulations not inconsistent with this section as may be necessary and proper for the protection of the interests of the Indians and for the purpose of carrying the provisions of this section into full force and effect: *Provided*, That nothing in this section shall be construed or held to affect the right of the States or other local authority to exercise any rights which they may have to levy and collect taxes upon improvements, output of mines, or other rights, property, or assets of any lessee.

That mining locations, under the terms of this section, may be made on unallotted lands within Indian reservations by Indians who have heretofore or may hereafter be declared by the Secretary of the Interior to be competent to manage their own affairs; and the said Secretary is hereby authorized and empowered to lease such lands to such Indians in accordance with the provisions of this section: *Provided*, That the Secretary of the Interior be, and he is hereby, authorized to permit other Indians to make locations and obtain leases under the provisions of this section, under such rules and regula-

tions as he may prescribe in regard to the working, developing, disposition, and selling of the products, and the disposition of the proceeds thereof of any such mine by such Indians.

Production of Quicksilver

The output of quicksilver in the United States from April 1 to June 30, 1919, according to figures compiled by F. L. Ransome, of the U. S. Geological Survey, was 3940 flasks of 75 lb. net, a decrease of 2020 flasks, or of nearly 34%, as compared with the output in the first quarter. Only 16 mines were producing in the second quarter of the year as against 23 in the first quarter. Of the 3940 flasks produced, 2632 flasks is credited to California, 1244 to Texas, 34 to Nevada, and 30 to Oregon. The quicksilver on hand at the mines or in transit to market at the end of the second quarter amounted to 1635 flasks, which was 2784 flasks less than the quantity on hand or in transit at the end of the first quarter.

The average monthly prices of quicksilver in San Francisco during the second quarter of 1919, as quoted in the 'Mining and Scientific Press,' were: April, \$73.12; May, \$84.80; and June, \$94.40. The price thus made a progressive increase from \$72.80 in March, which was the lowest price since the beginning of the war. The downward trend of the price of quicksilver during the first quarter, the uncertainty as to the future, and the high cost of operation, together with the general scarcity of readily available ore, co-operated to diminish production at the beginning of the second quarter, and the mines have not yet responded at equal rate to the activity in the quicksilver market at the end of that quarter. A number of mines ceased operation early in the quarter, and it is not to be expected that these should immediately resume production at every appearance of improvement in the conditions that affect the mining of quicksilver.

With the cessation of hostilities between the principal belligerents in the great war some of the quicksilver producers were decidedly pessimistic as regards the future of the industry. They expected an immediate influx of foreign quicksilver and a fall in prices approximately to the level of those that prevailed early in 1914. The present conditions, however, appear to indicate that at least some of the producers were unduly apprehensive of immediate disaster.

THE PRICES OF CRUDE OIL have remained practically constant since the entrance of the United States into the world war, but the future is generally considered so promising commercially by the industry that every effort has been made toward finding new fields and bringing old fields to a high stage of development. Prospecting for oil is conducted almost entirely by the large companies upon geological advice. At the present time the chief centre of interest is the Paleozoic belt in Texas and the Cretaceous formations in Wyoming.

Technical Operations on the Suan Concession, Korea—II

By A. R. WEIGALL and J. F. MITCHELL-ROBERTS

PROSPECTING. With the successful development of the Suan mine, and a better realization of the general geologic conditions on the Concession, the possibility of other geologically similar orebodies around the edges of the granite intrusion arose, and prospecting operations on a small scale were started. At the commencement no definite plan was formulated and a foreigner with extensive local experience took charge of this work. A bonus was also offered to any Korean who discovered a profitable orebody, and a small sum of money was expended in paying independent native prospectors for work done.

In former times the Koreans had done a great deal of prospecting and shallow mining all over the country, and every large metal mine operated today in Korea is on the site of extensive ancient workings. Also in every case the Koreans were operating the mine with their primitive methods of mining and milling at the time the property was taken over by Japanese or foreign mining companies. The Tul Mi Chung mine on the Concession is probably the only exception in Korea of a profitable mine being developed at a place where Koreans were not actively engaged in working the ore at the time when a foreign company commenced mining operations, and even in the case of Tul Mi Chung there is evidence of extensive old workings, obviously of great age, as the signs of work had been almost obliterated and the site covered with vegetation. As compared with other old workings in Korea, comparatively little had been done at Tul Mi Chung by the natives, probably on account of the refractory nature of the ore and the difficulty of extracting the gold, and further because the copper content of the ore was too small to pay for its recovery by primitive methods. On the other hand, when modern operations were commenced at the Suan mine a great deal of Korean shallow mining had been done and was actively in progress. At the time the property was first examined, practically all ore in sight had been mined leaving only the shell of the deposit, a fact that made it difficult to form any reliable opinion as to the deeper extension of the orebodies and their average grade. As a general rule, the Koreans had followed the ore until their workings caved or until they reached water-level.

Although throughout Korea the native miners had mainly confined their work to the softer and richer bands of ore, which could be won without the aid of explosives, still the existence of old workings has been of the greatest possible assistance to prospecting operations and has led to the discovery of practically every mine worked today in Korea.

The Korean methods of mining and extracting gold and other metals, principally iron and copper, are of the

primitive type usual in Oriental and tropical countries. The mine-workings consist of small and irregular openings through which it is difficult to crawl. The ore was broken by moils and hammers, and carried to the surface in small sacks or baskets. Where the ore was hard it was cracked by fire-setting. On arrival at the surface, the ore was broken to small size and carefully hand-sorted, a process at which the Koreans exhibit remarkable skill. The sorted ore was then ground under rocking-stones operated by hand, or, in later times, in small iron-shod wooden stamp-mills driven by water-wheels. The finely ground ore was then panned for its gold content. The use of cylindrical revolving stones was adopted in order to accomplish additional grinding and to free the fine gold from the sulphide minerals, and allow it to be recovered by panning.

The first prospecting work done on the Concession was mainly directed to the search for old workings, which when found were cleaned out and opened up according to the evidence obtained. In this manner the discovery of the Tul Mi Chung mine was made.

It was soon seen that haphazard methods of prospecting were inadequate. It was early recognized that the surficial impoverishment, which was such a marked feature of the orebodies then known, might easily cause a large orebody to be overlooked; moreover, the old Korean miners had searched for the small high-grade deposits, so that a large low-grade orebody, which might not have been of value to the natives, might easily prove profitable when exploited by modern methods.

As a first step a reliable geological and topographical map of the whole Contact was made by D. F. Higgins, and this map and the lengthy report that accompanied it allowed the prospecting work to be planned in a systematic manner. In this report Mr. Higgins laid down the following criteria for the guidance of further prospecting on the Concession:

“1. Leached, oxidized, rusty-looking, and copper-stained outcrops. This criterion is, of course, a general one for all districts.

2. Placers at or below the Contact.

3. Old Korean workings.

4. Contact-minerals; such as tourmaline, diopside, and garnet.

5. Evidence on the surface of faulted or sheared zones in the rock just outside the Contact.

6. Limestone contacts are more likely places than schist contacts with the granite.

7. Especial activity of magmatic waters, as shown by the degree of intensity with which the metamorphic minerals are localized.

8. Evidences of differentiation in the magma as shown

by the presence at the contact against the granite of small bodies of igneous rock related to the granite.

These criteria are only intended to apply to deposits along the Contact. Especial attention is called to the importance of the fifth and eighth ones. The last is the feature that separates Holkol[®] (Suan) and Tul Mi Chung from all the other present openings. Very careful search should be made along the Contact for contact rocks similar to the Holkol granite and the Tul Mi Chung quartz-porphry, and the Tul Mi Chung tourmaline-granite, and, if found, their vicinity should be very carefully examined for evidences of mineralization."

Shortly following the completion of this geological report an experienced mining engineer was engaged to take charge of the prospecting and provided with a staff of foreign assistants. The work was first based on the general geologic information available, the main feature of which is the central boss, or batholith, of granite whose circumference, or contact with the surrounding sedimentary rocks, is the locus of most of the ore on the Concession. The granite intrusion, while not greatly altering the general dip of these sedimentaries, has faulted them considerably so that although the general dip and strike is more or less the same all round the boss, the fault-lines radiate and cross in all directions. These faults have served as the channels by which ore has been led to its present situation. A number of intrusive basic dikes occur but have no relation to the distribution of the ore; they consist of various types of basalt, dolerite, etc. The aplite acid dikes, on the other hand, appear to have been extruded at about the period of ore deposition and are consequently frequently associated with the occurrence of ore and almost universally contain a trace of gold in themselves, even thousands of feet away from the main contact.

From experience it has been found that for ore deposition here the following main features are essential, namely, (1) a suitable material for replacement, (2) an impervious hanging wall, such as schist, granite, or intrusive dike, and (3) faulting connected with the main granitic intrusion for the passage of the hot mineralizing solutions that have been the source of the ore.

The centre of the Concession is the granite boss, which rises to a height of 4000 ft. above the sea-level. From the granite the streams radiate like the spokes of a wheel. The boss is approximately 23 miles in circumference and where it meets the limestone is mostly about 1000 ft. above sea-level, whereas the junction of the granite and the schist ridges runs up to 3000 ft. above sea-level. The streams leading away from the centre of the granite area and crossing the Contact have acted as sluices, and, in this way, have in places formed small gold-placer deposits, most of which have been worked by Koreans. Such placers have been an important guide in prospecting, as indicating the occurrence of ore in the watershed drained by any given stream.

In preparing the prospecting program the whole area around the Contact was mapped into blocks of approximately a mile square, such maps being enlargements of the geologic map of the Contact, and drawn to a scale of

150 ft. to the inch. On these enlarged plans all the known data were plotted and all additional information obtained was added monthly. Each block then received a preliminary prospecting by a foreign prospector with Korean partners. Holes were sunk to bedrock about 300 ft. apart up all creeks and valleys and a full record plotted on the block-maps showing depth of hole, nature of bottom, and whether panning yielded any gold or other ore-mineral, garnet-sand, etc. If any such minerals were found, intermediate holes were then put down 100 ft. apart. When any mineral had been found or any promising indication of ore, a close inspection of the surface and a study of the geology of the block under examination was made; a larger area was marked out of such extent that it could be covered by a man in a day, and this area placed under the charge of a foreign prospector and his Korean assistants. This area was then subjected to an intensive prospecting and panning campaign, the original prospectors being moved to the next block, and so on.

The second stage comprised not only the panning of the creeks and valleys, but also the panning of the hill-sides as well, until the minerals discovered had been traced to their source. This was done by placing holes about 100 ft. apart, and if the top one showed no gold or ore mineral, then holes were sunk half-way to the last one that showed gold, and so on until the approximate line of mineralization had been ascertained. A series of trenches was then sunk across the line of mineralization and if indications of sufficient promise were obtained, underground work was started.

All holes sunk were panned in two-foot deep sections and the last half-ounce in the pan was in each case retained and put into one 'creek' sample. Composite 'creek' samples were made up into 'district' samples, and a complete analysis made of them to ascertain the minerals present. Such analyses were supplemented from time to time by special analyses made abroad by firms who specialize in the analysis of rare minerals. Microscopic examinations were also constantly made at the mine. By this means it was soon found out that, for instance, tungsten in small amounts was widely distributed around the Contact.

The underground prospecting work consisted of carefully following the irregular mineralization in all of its twists and turns, because, owing to the erratic occurrence of the orebodies, anything like straight and regular drifts or winzes was out of the question. In all such work especial attention was paid to the faults recorded on the plans. The district prospectors were afforded every opportunity of going over the stopes and development work in the producing mines in order to familiarize themselves with the nature of the ore-occurrences and as a rule were employed for a time in the mining operations before being engaged in prospecting work.

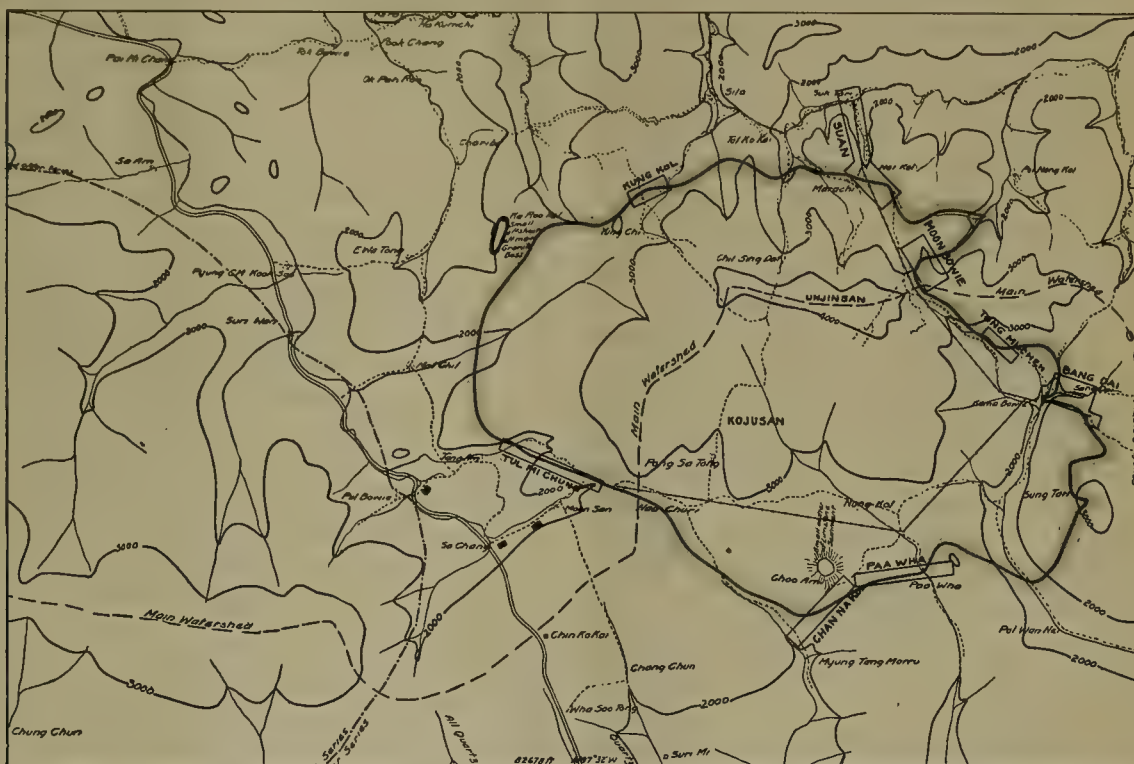

The average area covered by one foreigner in an intensive panning campaign was about four square miles and it usually took him about six months to prospect such an area at a total cost of about \$2000. The average cost of prospect-panning holes has worked out at about

five cents per foot sunk. The cost of trenching has varied greatly, but has averaged about seven cents per cubic yard excavated.

This prospecting campaign has resulted in the discovery of profitable ore at several localities around the Contact, to say nothing of the dozens of previously unknown outcrops that finally proved valueless but would nevertheless have formerly been missed under the old methods of prospecting. A similar plan of prospecting would, no doubt, be found suitable for the investigation of mineral possibilities in other regions, particularly in

pected size, or the reverse. The difficulty is to avoid excessive under-estimation on the one hand and too optimistic over-estimation on the other, as, of course, is the case in all estimates; but in this particular instance the difficulty of making the correct allowance and deductions is unusually great, and it requires considerable local experience and a good knowledge of the general geologic conditions in order to arrive at a correct appraisal of the ore-reserves developed at any time.

All sampling, surveying, and ore estimation on the Concession is carried out by one department, called the

MAP OF THE CONCESSION, SHOWING HOW THE WHOLE CONTACT (MARKED BY THE SHADED LINE) WAS INCLUDED

After D. F. Higgins

the case of deposits of this type where the outcrops are not prominent.

ESTIMATION OF ORE. The determination of the average grade of the ore in deposits of this type presents more than the usual difficulty. Not only are the orebodies exceedingly irregular both in size and shape, but also the ore itself shows great variation in its metal contents. Spotty assays are more the rule than the exception. Another feature that adds to the difficulty, as compared with the estimation of ore-reserves in ore deposits of a more regular type, is that the rectangular blocking out of ore by drifts and winzes is not practicable. The orebodies contain unsuspected 'horses' and sheets of barren limestone, which call for caution in allowing for the extension of ore; and attempts to allow for this are often made only to find that an orebody has, suddenly and without any apparent reason, increased to twice its

Ore Estimation and Surveying Department. The mine-plans are divided up into blocks of 100 ft. square, numbered from east to west and marked alphabetically from north to south. All workings are referred to a block number and a letter, for instance, "Block 20-R, Winze on No. 1 Level", and all mining or assay plans show this block system. The general mine-plans are on a scale of 50 ft. to the inch. Mine models are also used for the chief workings.

The underground workings in the mines and prospects are sampled at five-foot intervals, whether they are in ore or not, the results being recorded on assay-plans drawn on a scale of 20 ft. to the inch. These assay-plans are on sheets of standard size, each 40 by 25 inches, for convenience in handling. Cross-cuts and winzes in ore, as shown by the preliminary sampling-records of the assay-plans, are re-sampled on both sides of the workings.

Stopes are sampled twice every month. When the boundary of any stope is reached in mining, a series of long holes is put into the walls and the drillings assayed to make certain that the true limits of the orebodies have been reached.

The prospects on the Concession are sampled as the workings progress by the foreign prospector, and all workings in ore are re-sampled by the Ore Estimation Department. Mining and assay plans and the mine models are brought up to date monthly. Besides the actual assays, the main geologic features and faults are recorded.

The average deductions made from the actual assay-averages vary with the different blocks of ore, but as a rule 15% of the gold content and 10% of the copper content as shown by assay are deducted to arrive at the true average grade of the ore. In certain stopes, where the gold content is relatively low and the copper content high, 10% of the gold value and from 15 to 25% of the copper value, as shown by the assay-records, is deducted to arrive at the estimated grade of the ore in a block. No fixed rule is adopted and the question of the percentage deducted in every case from the assay-averages is largely governed by the degree of 'spottiness' or irregularity of the assays for the orebody in question.

Very high, or 'freak,' assays, especially in the case of rich ore surrounded by poor ore, are disregarded in computing averages. Rich spots are re-sampled, and if the re-sampling checks the original high assay, an average of the surrounding assays is made and this average result substituted for the eccentric result. Here again the number of surrounding assays that are included to arrive at the average figure to be substituted depends on the irregularity of the surrounding results.

Grab-samples from each car of ore sent to the mill are taken at the chutes and the actual average grade as ascertained by milling furnishes a pro-rata correction for that month, serving as a rough check for the grade of the ore mined from each block during the month. A sheet is prepared monthly showing the value of each block stoped during that period according to the grade specified in the ore-estimate. The total metal in the ore as called for by this estimate is then compared with the actual metal in the ore as furnished by the mill-results and a correcting factor obtained, from which any adjustment of grade in the ore-reserve estimates is made. This practice, if carried out over long periods, allows of close approximation being obtained. During the past year the actual grade of the ore milled has shown a remarkably close agreement with the estimated grade of the ore mined.

A monthly report, together with full plans, is prepared by the Department. This shows the total tonnage of the ore-reserve as brought up to date and into adjustment with the latest information covering tonnage, and its average grade as given by the last stope-plans and the milling results. In this manner the actual tonnage available not only on the whole concession, but also in each block of ore in the various mines and prospects, forms part of the monthly mining reports and allows the whole

underground situation at any time to be seen at a glance. The system employed is doubtless more elaborate than the general practice, but is made necessary on this concession by the unusual irregularity of the ore-occurrences. It required some time and care to standardize the results in calculating the ore-estimates, but we have now arrived at a stage where complete reliance is placed on the monthly reports of the ore-reserve.

The Ore Estimation and Surveying Department consists of two foreigners, one Korean assistant-surveyor, three Korean draftsmen, one Korean survey-assistant, and one coolie, as well as two sampling-crews each consisting of three Koreans. The average total monthly cost of the department amounted in 1918 to \$755.

MINING. The first work done on the Concession was done at what is now the Suan mine. The mine had already been worked to varying depths, averaging 50 to 75 ft. below the outcrop, by Koreans; but most of these old workings had caved and were inaccessible. Practically no ore was in sight.

The first underground work consisted of driving three cross-cuts with the object of cutting the continuation of the ore below the old Korean workings. This work did not succeed in its object because the old workings extended to greater depth than was supposed. Also, as it happened, where these cross-cuts did cut the ore-channel it proved to be small in size and low in grade. Accordingly, it was decided to sink from the cross-cut level and cut the formation at greater depth. A vertical winze was sunk to a depth of 120 ft. and at this level a considerable amount of driving and cross-cutting was done. Owing to an error in deciding what was the true dip of the deposit, and also on account of the bulk of this development work being done on what afterward proved to be a small and comparatively worthless stringer outside the main orebody, it was decided, after about two years of somewhat disappointing work, that the deposit did not present sufficient promise to warrant further expenditure, and the mine was shut-down.

At this time the property was jointly owned by the Korean Syndicate, a British firm, and Collbran & Bostwick, an American firm carrying on business in Korea, and the whole of the mining work done was performed under the direction of the engineers of the first-named corporation. When the decision to shut-down the mine was reached by the Korean Syndicate, Messrs. Collbran and Bostwick were in favor of more exploratory work before the property was abandoned, and an arrangement was made by which the American firm took over the property and recommenced work, the British firm accepting in return for its half-interest a share of any profit that might be won and relief from any further expenditure. Directly following this arrangement, Messrs. Collbran and Bostwick secured pumping machinery, and, after unwatering the workings, continued the development of the mine. The first work done was to drive cross-cuts from the bottom of the former workings. Almost immediately the pluck and persistence shown by this

firm was rewarded by the discovery of a large body of high-grade ore. Following this promising discovery, the Seoul Mining Company was formed on April 27, 1908, to take over the rights owned by Collbran and Bostwick, and by the sale of shares sufficient money was raised to carry on the development of the mine. The orebody was further proved by drifts and winzes until, in 1909, it was decided to erect a stamp-milling plant.

In order to operate the mine more conveniently, an adit was driven to connect the deepest workings with the surface and an inclined three-compartment shaft sunk from the adit-level on the dip of the ore. Levels were opened up at vertical intervals of 100 ft. below the adit, the shafts being eventually continued to No. 5 level, 500 ft. vertically below the adit. The ore, however, cut out shortly above No. 4 level, or about 650 ft. vertically below the outcrop, and the fifth level was abandoned. All ore mined was trammed to the shaft and from there brought to surface through the adit.

The incline-shaft is of three compartments, 16 ft. 10 in. by 7 ft. 4 in. clear, the inside measurements of each compartment being 6 ft. by 4 ft. 6 in. The sets of timber are of native oak, 8 by 8 inches, spaced at 5-ft. centres. The shaft is sunk at an inclination of 70°. Down to a vertical depth of 330 ft. below the adit, it was sunk in limestone; below it is in hard solid granite. It was sunk entirely by hand-drilling, an average progress of one foot per day being made. Not much water was encountered in sinking and the cost of baling this water was unimportant. It will be of interest to record the cost of sinking this shaft the last 100 ft. of its depth. The following figures do not include foreign supervision. The contract price paid per foot of sinking from No. 4 to No. 5 level was \$12.50. This was the highest price paid for sinking, the rate having increased with depth and with the increased hardness of the rock. The whole shaft averaged from \$10.50 to \$11 per foot sunk, but accurate figures are not available, as the contract rate was altered from time to time to meet the varying hardness of the rock. The contract-price comprises all labor and supplies used, and includes explosives, steel, candles, tools, etc., besides the delivery of all excavated material on the level above and the placing of the timbering.

Cost of Incline-Shaft at Suan Mine per 100 Feet Sunk

| | Total cost |
|--|------------|
| Mining: contract for sinking @ \$12.50 per foot..... | \$1,250.00 |
| Timber (per set): | |
| Two wall-plates 33 ft., two second plates 16 ft., total 49 ft. of 8 by 8 lumber @ 7½c..... | \$3.67 |
| Two dividers 12 ft. 6 in. of 6 by 6 lumber @ 6½c.... | 0.81 |
| Eight posts 5 ft. 6 in., 36 ft. of 6 by 6 lumber @ 6½c. 2.34 | |
| Carpenters and labor | 1.00 |
| 20 sets at per set..... | \$7.82 |
| Oak lagging, 8 in. by 1½ in. by 5 ft., 60 pieces per set @ 7½c..... | 4.50 |
| Lagging, 20 sets at \$4.50..... | 90.00 |
| Back runners, 400 ft. of 4 by 4 @ 4c. per foot..... | 16.00 |
| Ladders, 100 ft. @ 5c. per foot..... | 5.00 |
| Incidentals | 200.00 |
| Rails: 200 ft. of track at 50c. (purchased second-hand)... | 100.00 |
| Total cost per 100 ft..... | \$1,817.40 |
| Or, per foot of shaft sunk..... | 18.18 |

Foreign supervision and incidentals brought the final cost up to \$20 per foot.

The shaft has two hoisting-compartments and a third

compartment for a ladder-way and for the air and pump mains. The pockets on each level have a capacity of about 150 tons of ore. Hoisting is done in 1½-ton skips, which dump into an underground bin cut in the limestone at the head of the shaft, whence it is drawn and trammed to the sorting-house on the surface. The adit is driven at an inclination of slightly less than 1%.

When stoping operations were started in the Suan mine, the large size of some of the orebodies, which, in places, called for stopes nearly 100 ft. wide, made it appear that square-set timbering would have to be employed, and in the beginning this method was adopted to a limited extent. The scarcity and high cost of suitable timber and the difficulty of obtaining an adequate supply of straight sticks of sufficient diameter, and the bad transport conditions then existing, making it impossible to bring in a supply of timber from more distant sources, soon made it apparent that some other system of stoping would have to be adopted.

The walls of the orebodies in this mine were found to consist of a hard and durable limestone, which formed exceptionally good standing ground. The dip of the ore-shoots was fairly steep, averaging from 70° to 80°. The ore itself, although comparatively soft in places, was generally hard and firm, and stood well without supports. These conditions resulted in the decision to mine the ore by shrinkage-stoping. The bulk of the ore mined in the Suan has been won by this method.

As the workings progressed it was found that bulges and irregularities occurred in the walls and also unsuspected 'horses' or 'floaters' of limestone were present in the orebodies. However, we adhered to the shrinkage system until the final stages of mining operations, when it was found not only necessary, but more economical, to fill the stopes closely with waste and carry the ore-passes through the filling.

With the further development of the mine it was found that the two main orebodies were separated by a rib of limestone, which proved to be wedge-shaped and tapered out in depth. The strength of the walls was over-estimated and not enough filling was run into the empty stopes, with the result that, as the mine workings reached the final stages, some serious caving occurred and the winning of the remaining ore in the mine was attended with increased cost. The recovery of the unsupported arches, many of which were found to be caved, was only accomplished with a great deal of risk and difficulty, although happily without accident.

In the light of the information now available it would have proved more economical to have worked the mine by keeping the stopes closely filled with waste, carrying ore-passes through the filling, as was done in the final stoping operations at Suan and has also been adopted in the Tul Mi Chung mine where conditions admit of it. This system involves more handling of the ore in the stopes than in shrinkage-stoping, but with the cheapness of Korean labor this is not so serious an item as was at first supposed. One great advantage in favor of shrinkage-stoping is that it permits the accumulation of a

large tonnage of broken ore in the stopes and allows of a more constant supply of ore to the mill than is possible from stopes that are kept filled with waste to the level at which ore is being stoped. One great disadvantage of shrinkage-stoping in the mines on the Suan Concession, and probably in other limestone-replacement deposits, is that ore frequently runs off into the walls, especially the foot-wall, in tongues and stringers that sometimes lead to extensive additions of ore, with but little evidence of this showing on the wall of the stope. In shrinkage-stopings these signs are liable to be overlooked. Where stopes are kept filled with waste there is much better opportunity of following such stringers and prospecting the walls, and it has been found that this practice has in several instances led to the discovery of unsuspected extensions of the irregular orebodies that possibly would have been missed in a shrinkage-stope. The waste from the prospecting of the walls and the 'floaters' of barren limestone can be used as filling, whereas this material had to be mixed with the ore in shrinkage-stopings and was only partly eliminated by subsequent hand-sorting on the surface, the grade of the mill-ore suffering in consequence.

In opening up a stope for shrinkage-stoping, a sill-floor is first of all cut on the level to the full horizontal area of the orebody. Over this sill an arch about 10 ft. thick is left, through which the ore-chutes are carried. These chutes are usually 25 ft. apart. The ore is mined as a flat-back stope over the whole width, broken ore being drawn off to preserve sufficient room to allow the miners to continue working on the back. As the stope approaches the overlying level, an arch, about 10 ft. thick, is left to maintain the safety of the workings. The final winning of these arches was costly and dangerous owing to the caving, and it would probably have proved more economical in the long run to have completely excavated the blocks of ore in the first instance and filled the stopes, except on the adit, where, by leaving the level intact, surface seepage through the old Korean diggings was tapped and prevented from flowing into the lower workings. During the stoping, access was obtained through winzes from the level above, and these served later as passes for dumping waste into the empty stope.

The operation of the Suan mine did not involve features that call for special mention; it followed general practice. The main levels are 100 ft. apart. Drifts and cross-cuts are driven about 7 ft. high by 5 ft. wide. Ore-chutes are generally about 25 ft. apart, and, owing to the size and irregularity of the stopes, it was frequently necessary to use stope-drifts and raises for chutes. In sinking winzes, buckets and hand-worked windlasses were first adopted, and, later, Holman stretcher-bar hoists. The tracks in the Suan mine have a gauge of 18 inches and in the Tul Mi Chung 24 inches.

The Suan is now approaching exhaustion after having produced to the end of 1918, 588,199 tons of ore for a total yield of \$5,609,524, equivalent to a yield of \$9.54 per ton of ore mined. The Tul Mi Chung is now the main producing mine on the Concession, milling opera-

tions having commenced in October 1915. From that date the mine has been in continuous operation, and produced, to the end of 1918, 437,778 tons of ore for a total yield of \$3,107,740, or at the average rate of \$7.10 per ton of ore.

The orebodies in the Tul Mi Chung, and also in the adjoining Tong Ahm mine, which has recently commenced steady production, are much more widely scattered than those of the Suan; they are also more irregular in their occurrence and usually have weaker walls, and generally present greater difficulties in mining. One main point of difference, which has an important bearing on the cost of mining, is that while the dip of the Suan orebodies was as a rule fairly regular and steep, averaging about 70°, the Tul Mi Chung orebodies usually dip at a much flatter angle and in many cases ore and waste will not flow in the stopes, necessitating much shoveling. While some of the orebodies occur wholly in limestone, as at Suan, about one-half the ore mined to date is found at the flatly-dipping (about 30°) boundary of limestone with overlying schist. This schist usually forms bad standing ground, and in such cases the stopes have to be closely timbered and kept filled. Square-set timbering is adopted in about one-half the stopes in the mine and the other half is mined without timber supports. The square sets consist of round legs of fir, of 10 in. diameter for posts and 12 in. for caps. This timber is obtained from the forests on the upper reaches of the Yalu river, which forms the frontier between Korea and Manchuria. The timber comes in straight lengths, but is lacking both in strength and durability, and the average life of such a stick in the mine is only three years, after which it deteriorates rapidly.

The square-set stopes are started from sills on the floor of the level and carried right through to the level above. The stopes are closely filled, the timbering kept as close as possible to the back. Formerly the practice was to keep the square-set stopes filled with broken ore and when a stope was worked out to the level above, it was drawn from one end and filling run in as the ore was drawn off in advance of it. This method had to be abandoned because the timbers would not stand unsupported, and the practice now is to keep the square-set stopes completely filled up with waste all the time, leaving only one row of sets at the back of the stope open. The stope starts from a raise at one end and advances the whole width of the stope; and as the ore is passed down, the sets are kept filled behind with waste.

The schist makes a heavy hanging wall and if not well supported is liable to come away in large blocks. In such cases, where the walls were regular enough and the dip sufficiently steep to allow of it, shrinkage-stoping was adopted, but this system has now been replaced by filling the stopes with waste and establishing ore-passes. One important reason for this change is to allow of thoroughly prospecting the walls for extensions of the ore as the stope progresses upward and to make certain that 'false' walls are not mistaken for the true walls of the orebody. The foot-wall of the Tul Mi Chung lode

is quite irregular and ore in places follows slips into the wall. Not only this, but some of the orebodies contain sheets of barren limestone as well as the more common 'floaters', the disposal of which presents difficulty in shrinkage-stoping. In flat orebodies a method of stoping somewhat resembling the long-wall system of coal mining is adopted. Wheelbarrows are largely used for moving waste and ore in the stopes. In filling flat stopes, a great deal of dry-walling is used, Koreans being adepts at this work.

The Tul Mi Chung mine is opened up by means of a main adit, as at the Suan, and the bulk of the ore mined has been won from above the adit. Below the adit the workings have been extended by means of drifts and winzes to a vertical depth of 500 ft. No main shaft has been sunk in this mine yet, but one is now planned. The orebodies are so erratic and spread over such a wide area that the location of a shaft, or shafts, is a matter of difficulty. So far, the extension of the orebodies horizontally has been greater than the extension in depth and consequently the stopes are spread over a considerably larger area than is usual in mining, necessitating a heavier expenditure in equipment, such as track, air-mains, etc., and the distances that ore and waste have to be trammed underground is excessive. The distance from the south end of the Tul Mi Chung to the north end of the Tong Ahm, which is an extension of Tul Mi Chung, is approximately 4400 ft., and from east to west the Tul Mi Chung workings extend irregularly over a distance of approximately 2000 feet.

From the foregoing it will be seen that the two main features in operating this mine lie in the selection of the most economical method of stoping the ore, varying this method to suit the irregularity of the orebodies, and the question of underground development, which is really underground prospecting. The mine is a network of faults and slips, any one of which might lead to an orebody. It is out of the question to follow up all these, and considerable local experience is required to determine which ones present sufficient promise to warrant the cost of exploring them. About 2000 ft. per month of underground development work is done at the Tul Mi Chung and Tong Ahm mines. Perhaps the outstanding characteristic in the underground development of irregular orebodies of this type is the large amount of cross-cutting required to explore the ore-channels, the cost of which forms about one-third the total cost of mining.

The amount of pumping required is small, except in the rainy season, when a good deal of surface water finds its way into the mine. Speaking generally, the mines are not excessively wet.

Owing to the large area over which the workings extend, a great deal of underground tramming is necessitated, but the cost of it is exceptionally low. At the Tul Mi Chung all the track is laid with a 2-ft. gauge. Cars are of the U type, and of one-ton and two-ton capacity. The following figures will afford an illustration of the average cost of tramming by contract. At the Suan mine the ore is loaded into trucks at the shaft-

bin and trammed to the sorting-shed on the surface, a distance of 1980 ft. The cars hold 1500 lb. of ore and require one trammer apiece. The bearings on all cars are of the ordinary plain type. Gauge of track, 18 inches. A single track is laid for the whole distance. The sorted ore is dropped into an underground bin from which it is loaded in cars that hold 2000 lb. of ore, and trammed a distance of 2766 ft. to a second underground bin. For this distance cars are run coupled three together with one or two trammers in charge of the brake. The empties are returned by mules. It requires two men to tip the cars. From the second underground bin, the ore is loaded into cars that hold 4000 lb. and trammed 1600 ft. to the mill. Two trammers are required for each car to brake, tip the cars, and return the empties. The total distance is 6346 ft. and the cars have to be loaded and dumped three times. The contract price is $7\frac{1}{2}$ cents per ton of ore trammed.

At the Soctarie mine the ore is trammed over a single 18-in. track, level for the greater distance, 7238 ft. from mine to mill. Cars are loaded and dumped three times. The cars hold 4000 lb. and are drawn by mules. The contract price is $7\frac{1}{2}$ cents per ton of ore trammed.

At the Tul Mi Chung the ore is trammed by hand from the mine-chutes for an average length of 2000 ft. to the adit-portal. Each car holds 4000 lb. of ore and is provided with roller bearings. The gauge of the track is 2 ft., and 25-lb. rails are laid. From the adit-portal to the mill-bins the cars are hauled by mules over a double-track level road a distance of 3300 ft. The total average distance trammed is a mile, and the contract price, which includes loading and tipping cars, is $4\frac{1}{2}$ cents per ton of ore.

Practically all stoping is done by machine-drills and development by hand-drilling. In stoping, Ingersoll-Rand Butterfly stopers and Jackhamer drills are almost universally used. Koreans make excellent drill-men. In the small amount of development done by machine-drills, Siskol piston-drills and Jackhamers are used. The bulk of the work is done in rather hard limestone. The average rate of progress in drifts and winzes is as follows:

Monthly Rate of Progress of Developments

| | —By machine-drills— | | —By hand-drilling— | |
|--------------|---------------------|--------------|--------------------|--------------|
| | Ft. | Average, ft. | Ft. | Average, ft. |
| Drifts | 50 to 120 | 70 | 15 to 50 | 30 |
| Winzes | 30 to 60 | 40 | 15 to 35 | 25 |
| Raises | 40 to 90 | 60 | 20 to 40 | 30 |

A great deal of mining work, especially development, is done on contract. The average rates are given hereunder. These rates include all labor, explosives, candles, steel, tools, except machine-drills, where such are used, the tramming of all ore and waste to the nearest chutes or to surface, the hoisting of material in winzes, and, where necessary, the placing of timber supports. The company provides any timber necessary, and does all the drill-sharpening. The Korean contractor works as his own shift-boss and engages and pays his crew. The development work is carried out in ground that varies from hard massive granite, very hard garnet contact-rock, and rather hard limestone, the last predominating.

| | Per foot | Average |
|-----------------------------|------------------|---------|
| Drifts and cross-cuts | \$2.50 to \$4.50 | \$4 |
| Winzes | 4.00 to 6.00 | 5 |
| Raises | 2.25 to 4.00 | 3 |

The average total cost per foot driven or sunk, including all costs, for 15,782 ft. of development work done in the Tul Mi Chung mine during 1918 was \$4.07.

The cost and amount of labor that was used at the Tul

Mi Chung during 1918 for stoping on day's pay, stoping on contract, obtaining and tramping waste-filling from surface to stopes, and for development work, is shown by the following tabulation, which forms a good average of the amount and cost of labor used in the stoping, development, and stope-filling on this mine. The tabulations cover labor only and do not include any supplies. Practically all stoping is done with machine-drills and all development work by hand-drilling.

It should be noted that the above costs, and other cost figures given, refer to 1918, during which year the property was operated under adverse and abnormal conditions owing to the War. The total operating cost for the year, during which 201,151 tons of ore was milled, amounted to \$4 per ton as compared with \$3.46 in 1917.

The air-compressing plant at the Suan mine consists of a steam-driven Ingersoll-Rand type XI compressor of a capacity of 570 cu. ft. of free air per minute, and an Ingersoll-Rand Imperial type XB2 electrically driven compressor of a capacity of 1200 cu. ft. of air per minute. Only the latter machine is in use at present. At Tul Mi Chung there are two similar electrically driven compressors in operation. The main air-lines are of 8-in. diameter with branches of 4-in. diameter and from these pipe-lines 3, 2, 1½, and 1 inch are led to the working-faces. Well-fitted blacksmith-shops and machine-shops are provided. Drills are sharpened by Leyner machines. Owing to the distance from manufacturing centres a good deal of the mine equipment is made at the mine. The pumping equipment at Tul Mi Chung consists of one No. 9-B Cameron sinking-pump and three 4 by 6 by 4 in. Worthington duplex pumps at the sumps. As stated before, the mine is not a wet one and these pumps are in operation for an average of five hours per day, except in the wet season, when it is necessary to keep them in operation for 12 hours per day. All pumps are driven by compressed air. The explosive used is gelignite. All loading and firing of holes is done by Koreans.

(To be continued)

BACTERIA evidently not only aid in the decomposition of rocks and in the formation of beds of chalk and limestone, as has recently been demonstrated, but are active agents in the deposition of some beds of iron ore. Engineers have learned that iron-depositing bacteria may be troublesome pests through their ability to clog the pipes of city water-supply systems with hard thick crusts and slimy rusty masses composed of millions of individual bacteria. E. C. Harder, of the U. S. Geological Survey, who has examined deposits of iron ore in many countries for the special purpose of determining their mode of origin, has recently made close studies of the action of bacteria in forming iron ores. He has found the so-called iron bacteria actively engaged in the deposition of compounds of iron not only in surface iron-bearing waters but in mine waters to depths of several hundred feet and has made laboratory cultures of various iron-depositing bacteria. The results of these studies have just been published by the Survey as a paper entitled 'Iron-depositing bacteria and their geologic relations.' (Prof. Paper 113).

REVIEW OF MINING

CALIFORNIA

SIERRA COUNTY, GRASS VALLEY, NEVADA CITY.

SIERRA COUNTY.—Visible gold and sulphides have been found in a cross-cut in the Oro mine at Downieville. While driving a tunnel the past few months small bunches of rich ore have been found and it is believed from this showing that this is another feeder leading to the main vein some distance farther east. The Oro is being developed by Dr. Reynolds and others of Alameda. Work of the City of Six, in Chug canyon, has ceased for the season. The tunnel was advanced 150 ft. this summer. Raises and winzes along the serpentine foot-wall every 75 ft. have exposed a vein 3 ft. wide of ribbon-quartz panning free gold and arsenical sulphides of an estimated value of \$15 per ton. A tunnel lower down is in 1150 ft. The end of the tunnel is 350 ft. below the surface. By a recent decision in the U. S. Circuit Court of Appeals at San Francisco the Sixteen-to-One Mining Co. has been awarded \$93,000 from the Twenty-One Mining Co. at Alleghany on the ground of trespass by the latter. The litigation extended over several years.

GRASS VALLEY.—The first unit of the restraining dam at Bullard's Bar on the Yuba has been completed. Electrical machinery is still arriving at the Idaho-Maryland. The Pacific Gas & Electric Co. has petitioned the Railroad Commission to compel the North Star Mines Co. and the Empire Mines Investment Co. to make a change from water to electric power. Both these companies have operated for years on water-power and erected plants costing thousands of dollars, all of which would be worthless should the proposed change be carried out.

NEVADA CITY.—A merger of the Banner, North Banner, and Central claims near Nevada City has been effected under the name of the Central Consolidated Mines Co. and a permit granted to sell 300,000 shares of stock. The mines were formerly producers, but have lain idle for many years. W. J. Webster, of the Atlas Power Co., is president of the new company.

COLORADO

CRIPPLE CREEK, TELLURIDE, PARADOX VALLEY.

CRIPPLE CREEK.—Directors of the Portland Gold Mining Co. have declared the regular quarterly dividend of 2 cents per share, payable on October 20 to stockholders of record October 11. The amount, \$60,000, will bring the total sum paid to stockholders up to \$11,499,080. The Portland dividend, together with the dividends of \$45,000 of the Golden Cycle company and \$15,000 of the Vindicator Consolidated, mentioned in our last issue,

will bring the total of October distributions to \$120,000.

A vein in place, with promise of permanency, has been opened on Carbonate hill, north of the city of Cripple Creek and but a short distance beyond its northern boundary, by John L. Macdonald, an old-time prospector who has persistently prospected this region for about a quarter of a century with but small profit. While prospecting east of the Laura Lee on Mineral hill, and the Elkhorn on Carbonate hill—both small producers of high-grade ore, but now inactive—Macdonald uncovered at surface, under a large boulder of float, a quartz vein more than three feet wide, showing rusty gold. Samples have assayed 15 oz. gold per ton. The boulder of quartz, which weighed about half a ton, was broken and found to be liberally peppered with both rusty gold and sylvanite.

The shortage of miners has been accentuated by nearly two score men leaving last week for the Caribou district, where a higher scale of wages obtains. More than twenty men were induced to leave the Portland mine alone, and it is expected that the October production will be curtailed accordingly.

TELLURIDE.—Anticipating heavy shipments during the winter and early spring, the Rio Grande Southern R. R. is to undertake the tunneling of the Ames Slide, for the purpose of draining this obstacle to traffic. Bids have been invited from mining men familiar with the problem. The draining of the huge mass of ground was decided upon as the best method of overcoming the difficulty, after a consultation with mining men of the vicinity. The Ames Slide is a block of ground a quarter of a mile long, three-quarters of a mile wide, and ranging in depth from twenty to several hundred feet. As this mass of ground accumulates the melting snow-water from the higher slopes, it becomes a creeping avalanche of mud, continually encroaching upon the railroad tracks at its lower edge, and only by the continual use of steam-shovels is the track kept clear. The cost of holding the slide in check is estimated to have totaled \$50,000, extended over a period of years. The plans for avoiding this call for driving a tunnel into the slide at some point near the middle, drifts on each side of the main tunnel for a short distance, and a raise at the termination of each drift. It is expected that this system of drainage tunnels will dry out the entire block of ground, stopping the movement permanently.

Baril & Co. have leased the Crown Point from J. M. Belisle. Excavation for the foundation of the Valley View Leasing Co. mill, at the San Bernardo mine, is now under way, and the Rio Grande Southern is putting in a

side-track to the mine. The Belmont Wagner Mining Co. is working 150 men at the mine and mill. A large storage reservoir is being constructed. The Little Bessie mine is under lease and option to T. M. Long, under a two-year agreement, with the option of an extension for another two years. This property is owned by the Basset company, of Bridgeport, Connecticut, and the Adams Express Company.

PARADOX VALLEY.—All producing companies continue to extend their operations and to ship more heavily. New claims are constantly being developed. A shortage of labor still handicaps operations, but the general condition of roads is good, and the ore is transported without difficulty. The number of trucks hauling the ores is being increased; at the present time there are 40 trucks in operation. The demand for ore is so urgent at the Montrose reduction plant that a night line of trucks is running to supplement the day haulage. The Vanadium Company of Colorado continues to dismantle the Old Simmons mill. The superstructure of the new reduction-plant is completed, and the foundations for the machinery are now being laid; some machinery is already in place. The mill of the Primos Chemical company at Vanadium is nearing completion. Old machinery salvaged from the fire is being erected. The Standard Chemical Co. is still short of men, 75 being needed for the Carnotite mines. Two oil-burning 200-hp. engines are being erected at the Naturita plant. The W. L. Cummins Co. of Lansdowne, Pennsylvania, is opening up Bull Canon holdings. O. B. Willmarth, local manager, is buying up a number of claims for the company, and thirty claims are now held.

MICHIGAN

HANCOCK CONSOLIDATED RE-OPENING.—INGOT COPPER PRODUCTION.

There has been a slight increase in the copper production at most of the mines of this district, but the output is not yet at normal. The most important event of the week was the re-opening of the Hancock Consolidated property in charge of Clyde Weed. This opening receives its importance from the fact that John D. Ryan, of New York, controls the Hancock property. The presumption is reasonable that Mr. Ryan would not order the Hancock to re-open unless he looked for a betterment in the copper metal market within 90 days at the outside, and Mr. Ryan is looked upon as having an accurate view of the general metal market. The Hancock Consolidated is the only property in the Michigan district in which Mr. Ryan is interested. Years ago his father tried without success to make the Hancock pay. The Hancock remained idle for 40 years, when it was resuscitated. John Cuddihy is the president of the present operating company. The efforts to make the Hancock pay have so far failed, and many assessments have been levied on the shareholders. When the slump came in the copper market last may the Hancock was the first mine to suspend. In the meantime the company sold mineral land to the Quincy for \$225,000, which will provide sufficient funds to resume operations. The work now will be directed to

developing sufficient ore so that when shipments of ore do actually commence again the property will be in position to maintain a reasonable tonnage to the mill. The quality of the Hancock ore has been good enough to assure remuneration to the shareholders if the tonnage could be put up to 1000 daily. Hancock sold 200,000 lb. of copper for 22c. 40 days ago.

Of particular interest to engineers is the water intake tunnel which the Mohawk company is running out into the lake at Gay, the site of their stamp-mill. This tunnel now has attained a distance of 1920 ft. It has to run another 900 ft. before the terminal is constructed.

Calumet & Hecla's haulage lateral will have its terminal at No. 7 shaft, Hecla, which will be reached within 50 days. Then it will extend to No. 12, South Hecla. It will, of course, take in the North Tamarack shafts, now part of the Calumet & Hecla mine proper. Calumet & Hecla now is running 20 heads three shifts per day, handling 7500 tons.

Franklin cross-cut to the vein ought to get into copper November 10. It has 40 ft. yet to go. Following this opening in the lode the shaft will be extended to the 41st level and the vein will then be tapped by a cross-cut from that point.

The production of ingot copper from the mines of the Michigan copper district for the month of September 1919 was 14,997,529 lb., a decided increase over the output for August month, when it was 13,302,866 lb., and a material increase over the showing for July. At the same time the production is far from normal, 80% being a liberal interpretation of the figures.

The outstanding feature of the monthly showing is the doubling of the production of the Mass Consolidated, that Ontonagon property going from 100,000 lb. to 200,000 lb. in one month. Another conspicuous showing is made by the Allouez. While this mine increased its copper output by more than 50%, the most important betterment was shown in the copper content of the ore, the showing for September being 24 lb., compared with 18 lb. per ton for August. Similarly there was a betterment in Centennial of 3 lb. per ton.

The following is a tabulated statement giving the results in actual copper produced at all the mines of the Michigan copper district. For some of the mines the figures are official smelter and mine records; for others they are estimates, but the approximations are conservative in each instance.

| Mine | Ore tonnage | Lb. per ton | | Refined | |
|-------------------|----------------|-------------|-------|-------------------|-----------|
| | | Sept. | Aug. | Sept. | Aug. |
| Ahmeek | 61,720 | 22.3 | 22.2 | 1,378,987 | 1,245,300 |

NEVADA

SHIPMENTS FROM THE FLORENCE DIVIDE LEASE.—LABOR
SITUATION AT TONOPAH AND DIVIDE.

GOLDFIELD.—Smelter returns from the shipment made in August by the Florence Divide lease on the Florence Goldfield show the value of the shipment to have been \$93,553. There was 368 tons of ore of an average value of \$254 per ton. Transportation charges amounted to \$5865, including \$2545 for the ore shipped by express. Treatment charges were \$4231, making the total transportation and treatment charge \$10,096 and leaving a

believed there are important possibilities for opening low and high-grade ore toward the boundary line of the Cornishman claim of the Florence, where the principal early-day work was done by lessees. The Red Hill is saving ore for shipment in the south drift on the 500-ft. level. The shoot is from 12 to 18 in. wide and the average value of the ore as broken for the width of the drift is \$17. Assays of as high as \$240 have been obtained from narrow seams of quartz in the shoot, which has been driven on for 75 ft. The face of the drift is estimated to be 650 ft. south of the Florence fault in the Rogers vein, be-

A VIEW OF MOUNT WILSON, IN THE SAN JUAN REGION, COLORADO

net return from the smelter of \$83,457, of which the lessee received 75% and the parent company 25%. The shipment was divided into 15 lots, seven of which were umpired, with the result that the value was raised \$500. Eight carloads shipped in bulk had a value of \$31,249. Three lots of about 10 tons each were worth a total of \$44,953. The richest ore consisted of 3492 lb., assaying \$9935 per ton, or a total of \$17,351. H. G. McMahon, secretary-treasurer for the Goldfield Development Co., is in New York to assist A. I. D'Arcy, vice-president and general manager, in closing negotiations whereby the company is to receive \$300,000 to be used in enlarging the mill to 2000 tons daily capacity and in exploration of the mines controlled by the company aside from the Combination and Red Top, which are now in condition for production. Much of the mine development to be done with this money will be in the Jumbo, where it is

yond which geologists have predicted ore will not be found. Both the Red Hill and Florence are searching for orebodies south of this fault. The cross-cut to the vein at a depth of 420 ft. in the Cracker Jack has been driven 90 ft. and the face still is in foot-wall material. The vein should be cut within a short distance. The east cross-cut on the 252-ft. level of the Lone Star has been driven 458 ft. from the shaft and the face is now in andesite, indicating the approach to the vein, which is the objective of the work. This vein, which is supposed to be the same that produced \$70,000 in the adjoining Commonwealth, has been exposed on the surface of the Lone Star claims for a width of from 9 to 12 ft. and for a distance of 700 ft. A cross-cut has been started on the 252-ft. level toward the downward extension of the ore-shoot in the Lone Star from which \$30,000 was shipped by the Patrick lease. This is the first attempt to reach

under this ore-shoot. The south drift from the Hartley shaft in the Examiner claim has been driven 74 ft. and a cross-cut has been extended 48 ft. from it to explore the shale foot-wall of the vein. The surface of the Examiner and Blue Grass claims are being prospected.

DIVIDE. What is believed to be the continuation of the Divide Extension Caldwell shaft vein has been opened at a depth of 55 ft. in the White Caps claim of the Dividend. The shaft in which the discovery was made is 400 ft. north of the Caldwell shaft. An assay of \$57.70 was secured from a 6-ft. width. Seams of quartz have been exposed in the cross-cut being driven on the 400-ft. level of the Divide Extension main shaft to intersect the downward extension of the orebody opened at a depth of 100 ft. in the Caldwell shaft, indicating that the vein is being approached. Ore assaying \$19 per ton over a width of 6 ft., with seams showing horn silver, has been found in the Kernick vein in the Hasbrouck tunnel. The labor situation is improving rapidly in both Divide and Tonopah, but just what the operators eventually will do remains to be seen. The Divide operators seem anxious to give the men a 50-cent increase and a co-operative store and get things there on a sound basis, but the Tonopah operators do not seem to care in particular whether their mines re-open or not, and they undoubtedly oppose concessions at the frequent meetings being held in Tonopah.

UTAH

SUIT AGAINST THE SILVER KING CONSOLIDATED.—ACCIDENT AT THE UTAH APEX.

SALT LAKE CITY.—Hearing was commenced in the United States District Court in Salt Lake City on October 16 in the case of the United States against the Silver King Consolidated Mining Co. of Park City (Solon Spiro, president) to collect something over \$6400 alleged by the Internal Revenue Department to be due as income tax for the year 1913. The suit hinges on whether or not a part of the revenue of the mining company should have been regarded as taxable income. The complaint alleges that the Silver King Coalition Mines Co. in 1913 paid the defendant company the sum of \$641,312 as a judgment for ore extracted from the property of the Silver King Consolidated by the Silver King Coalition. The Government seeks to collect \$6413 as an income tax, together with 5% penalty and interest at the rate of 1% per month from June 30, 1914.

BINGHAM.—An unfortunate accident happened in the Utah Apex mine on the morning of October 14. E. Conway Ashton, a member of the law firm of Bagley & Ashton of Salt Lake City, had been retained for some time by the Utah Apex Co. in its suit against the Utah Consolidated Mining Co., which is to come up in the United States District Court November 4. On the afternoon of October 13, Mr. Ashton went to Bingham in company with O. P. Peterson and Albert Burch, geologists, to examine the mine for the purpose of gathering evidence for the case. About 8:30 on the morning of the 14th, in company with the two geologists, V. S. Rood, the superintendent, and John Cooney, the mine foreman, Mr. Ash-

ton entered the mine on a tram-car. About 2000 ft. in the adit the tram-car on which they were riding was struck by an ore-train. All the party, except Mr. Ashton, jumped from the car when the ore-train came suddenly around a rather sharp curve. Mr. Ashton was shaken from the tram-car by the impact with the ore-cars, and apparently broke his neck in the fall. He was immediately removed to the residence of Mr. Rood, and although medical assistance was summoned from both Bingham and Salt Lake City, he failed to regain consciousness and died three hours after the accident. Mr. Ashton, who was but 39 years of age, was one of the most prominent and successful attorneys of Salt Lake City. He is survived by his wife and four children.

WASHINGTON

STEVENS AND OKANOGAN COUNTIES.

STEVENS COUNTY.—The ore which had accumulated in the bins has been shipped by the Electric Point company. This company is considering the installation of a second section of an aerial tramway to ship the entire output of the mine to the railway the full distance of ten miles, and thus reduce the cost of shipping. The mine is operated by shaft and adit openings to a depth of 300 ft. The company has been looking for an increase in the price of lead before shipping a large quantity of available ore. In the Loon Lake district the Loon Lake Copper Co. is developing a new body of ore at a depth of 500 ft. This is believed to be a separate body and not connected with one under development at a depth of 100 ft. It is expected the new discovery will double the present output of ore. It is possible that it may connect with the body of ore which was developed between the 200-ft. level and the surface and paid dividends. It has been cross-cut and found to assay 4% copper. The Colville Valley Coal Co. has erected at Valley a boiler, pump, and air-compressor, capable of driving three or more machine drills. The entries to the mine are at depths of 250, 310, and 380 ft., and the mine is looking well on each level. A dam is under construction, to impound the mine water.

The United Copper Co. shipped in August seven carloads of coarse concentrate, one carload of fine table concentrate, and three carloads of high-grade ore. The concentrate contained 20% copper and 80 oz. silver per ton and had a total value of about \$5000. The ore came from stopes on the 1400-ft. level. The gross value of the August shipments was approximately \$27,000. Since the latter part of July a raise was carried up 165 ft. from the 1000-ft. level and penetrated a body of low-grade milling ore, which it is estimated will yield upward of 50,000 tons. An orebody 10 ft. wide has been intersected 600 ft. north of the shaft, on the 1200-ft. level. It is of milling grade, with small inclusions of gray copper. Under new management 175 tons of ore has been treated daily in the mill, and it is expected the quantity will be increased to 250 tons daily. The mine and mill now give employment to 87 men. The mill is being operated on three shifts.

OKANOGAN COUNTY.—The mine being operated by Atkins and Grant is on the Alice claim, formerly called the No. 1, and the mill, situated on the Shamrock claims, is grinding concentrate. The Shamrock long since presented a good showing, but the most valuable discovery on this group was recently made at a depth of 55 ft., in a shaft on the Alice claim, where the ore is rich in silver, copper, and lead. No. 1 was prospected twenty years ago in an open-cut and was then considered a rich prospect, but it was neglected because of more important and surer attractions and the lack of reasonable transporta-

200-ton concentrating plant at the Noble Five mine, which is similar in type to that at Alamo. On the Standard, formerly the banner producer of the district, new areas of promise are being developed. The McAllister, Surprise, and Ivanhoe are other prospects mentioned by the Minister as being promising. Mr. Sloan stated that he always had been an optimist where Slovan was concerned and now was more than ever convinced that his faith was justified. Mine operators took advantage of his presence to represent the desirability of the construction of a road connecting the communities of New Denver and

HYDRAULICKING AT TEN-MILE, IN THE TROUT LAKE DISTRICT, BRITISH COLUMBIA

tion rates. The Copper World Extension mine, in Palmer mountain, has been for some time under lease to Charles Dempster, of New York, who, with two sons, aided by New York capital, has expended \$80,000 on machinery, development, and a Riblett tramway for conveying ore from the mine to the base of the mountain.

BRITISH COLUMBIA

NELSON, STEWART, TRAIL, BARKERVILLE.

NELSON.—Hon. William Sloan, Minister of Mines, visited the Slovan district in the course of a tour he has been making of the Eastern mining districts of the Province. He inspected a number of the well-known silver-lead properties of the district, among which was the Silversmith, formerly known as the Slovan Star. Entering on the tenth level, where a good ore-shoot was opened up last year, he explored the workings up to the eighth level. Mr. Sloan reports that the new concentrating plant, installed at Alamo by Clarence Cunningham, is working well. Good progress also is being made on the

Sandon and also of providing means of transportation by wagon-road with Nelson by way of Slovan City. Mr. Sloan expressed his appreciation of the benefit these works would be to the mining industry and promised to do all he could to assist in securing the necessary appropriations.

That immediate action should be taken by the Dominion government toward the establishment in British Columbia of an ore-testing plant is the opinion of members of the Nelson Board of Trade, as well as of the mine operators generally throughout the Kootenay and Boundary districts. The Government already has provided the finances for the enterprise but as yet has taken no steps to construct necessary buildings and install the plant. There has been some discussion as to the most suitable site but it is thought that Nelson, now that it does not seem likely to go to the B. C. University, Vancouver, will be chosen.

STEWART.—The newly organized North Coast Branch of the Canadian Mining Institute held a meeting re-

cently at Stewart, with Major Angus Davis, general manager of the Dolly Varden mine, as chairman and E. J. Conway, field engineer for the Granby Consolidated Mining & Smelting Co., as vice-chairman. Roy Clothier, of Stewart, acted as secretary. E. E. Campbell, mine manager at Anyox for the Granby company, in the course of an address referred to the re-awakening of interest in the Portland Canal district and said that he looked to Stewart and the adjacent mineral zone to develop into a really exceptional camp. Although it was not generally known, the Granby Hidden Creek mine was the biggest copper mine in the British Empire. The Dolly Varden, at Alice Arm, was a fine property in a splendid district and he looked for big things there. "I am not given to making prophesies," Mr. Campbell continued, "but I believe that Stewart will become the chief mining centre in northern British Columbia. I traveled all over the North-West from Washington to Alaska when I was in the field for the Granby, and I never saw a district with the possibilities that this has." Speaking of the aims and objects of the Institute and of work which it might undertake, Mr. Campbell mentioned the matter of the removal, or at least the lowering of the tariff on mining machinery. This duty was one of the chief obstacles to development, especially in the early stages, the time when mining property required every encouragement.

TRAIL.—J. J. Warren, president of the Consolidated company, who has been in Europe seeking markets for the company's products, has announced that the demand for zinc in Europe, South Africa, and India is practically unlimited, and that Canada is capable of supplying one-tenth of the world's demand. The condition of the zinc market, in his opinion, would warrant his company in making the necessary expansion to meet this demand. One of the first moves in this direction probably will be the erection of a large concentration plant at the Sullivan mine, at Kimberley, which is the largest zinc producer in British Columbia and is capable of considerable expansion. Last year the Province produced over 20,000 tons of zinc, of which the Sullivan provided 13,300 tons. The ore receipts at the Trail smelter showed a slight falling off for the week ended October 7 owing to the strike at the Sullivan mine and at the North Star mine.

CARIBOO.—A rich discovery is reported to have been made by the Lightning Creek Hydraulic Mining Co., on Amador creek. A shaft was sunk 500 ft. ahead of the working face, and a channel containing heavy-nugget gold was struck. Though it is late in the season, the management expects to make a good clean-up before shutting-down for the winter. Messrs. Roberts and Bryce with associates in Toronto and Cobalt have purchased eight claims near Barkerville for \$250,000. Two veins, averaging 17 and 42 ft., respectively, and assaying \$17 to \$20 per ton in gold, have been exposed at intervals over a considerable length. Tommy Burns, ex-champion pugilist, and J. P. McConnel, late editor of the Vancouver 'Sun', are sinking a vertical shaft at Antler creek.

BARKERVILLE.—Placer gold production in the Cariboo district this season has been considerably in excess of that of last and with development promised on the Prosperpine Quartz claims, which recently were acquired by eastern Canadian interests, considerable mining activity is assured next year. With reference to the quartz properties, R. A. Bryce, who is in charge of the work of opening them up, states that about forty men will be employed during the winter. Word also comes from Stanley that what is described as an important discovery of gold has been made by the Lightning Creek Hydraulic company, where they are operating above the mouth of Amador creek. The discovery was made by sinking a shaft about 500 ft. ahead of the face. Here they struck a channel apparently overlooked by the old timers. L. A. Bonner, the manager, states that the gold is heavy lead gold and typical of the channel gold of this section. Although the season is well on he expects to make a substantial recovery before operations cease.

ONTARIO

DISCOVERY OF PITCHBLEND, —HOLLINGER STATEMENT.

BUTT TOWNSHIP.—A discovery of pitchblende has been reported in Butt township in the Nipissing district. It was found by William Elliott, a prospector who had taken out a claim for mica. An assay by Ledoux & Co., of New York, showed the pitchblende to be unusually rich in uranium content of 63.60%. This is the second discovery of radium-bearing mineral reported to the Ontario Bureau of Mines since the Government offered a reward of \$25,000 for the first discovery of radium in commercial quantities, the previous find being of euxenite, in Lanark county. In both cases the reward has been claimed, but the matter is still in abeyance as it has not yet been shown that the mineral occurs in commercial quantities. C. W. Knight, of the Ontario Bureau of Mines, who has examined the scene of the discovery, states that the pitchblende was found in a coarse granite pegmatite dike in association with mica, tourmaline, and other minerals in small quantity. The country rock of the region is pre-Cambrian, and is composed of banded gneisses cut by numerous pegmatite dikes which extend over a large area. It is considered possible that they may be found to carry pitchblende or some other radium-bearing mineral in economic quantities.

LARDER LAKE.—The Associated Goldfields Mining Co. is undertaking to mine large bodies of low-grade ore on a scale not yet attempted in Ontario. Its properties comprise about 2000 acres, of which 1600 are mining claims and the remainder water-power rights-of-way. The plan of development is to block out the orebodies on three of the properties known as blocks B, C, and D, formerly the Harris-Maxwell, Kerr-Addison, and Dr. Reddick mines, and ascertain the tonnage and its tenor in gold. About \$1,000,000 has already been spent on the installation of the water-power plant, erection of buildings and machinery, and development of the orebodies. A shaft has been sunk on block B, a hill of ore 1000 ft. long by 130 ft. wide, to the 500-ft. level, and an adit run directly across

the body at the 100-ft. level. Driving and cross-cutting has proceeded at the 500-ft. level, where the orebody proves to be 300 ft. wide. It is stated that the engineers have proof that the ore can be milled at a profit to compare favorably with other mines, and a mill will shortly be erected with a capacity of 5000 tons per day. Block C, seven miles distant, is a hill of mineralized rock 1250 ft. long and about 300 ft. wide at the surface, rising 300 ft. above lake level, and proved by diamond-drilling to be 500 ft. wide at the 500-ft. level. It is now being explored by diamond-drilling and surface pitting and blasting. The plans of the company include the erection of another 5000-ton mill to treat the ore from this mine and from Block D, otherwise known as the Dr. Reddick, adjoining, where the ore is stated to be of somewhat higher grade. The Associated Goldfields ore is stated to average \$5 per ton.

SKHAD TOWNSHIP.—An important gold discovery has been made in Skead township, an outlying district of the Boston Creek area, by Walter Manley, a returned soldier. Spectacular gold showings occur in a dike upward of 25 ft. in width composed of altered porphyry intersected with quartz veins. Six claims, which had lapsed owing to the non-performance of assessment work, were re-staked by Manley and William Reilly and are known as the Manley-Reilly group. Other discoveries have drawn the attention of prospectors and mining men to this field.

PORCUPINE.—A statement of the Hollinger Consolidated covering the period from January 1 to September 9 shows a total income of \$4,839,845, expenses \$2,433,958, and net profits \$2,405,887. Dividends amounting to \$984,000 have been paid and \$1,421,887 added to surplus. The total surplus now stands at \$3,493,174. The total number of employees, which stood at 1344 on June 17, was only 1187 on September 9. The cost of treatment of ore per ton was \$4.82, as compared with \$4.95 for 1918, and the average value of ore treated was \$9.99, compared with \$10.24 in 1918.

SONORA

NACOZARI CONSOLIDATED DISCOVERS GOOD ORE.—ACTIVITY AT CANANEA.

NACOZARI.—An ore-discovery of considerable importance was made in the main working tunnel on the Galera group of the Nacozari Consolidated Copper Co., when the diabase wall of the copper vein toward which the company had been driving for twelve years was struck 4000 ft. from the portal of the tunnel and at 600 ft. vertical depth. A full face of brecciated rock shot with bornite and chalcopyrite, similar to the ore of the Moctezuma Copper Co., whose property adjoins the Nacozari Consolidated, has been opened. At the same time a heavy flow of water, considered certain confirmation of the proximity of the brecciated zone, was struck. This is typical of the district. The water, while not impeding work, because drainage in the tunnel is comparatively simple, guarantees sufficient supply for milling operations. Although every carload of rock brought out of the drift shows copper, it will require between 100 and 150 ft. of driving

before the big bodies of ore are intersected, according to calculations of the management. At present engineers are running a survey to determine the exact location of the main breast. It is believed to be about one mile from the mining camp of Pilares and approximately 1000 ft. from the south-eastern corner of the Pilares property of the Moctezuma Copper Co. The Nacozari Consolidated was incorporated in 1907 with a capitalization of \$6,000,000. It is a low-grade copper property, the main vein of which is about 600 ft. wide. This is the vein which has just been cut. In addition it has veins of gold, silver, copper, and lead. Underhand stoping, similar to that employed in the Pilares mine, has been adopted. The ground stands well and but little timber is required. In addition to the Galera group the Nacozari Consolidated is working the San Pablo, a small silver property. From this about one ton of high-grade silver ore, occurring in small streaks or veins, is removed daily, together with a considerable tonnage of low-grade milling ore. An average of a carload of this silver-lead ore and concentrate is shipped monthly to the El Paso smelter for reduction. The company has acquired a lease upon the San Pedro group of the Moctezuma Copper Co. and from a ravine in this property has driven a drainage-tunnel to connect with the bottom of the working shaft of the San Pablo. This tunnel, which will be between 1100 and 1200 ft. in length when completed, probably will be finished in a few weeks at the present rate of progress. This will allow the working of the San Pablo on a more extensive scale than ever before. A 150-ton mill, equipped with flotation apparatus, stands upon the property. John G. Alexander, of Douglas, Arizona, is president of the company; Thomas D. East, Trinidad, Colorado, vice-president; Byron R. Russell, Douglas, secretary; Roy Hiatt, Douglas, treasurer; Rufus R. Humphrey, Malone, New York, Reginald C. Heath, Boston, Massachusetts, and George Motz, Douglas, directors. Mr. Motz also is mine superintendent and geologist.

CANANEA.—Increased activity is being shown by the mines of this district after a quiescent period of several months. The Democrata Mining Co., owned by the Hoffman interests of Cincinnati, Ohio, C. E. Hoffman, manager, blew-in one furnace of its smelter early in October and resumed mining operations. About 300 men are employed at present. Another furnace will be blown-in as soon as machinery for adding to the power-plant equipment has arrived, which is expected within a few weeks. The Calumet & Sonora, owned by the Norton interests, Mr. Sanford, manager, has resumed operations in both the mining and mill divisions. At present these are on a small scale; it is intended to increase production and force as conditions warrant. This is a zinc-silver-lead-copper property. The Cananea Consolidated Copper Co. is working practically all its mines in the district and employing approximately 3000 men in mining and reduction divisions. In the smelter six furnaces and one reverberatory furnace were in operation the latter part of September. It is understood that it is intended to maintain about the same production this month as last.

SUSPENSION OF ASSESSMENT WORK

Letters from Washington state that it is improbable that the five-claim limitation of H. J. R. 150, suspending assessment work on mining claims for 1919, will be withdrawn. An amendment removing this limitation is now pending, but its chance for passage is so small that miners who hold claims should plan to perform their assessment work in accordance with H. J. R. 150, as it now stands. Under an interpretation of this, made by the Department of the Interior, if an individual, either directly or as a member of an association or a corporation, claims exemption from the performance of assessment work upon five claims in which he holds an interest, no matter how small the interest, he shall be barred from claiming exemption from assessment work upon any other claims he may own in full or in part.

ALASKA

Seward Peninsula.—More than \$2,000,000 in gold was mined on the Seward peninsula this year, according to Jafet Lindeberg, president of the Pioneer Mining Co., and one of the discoverers of Nome's gold-bearing sands. This year's output was \$750,000 greater than last year's.

Susitna Region.—Fred P. Davy of Seattle has optioned a group of four claims from Dolf Smith and William Trout, situated near the head of the North Fork of Kashwitna river in the Talkeetna mountains. There are two known veins on the property said to occur on or near the contact of the quartz-diorite of the Talkeetna range, with andesitic greenstone, dacites, and rhyolites of the Skwentna group. The prospects were discovered by William Smith in 1904 when the Alaska Northern railroad was projected from Seward, but owing to the failure of the project, nothing was done on the claims. They are now rendered accessible by the Government railroad. Supplies will be freighted from Kashwitna station in March, and exploration and development will follow as soon as weather and climatic conditions permit in the spring.

ARIZONA

Crown King.—Kingdon and Gilbreath have six men working on the Tuscumbia, cleaning out the old drifts. The Springfield is under lease to the Nelson brothers. The old Bullybueno gold mine, ten miles north of Crown King, is being worked by M. Roland, of Hooper, under bond and lease.

CALIFORNIA

Engelmine.—J. E. Patrow has started development of promising orebodies on the Lone Rock and Lone Star properties. The mines are about ten miles from the Engels group and contain gold-bearing ore. Carl Johnson, Frank Stevenson, and I. Turner, all of Westwood, are interested in the Lone Rock, which is reported as developing well.

Kennett.—Sixty men are working at the Mammoth mine and four mills are engaged in exploratory work. Shipments of silicious gold ores continue to arrive from the Reid mine, at Old Diggings, and other properties, and are stored in the smelter yards. There is no indication of an early resumption of smelting. William Meeks is preparing to re-open the Meeks gold property at Quartz Hill. It has been idle several months.

Klau.—The old Klau quicksilver mine has been taken over by Ellard W. Carson and associates. The plant is being rehabilitated and development work is also under way.

Last Chance.—The Forest Hill Divide is showing much activity. Rich gravel has been uncovered in the Excelsior, at Forest Hill, and the Glenn, at Last Chance, is producing the richest gravel ever found on the property. Frank Tilfoston is superintendent. George McAuley of Auburn, former Sheriff of Placer county, is heavily interested in the Excelsior and Gem.

Murphys.—The main orebody of the Tanner mine has been intersected 300 ft. below old workings by the 1300-ft. tunnel started two years ago. At point of discovery the vein is 3 ft. wide, compared with 10 inches in the old lateral. Operated by the East Belt Development Co., the Tanner is equipped with a seven-stamp mill and mine plant. The working force is to be immediately increased and drifts extended along the orebody. C. W. Canfield is manager.

IDAHO

Coeur d'Alene.—Official announcement was made October 9 by district miners' union No. 14, International Union of Mine, Mill and Smelter Workers, that the strike in the Coeur d'Alene, which has been in effect since July 15 last, was at an end, in the following brief announcement: "Notice to all miners and mill men: The strike has been declared off at all mines and mills in the Coeur d'Alene district." It is predicted that within the next week or ten days at least 1000 miners will come into the district seeking work in the mines. Hundreds of miners who left the district immediately after the strike was called are expected to return. Wages paid in the Coeur d'Alene are high and working conditions, in spite of charges to the contrary, are good.

Lookout.—The orebody on the property of the Bullion Mining Co. has been followed by a drift for 50 ft. on the deep tunnel level.

Wallace.—The orebody discovered recently on the 500-ft. level of the Consolidated Interstate-Callahan mine is expected ultimately to double the present ore-reserves. The zinc content is about 30% and is equal in value by the lead and silver content, according to an earlier report.

MONTANA

Neihart.—The Cascade mill is treating 150 tons per day by concentration and flotation, with satisfactory results. Frank R. Wicks, who has been experimenting on the treatment problems at the Cascade mill, states that it is planned to increase the capacity of the mill to 500 tons per day.

NEVADA

Battle Mountain.—Officials of the Copper Canyon Mining Co., owning properties at Copper Basin, about seven miles from Battle Mountain, have been advised that Governor Boyle and Messrs. Cole and Lord, Labor Commissioner and Federal Mediator respectively, will endeavor to settle the strike of miners which has tied up operations at Copper Basin for several weeks. The men were granted an advance of 50 cents per day, but went on strike when board was raised 25 cents daily.

Eureka.—The old Richmond-Eureka company, whose

mines have been shut-down for several years, has been sold to Eastern men. The price is stated to be \$9,500,000. The mines were first opened in 1869, and yielded \$72,000,000 before they were shut-down owing to unfavorable freight rates.

Goldfield.—Reorganized Crackerjack Co. has arranged with the Florence Goldfield Co. to take over the lease now operated by the Florence Divide Co. on January 1, 1920. The lease is reported to be shipping \$20,000 to \$40,000 weekly and is working ground above the 400-ft. level. Control of the lease by the Florence Divide Co. expires December 31 and an extension was refused following a misunderstanding. Driving on the east vein has begun from the 320-ft. level of the Crackerjack, and cross-cutting continues from the 440-ft. level to open the Crackerjack vein.

Loring.—A small vein, carrying good silver and copper ore, is being developed on the Ethel group, one and one-half miles south of the Nevada Honey Bee. Three additional miners have been put on surface prospecting at the Nevada Honey Bee, while Tom Ward is opening up the find he made last week. The free gold showing and the pannings are encouraging. The Benedetti tunnel is in 307 ft. and the Malley shaft is down 160 feet.

Seven Troughs.—The mill of the Seven Troughs Coalition Co. has been started on ore from the dumps of the Mazuma Hills mine, which is being operated under a five-year lease by Charles Spencer, of San Francisco.

Tonopah.—All Tonopah mills have resumed operations save the Tonopah Extension. Most of the plants are running short-handed, but working crews are being steadily increased. The West End is receiving a large tonnage from leases on the Montana, in addition to its own output. The MacNamara plant is running on ore from the Tonopah Divide, Tonopah Hasbrouck, and Divide Extension.

WASHINGTON

Stevens County.—The O-Lo-Lim Co. is installing larger machinery for the operation of its mine near the Detillion bridge on the former Spokane Indian reservation. James Keeth, manager, is putting in a large pump and air-drill compressor, with sufficient engine power to operate them. The mine is near the North Star state highway projected from Davenport to Meyers Falls, which is partly built and will be completed next year.

BRITISH COLUMBIA

Trail.—The Consolidated Mining & Smelting Co. received 4073 tons of ore in the first seven days of October. The receipts in detail follow:

| Mine | Tons |
|------------------------------------|------|
| Bluebell, Riondel | 183 |
| Black Bear, Rossland | 231 |
| Centre Star, Rossland | 1400 |
| Consolidated Mines, Clines | 28 |
| Highland, Cinar Creek | 105 |
| Iron Mask, Kamloops | 42 |
| Josie, Rossland | 502 |
| Loon Lake, Loon Lake | 32 |
| Lone Pine-Surprise, Republic | 114 |
| Mandy, The Pas | 468 |
| Monarch, Field | 78 |
| North Star, Kimberley | 404 |
| Ottawa, Slocan City | 50 |
| Paradise, Athalmer | 44 |
| Quilp, Republic | 148 |
| Ruth, Cedar Creek | 100 |
| San Poil, Republic | 57 |
| Sullivan (zinc), Kimberley | 62 |
| Velvet, Velvet | 25 |
| Total | 4073 |

Personal

The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

Thomas M. Bains, Jr., is at Mariposa, California.
Jafet Lindeberg has returned from Nome to Seattle.
R. L. Chase is at Grand Valley, Colorado, on oil-shale work.
Charles C. Brackin, of Cleveland, is now resident in San Francisco.
Edward H. Benjamin was married to Mrs. Lucile Joullin, on October 17.
C. W. Purington has returned from Vladivostok to London by way of the Suez Canal.
Thomas A. Wetzel is taking charge of milling operations near Cosala, in Sinaloa, Mexico.
A. F. Keene, of New York, passed through San Francisco on his return from Searles Lake.
Sidney J. Jennings has been inspecting the Carson Hill mines in Calaveras county, California.
D. H. Ferry is in charge of the Yukon Gold company's dredging operations at Murray, Idaho.
Lyon Smith has become superintendent for the York Ferro-Alloys Co., at York, Pennsylvania.
B. F. Grant is in central Sinaloa on oil-flotation work for the Southwest Engineering Co. of Los Angeles.
C. M. Eye has returned from the Philippine Islands and expects to remain in Southern California for a while.
Austin H. Merrill, president and general manager of the Merrill Silver Lead Co., Goldfield, Nevada, is in New York.
A. M. McDermott, of Los Angeles, has become general manager for the El Fuerte Mining & Smelting Co. in Sinaloa, Mexico.
W. W. Lytzen, formerly geologist to the Interstate-Calahan Co., is now manager for the Big Ledge Copper Co., at Huron, Arizona.
Pepperberg, Reeves & Meredith have moved their offices from Mineral Wells, Texas, to Great Southern Life Bdg., Dallas, Texas.
Charles W. Newton, superintendent of the Con. Interstate-Calahan mine, in the Coeur d'Alene, is in a hospital at Rochester, Minnesota.
H. De Witt Smith, superintendent of mines for the United Verde Copper Co., has returned to Jerome, after visiting the Coeur d'Alene region, in Idaho.
Thomas A. Janney, superintendent of the Arthur plant of the Utah Copper Co., was married on October 11 to Miss Margaret Collins of Salt Lake City.
S. J. Speak, of the firm of Hooper, Speak & Co., London, has been visiting the electrolytic zinc plants in California, and is now on his way to Trail, B. C.
H. C. Bayldon, manager of the Athasar and Spassky mines, is on his way hither from Shanghai, having been driven out of Siberia by the Bolsheviks.
Morton Webber has been engaged in examination work at Globe, Arizona. He is now at the Empire copper mine, at Mackay, Idaho, in his capacity of consulting engineer.
Roy A. Sulliger, formerly mill superintendent at Minas del Tajo, Rosario, Sinaloa, is now general superintendent for the Estaca Mining Co., Contra Estaca, Sinaloa, Mexico.
G. B. Lyman, of the Copper Queen geological office, has started a class in practical geology, in connection with the educational classes offered by the company to its employees.
Carl Scholz, of Chicago, has been elected vice-president and general manager of the Raleigh-Wyoming Coal Co., a West Virginia corporation with headquarters at Charlestown. Mr. Scholz was chairman of the executive committee in charge of the Chicago meeting of the A. I. M. & M. E.

R. H. MacMasters Co., recently organized to conduct a general stock brokerage business, has opened offices at 69 Wall St. **R. H. MacMasters** and **Ray D. Harris** are general partners in the business, and **Walter Harvey Weed** is a special partner. The firm is a member of the Consolidated Stock Exchange of New York.

R. T. Walker, for the past two years superintendent for the Virginia Louise Mining Co., arrived in Salt Lake City on October 15 to accept the position of assistant manager of the smelting department of the United States Smelting, Refining & Mining Co. This position was formerly held by **W. Allen Howard**, who was recently promoted to manager of the smelting department.

Obituary

Henry A. J. Wilkens was born at Baltimore, Maryland, on December 18, 1867, the son of Henry and Therese Wilkens. He received his early education at the Friends School in that city and at the age of 15 entered Lehigh University. There he took the scientific course, graduating in 1887, one of the youngest men in his class, with the degree of Bachelor of Science. He took a year's post-graduate work at Lehigh, receiving in 1888 the degree of Mining Engineer. In September, 1888, Wilkens matriculated at the Royal Mining Academy, at Freiberg, as a special student. He remained at Freiberg studying under Ledebur, Richter, and other famous German professors for two years and spending the vacations in taking practical courses at mines and smelters throughout Germany. On completion of the course he was given the usual certificate stating that he had completed his studies satisfactorily. In the fall of 1889 he returned to the United States and after a short period in the employ of the Empire Zinc Co. at Joplin was engaged by St. Louis mining interests to take charge of a small mine that they were prospecting and developing in the mountains east of San Diego, California. In the summer of 1890 he returned to the East and took the position of chemist for the Lehigh Zinc & Iron Co. at South Bethlehem, Pennsylvania. This was the beginning of a friendship and business association with August Heckscher and John Price Wetherill that continued for many years. Mr. Heckscher, in speaking of his work at that time, said that Wilkens was so quick with his analyses that for some time they suspected him of guessing at results, but that the most careful checks showed that he was always correct in his determinations. In 1891, still in the employ of the Lehigh Zinc & Iron Co., he was sent to the Franklin mine as Mine Engineer and Surveyor, and remained there throughout the time of the sinking of the Parker shaft. In the winter of 1894 and 1895, with the late H. B. C. Nitze, he entered the employ of the Geological Survey of North Carolina, and under the direction of Dr. Holmes, then State Geologist, made a complete survey of the gold deposits of the Southern Appalachian range from North Carolina to upper central Alabama. As a result of this work he and Nitze collaborated in writing two articles, one entitled 'Gold Mining in North Carolina and Adjoining South Appalachian Regions,' which was published in the North Carolina Geological Survey Bulletin No. 10, and the 'Present Condition of Gold Mining in the South Appalachian States,' which was published in Volume XXV of the Transactions of the American Institute of Mining Engineers. About this time, in collaboration with Nitze, he also wrote an article on the 'Magnetic Separation of Non-Magnetic Material,' which was published in Volume XXVI of the Transactions of the Institute. In the latter part of 1895 he entered the employ of the Wetherill Concentrating Co. at South Bethlehem and for the following two years he was engaged in work connected with the development and marketing of the Wetherill magnetic separator. In the

winter of 1897 he went to Europe as a representative for that company, and, after long and difficult negotiations, sold the world's rights to the Wetherill patents to interests connected with the Metallurgische Gesellschaft, at Frankfurt, reserving, however, the rights to use the process in treating the ores of the New Jersey Zinc Co. and its subsidiaries. Returning from Europe in 1897, Wilkens entered the employ of the New Jersey Zinc Co. His first duties consisted of general supervision over the operations of the Empire Zinc Co., a subsidiary of the New Jersey Zinc Co., in Missouri, and he was also largely connected with the development of the Schroeder contact process for the manufacture of high-grade sulphuric acid. By means of this process the first acid of this kind was manufactured in the United States. In 1900 the Empire Zinc Co. of Colorado was formed and an office was established at Denver. The operations of this company also came under Wilkens' supervision as well as the building of the mill at Canon City in 1901. During this and following years Wilkens was in general charge of all of the western operations of the New Jersey Zinc Co., the Kansas gas smelters, and various properties in the South-West and in Mexico. He examined and reported on many mining properties, among which were La Burfa and La Penescosa in Mexico, the Wythe mine in Virginia, and the Bertha. On March 1, 1908, he resigned his position with the New Jersey Zinc Co. From then until the latter part of 1911 he practised his profession as consulting mining engineer and during this time made an extensive trip through the West Coast countries of South America, examining many mines and prospects. In December of 1911 he became president of the Mines Management Co. During the next few years, through his connection with that company, he was instrumental in the rehabilitation of several of the old iron mines of New Jersey and Pennsylvania, notably the Mt. Hope and Washington mines of the Empire Steel & Iron Co. On January 1, 1916, he resigned as president of the Mines Management Co., and with Walter B. Devereux, Jr., formed the consulting mining engineering firm of Wilkens & Devereux, of which he was the senior partner at the time of his death. On August 1, 1918, he married Gertrude Wetherill, the daughter of the late William C. Wetherill, at Denver. For the past three years Wilkens had been far from well and during that time was forced to undergo three major operations within a relatively short period. He never fully recovered from the shock and strain of these operations, which undoubtedly were responsible for the sudden weakening of the heart that culminated fatally at Pueblo, Colorado, on the morning of September 13. Wilkens was a member of the Mining and Metallurgical Society of America and the American Institute of Mining and Metallurgical Engineers. He always refused to become a slave to business and stoutly maintained that work was the least important thing in a man's life. While able to concentrate his keen analytical mind, to the exclusion of everything else, on business matters, he also possessed the happy faculty of being able to forget business completely in vacation time. A crack shot and expert fisherman, his happiest days were those spent with his rod or gun with some chosen companion. The size of his catch or the number of birds mattered little to him; what he enjoyed was the outdoor life, and when shooting, watching and studying the working of his dogs. He was a close observer, student, and lover of nature, and possessed an exhaustive knowledge of flora and fauna. His desire for companionship was so great that he always wished to be with friends and was never really happy when alone. His love of children was remarkable and they all loved him. During the last years of his life he took intense interest in a Fresh Air Home for little girls and helped it greatly in financial and other ways. Of his sterling character, his kindness, his charitableness and loveableness, the many devoted friends he leaves behind him are the best proof.—W. B. Devereux, Jr.

THE METAL MARKET

METAL PRICES

San Francisco, October 21

| | |
|---------------------------------------|-------------|
| Aluminum-dust, cents per pound | 60 |
| Antimony, cents per pound | 9.25 |
| Copper, electrolytic, cents per pound | 22.00-22.50 |
| Lead, pig, cents per pound | 6.75-7.75 |
| Platinum, pure, per ounce | \$140 |
| Platinum, 10% iridium, per ounce | \$160 |
| Quicksilver, per flask of 75 lb. | \$80 |
| Spelter, cents per pound | 8.50 |
| Zinc-dust, cents per pound | 11.00-13.50 |

EASTERN METAL MARKET

(By wire from New York)

October 21.—Copper is quiet and easy. Lead is active and higher. Zinc is more active and stronger.

SILVER

Below are given official or ticker quotations, in cents per ounce of silver \$99 fine. From April 23, 1918, the United States government paid \$1 per ounce for all silver purchased by it, fixing a maximum of \$1.01½ on August 15, 1918, and will continue to pay \$1 until the quantity specified under the Act is purchased, probably extending over several years. On May 5, 1919, all restrictions on the metal were removed, resulting in fluctuations. During the restricted period, the British government fixed the maximum price five times, the last being on March 25, 1919, on account of the low rate of sterling exchange, but removed all restrictions on May 10. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the normal rate of exchange.

MONEY AND EXCHANGE

The foreign exchanges seem for the moment to have struck a dead centre, with only mild fluctuations. The situation presents the elements for an interesting debate between opposite theories as to how the balance of effect will result between pressure of export bills and such factors as make for alleviation, including preparations already made, tourists' needs, and the strong possibility that demand for our exports may continue to fall off. The one decisive question probably is the extent to which the latter influence will operate at a season when the outward movement of our raw material is normally greatest.

The action of J. P. Morgan & Co. in raising the rate on British treasury bills, issued each week, from 5½% to 6% is an indication that money is expected to maintain the present high level for some time. It has been the policy to fix the rate in keeping with the money market. The 5½% rate has been carried for several months. It is understood that not more than \$100,000,000 of bills has ever been outstanding, and that the present amount outstanding is between \$50,000,000 and \$90,000,000. It is a sort of revolving loan, new bills being offered as old ones run off. In itself this raising of rates is of no great consequence, but, taken in conjunction with the course of the money market, it becomes noteworthy, especially following the more comfortable outlook in money in August and early September.

The last few weeks the money market has assumed a different aspect, caused by the more active stock market coming at the time of crop movement and usual autumn demands for trade. There appears to be no dearth of money for commercial purposes. Some time ago the rate for commercial paper was lowered to 5% for the best names, and business is still done at that rate. For time money the rate is still 6%. It is only on call loans that banks appear to be getting high rates. The reason advanced is that spare funds for loaning are obtained at expense of re-discounting at reserve banks. The banks have built up a large loan account, to meet the larger reserve on which they have had to have recourse to re-discounting. They discount afford to put out a plentiful supply of cheap call money when committed for a large line of re-discounts. As soon as the banks have reduced re-discounts, the banks may be disposed to put out more money on call. Bankers, however, say this is impossible just now, with the insistent demand for accommodation.

Louis Grumbach, of Speyer & Co., just returned from 10 weeks in Europe, says it will be three years before Germany can again begin to figure in the world's export markets. American assistance is needed. "At present as high as 800 marks per ton (\$200 on normal parity) are paid for imported American coal," he said. England and France are making strong efforts to get the German trade, a message from the English Board of Trade stating that "it is no part of the policy of His Majesty's government to discourage British traders from competing in German trade." The French government encourages its merchants to do likewise, as exchange conditions favor the purchase of German in preference to American goods. Mr. Grumbach said the present republican form of government will surely be retained in power unless living conditions deteriorate materially during the coming winter.

Quotations on October 21 are as follows:

| | | |
|-----------|--------|------|
| Sterling: | Cable | 4.19 |
| | Demand | 4.18 |
| France: | Cable | 8.57 |
| | Demand | 8.58 |
| Libre: | Cable | 9.85 |
| | Demand | 9.80 |

Eastern Metal Market

New York, October 15.

The markets are a little more active, and all of them are firm to higher as to prices.

With the absorption of practically all the outside lots the copper market is higher and firmer, but demand is not heavy.

The general tin market is quiet. There has been fairly heavy re-selling of spot and nearby tin by consumers.

The outside lead market is again on a par with the Trust prices, but buying is not heavy.

The zinc market is steady and firm, but buying is not in large amounts, sellers and buyers marking time until the steel strike ends.

There is no change of consequence in the antimony market.

IRON AND STEEL

It is expected that one effect of the steel strike, which is slowly crumbling, will be that demand will exceed supply and that pressure will be necessary to keep prices from advancing. There is some anxiety as to the effect on the present situation of the Industrial Conference at Washington. Thus far the trend from that source has been to encourage rather than dampen the ardor of the strike leaders. The leading plants of the Carnegie Steel Co. in the Pittsburgh district are operating at about 100%, while others that were shut-down when the strike started are still dead. Buying lately has centred in pig-iron. Heavy export demand for basic iron is now estimated at 75,000 tons, most of it from Japan.

COPPER

A considerable amount of buying appeared about the middle of last week, which has resulted in an evident absorption of most of the outside lots of copper and a decided strengthening of prices. Electrolytic copper, which could be purchased a week ago from outside sources at 21.25 to 21.50c. per pound, New York, cannot now be obtained for less than 22.12½c. and perhaps more for October or early delivery. We quote this as the market for electrolytic with Lake copper at about 22.50 to 23c. for the same position. The large producers continue to adhere to 23.50c. for last quarter, but they may revise this in the near future. The buying referred to last week is said to have started with certain purchasers for foreign account who arranged to have the ingots converted into wire and other products before exportation. The market is stronger than in several weeks and all the outside lots have been either absorbed or withdrawn. Labor troubles are still holding this and other markets in restraint. Total sales last week have been estimated to have amounted to 25,000,000 pounds.

LEAD

The market has been quiet but firm. The outside lots have been nearly, if not all, absorbed and prices are not up to those of the leading interest at 6.25c., New York, or 6c., St. Louis. It is not possible to buy lead from all sellers because they have not got it to sell, due perhaps to a lack of output as well as a well sold-up condition in some cases. Any large demand that might appear now would probably cause a stiff rise in the market. As it is, demand is fair and the market is quiet. Reports are to the effect that in some cases the St. Louis market is higher than 6c. or up to 6.05c. to 6.10c.

ZINC

In the last week demand has been only moderate, but prices have remained steady or slightly higher. Prime

Western for early delivery is quoted at 7.40c., St. Louis, or 7.75c., New York, with November and December delivery about five points higher, respectively. Sellers are not pressing the market and are firm in their ideas of value. Neither are consumers eager to purchase. Dealers have been fair buyers. The effect of the steel strike is still strong but its actual termination will be an incentive to the market, it is believed. There is very little export business.

TIN

The market has been quiet the past week. The main feature has been the re-selling of prompt and nearby delivery metal by large consumers, who because of the steel strike have no immediate use for it. As they sold, however, they at once entered the market for future delivery tin. Not only the steel strike but heavy arrivals of the metal was another cause for this rather unusual procedure. By this selling and buying of future metal, these consumers not only saved storage and interest charges, but turned a profit on their sales and saved a substantial margin on their new purchases. The tin involved on those sales was mostly Straits and amounted to 200 to 300 tons. Aside from this there has been very little doing. Arrivals of tin thus far in October have been 4105 tons, of which only 100 tons have come in at Pacific ports. There are 5220 tons reported afloat. The London market for spot Straits tin yesterday was £281 15s. per ton.

ANTIMONY

Conditions and prices are unchanged at 8.50 to 8.75c., New York, duty paid, for wholesale lots for early delivery.

ALUMINUM

No. 1 virgin metal, 98 to 99% pure, is obtainable in wholesale lots for early delivery at 32 to 33c., New York.

ORES

Tungsten: No business has been reported in the last week and, with present conditions in the steel industry and the tariff question unsettled, there is little prospect of any.

Molybdenum: Conditions are unchanged with demand very light and quotations nominal at about 75c. per pound of MoS₂ in regular concentrates.

Manganese: There have been no important developments in the market. Quotations are nominal at 50c. per unit.

Manganese-Iron Alloys: The ferro-manganese market is quiet with British producers quoting from \$100 to \$110 per ton, seaboard, and American producers about \$110, delivered. About 9000 tons of spiegeleisen has been sold for export at around \$33 per ton or less. The nominal price for domestic delivery is \$35, furnace.

The figures of metal stocks held by the British government on October 1 are significant. Copper holdings of 51,000,000 lb. were almost 20% less than on the first of the previous month, and in all probability actual salable metal was much less, for a large proportion of the apparent copper surplus represents metal sold but not delivered. There is no question but England's surplus of copper is on the decline. British buyers must soon begin to cover. That they have already begun to do so is evidenced by the recent sale of a large tonnage of electrolytic for export at 22c. per pound, New York docks. The buyers were Englishmen who bought for immediate consumption. In the face of an adverse exchange situation, demand for export copper has been showing a marked and unexpected improvement during the past few weeks.

Marcy Mills are helping to put the Afterthought Plant on a paying basis

FLOW-SHEET of the AFTERTHOUGHT MILL

In an article in the August 2 issue of the Mining and Scientific Press, Mr. A. H. Heller describes the success which has finally attended the work at the Afterthought Copper Company, Ingot, Cal., in treating a very difficult and complex copper-iron-zinc ore.

Not least among the factors contributing to the success of the Horwood Process at this plant are the two six-foot Marcy Ball Mills.

These take a two-inch feed from the crushers and, working in closed circuit with Dorr Classifiers, reduce the pulp to flotation-feed.

Each mill is belt-driven by a 100-Hp. motor, the actual power required being 68, and handles 160 tons of crusher-product per day.

Five-inch, forged "Adamantine" chrome-steel balls are used.

A copy of the flow-sheet of the Afterthought plant and a booklet, "Crushing in One Easy Step with the Marcy Ball Mill," will be sent upon request. Just write, giving details of the character of your grinding conditions. Marcy engineers gladly co-operate with you.

The Mine & Smelter Supply Company

DENVER SALT LAKE CITY EL PASO
NEW YORK CITY: 42 Broadway

IN regard to the examination of claims for compensation under the War Minerals Relief Act, we understand that the Commission is doing all it can to expedite matters. So far 400 claims, out of 1200, have been decided. Precedence is given partly in the order of filing and partly in recognition of the need of the claimant, in accord with the information available.

EUROPE'S after-war necessities are indicated by the enormous expansion of our trade with the neutral countries and Belgium. During the first eight months of this year we have sold merchandise valued at 807 million dollars to them, or five times the amount recorded for the corresponding period of 1914. Belgium has received materials of food and reconstruction, partly financed by acceptances sold at New York, valued at \$260,000,000, as against a trade of \$40,000,000 before the War.

SENATOR HENDERSON'S resolution for dispensing with assessment work on mineral claims has not yet been reported from committee, and, we regret to say, there is considerable opposition to its passage without amendment by the Senate. We referred to this important matter in our 'Mining Summary' last week, explaining that it is proposed to limit the exemption from assessment work to five claims. This means that any individual or corporation claiming exemption upon five claims in which he or it holds an interest, no matter how small, is barred from claiming similar exemption from assessment work on any other claims that he or it may own in full or in part.

UNDER 'Discussion' we publish this week a number of interesting letters. The long one by Mr. R. B. Brinsmade will be read with interest by those who are awake to the importance of industrial economics, for Mr. Brinsmade has read carefully and observed thoughtfully. The steel strike and its origin are discussed by Mr. J. T. Owens, who finds something to commend and something to condemn in Judge Gary's attitude toward the strikers. Mr. T. Skewes-Saunders, general manager for the Compania Las Dos Estrellas in the El Oro district, Mexico, supports Dr. Keith and Mr. Philip Argall in their attack on the Crowe patent for vacuum precipitation from cyanide solutions. He is supported by Mr. Arthur Feust, of New York. From Chile comes a letter on the strengthening of the roofs of reverberatory furnaces, from Mr.

Samuel Fischer, who is smelter superintendent to the Compania de Minas de Cobre de Gatico.

WE are informed on the highest authority that King Albert of Belgium went away from San Francisco disappointed. He was received with respect and admiration, and oratory, during his recent visit to our city, but, much as he appreciated the speeches of the Mayor and the Governor, and the charm of their hospitality, he would have liked to make the acquaintance of those of higher rank, of whom he had read in our extremely well-informed daily press. For instance, he would have liked to meet "the fish king," Signor A. Paladini, and "the crab king," Signor Francisco Fusco, gentlemen apparently of the *haute noblesse* of this community. His disappointment did not end here, for he had heard of a Japanese gentleman called "the potato king" and he surmised that there must be a gentle Swede somewhere in the Sacramento valley answering to the title of 'the prince of asparagus'. Although we have no 'coal barons' in California, we have a whole peerage in oil and we have reason, like King Albert, to believe that the members of it are fit for the very best of regal society. Certainly we have at least one recognized "copper king" and other magnates, including "the czar of ragtime," who have been prominent in our newspapers recently. This illustrious group, representing our industrial aristocracy, would have interested the King greatly, for his experience in potentates has been limited to a few effete, and now discarded, rulers in Europe. Moreover, when King Albert read, in the 'Bulletin', about the "supermen" at the University of California he was more chagrined, we are informed, than he cared to say, that he should not have had an opportunity to see them. Five supermen have been discovered, so says the 'Bulletin', by Professor Kleeberger, who declares that "they surpass in physical perfection the great God Apollo and in masculine beauty the lovely Adonis." King Albert, not unnaturally, asked why his time had been wasted on the Yosemite or even in looking at the view from the Twin Peaks with Mayor Rolph in a plug hat in the immediate foreground.

MINING and industrial companies have made great strides during the last decade in the way of caring for their employees, but it has remained for the International Nickel Company of Canada to introduce a new departure, in the form of three annual scholarships for

a complete four years' course leading to a degree in science in the universities of Toronto, Queen's, or McGill. The scholarships, which cover all expenses while attending the chosen university, are awarded on the result of competitive examinations among the minor apprentices and sons of employees in the mining and smelting division, which has its headquarters at Copper Cliff, Ontario. The first of the annual examinations has already been held, so that the successful candidates may take advantage of the coming academic year. It will be observed that after the fourth year the company will be paying the expenses of 12 students continuously. So far as we know, this gift is unique, but it is the sort of thing we should have expected from the International Nickel Company, which has already blazed an honorable trail for notably generous dealings with its employees and to increase their well-being. The effect of this gift upon the ambitions of its workmen will be great, but we venture to suggest that the effect upon the mining profession may be even greater. Many of the finest miners and smeltermen we have today were recruited from the ranks of what, for a better term, are often called 'practical' men. The 'school of hard knocks' develops character of a kind that is often denied those whose earlier years are surrounded by more luxury and less industry. Young men who have toiled hard for their living and who know the disadvantages of lack of training, upon winning a scholarship of this kind will take up their technical course with a full understanding of its benefits, an ability to correlate theory and practice, and an energy that will not let slip any opportunity for acquiring a thorough knowledge of their work. We would advise those that tread the softer path to 'watch their steps'; it is probable that in a few years these lusty young sons of the stope and the blast-furnace will be looming large in the mining profession.

The Industrial Conference

The failure of the National Conference is little short of a calamity, and Secretary Lane's plaintive letter to the President asking for a new one shows that the Administration at Washington recognizes the seriousness of the failure. The reasons for the miscarriage of a good purpose are fairly obvious. In the first place, no agenda or program had been prepared, so that there was nothing to steer the conference away from the rocks of bitter controversy on which it suffered shipwreck. Next, its personnel was ill chosen. It was a mistake to include Mr. Elbert H. Gary among the representatives of the public, or, indeed, to afford the facilities for a prompt altercation between him and Mr. Samuel Gompers. Moreover, although organized labor was well represented, the larger mass of unorganized labor, including the professions, was not represented at all. The Conference became little more than an arena for debating the chief issue involved in the steel strike, namely, 'the closed shop' and 'the open shop'. Judge Gary was utterly uncompromising, and many will sympathize with him in his attitude, but it is

quite evident that his treatment of the controversy is likely to drive Mr. Gompers, as the wise leader of the reasonable and law-abiding elements of labor, into the arms of the radicals and anti-social group, represented by such men as Fitzpatrick and Foster, at the head of the steel strike, or Nolan and Bagley, who are at the head of the outlawed pressmen's union in New York. This is no time for antagonizing needlessly the truly American party in the ranks of labor as against the unruly alien party that is endeavoring to subvert our social structure. There is too much talk of "rights"; too much reactionary sentiment. All the "rights" that a citizen has are his by consent of the community as crystallized into law; with every "right" goes a corresponding responsibility to safeguard the welfare of the community. The vendetta between employer and employee—or capital and labor, if you please—is worse than a damnable nuisance, for it is waged in defiance of the obligation, owed alike by the employer and by the employee, to conduct his affairs so that the community does not suffer. Some of the employers are to blame; they are too plainly bent upon exploiting labor as if it were a mere commodity, not a human aggregate, but at this moment the public is bound to see that this feature of the struggle, while not negligible, is quite secondary to the outstanding fact that the radical faction is bent upon provoking revolution. Judge Gary is not intimidated by the prospect. As Mr. Lane says in his letter to the President, "Recklessness is in our blood, a great willingness to take risks that we have no right to take." Individuals or groups of individuals may take risks for themselves, but they are not warranted in risking the welfare of the nation in the course of their antagonism toward each other. Organized labor, after all, is not the whole show. Of the total labor in the United States, not one-sixth is organized; perhaps it were better if it were all organized, for then it would be less a class affair, because one kind of labor employs another and the class distinction would be impaired, as it ought to be. Judge Gary is an able man and the U. S. Steel Corporation is a splendid organization, but he and it are of minor importance as compared with the whole United States. The parties in conflict must adjust their difficulties within legal limits and without jeopardizing the welfare of the entire country. As against the breaking of the law, there must be no compromise, but in the adjustment, in a peaceable way, of the "rights" of this or that individual or group of individuals, there must be a compromise of conflicting interests, in order to protect the larger part of the population outside the quarrel. All our social conventions are the result of such compromise; only a savage fights for his rights regardless of those around him; the civilized man recognizes his responsibility toward society as a whole. The Conference ought to have set a good example, instead of furnishing another bad one. We hope that Mr. Lane's suggestion to call another conference, composed of representative public men, will be adopted and that some of our best men will apply themselves officially to the problem of adjusting these industrial disputes on an equitable basis.

The Leasing Bill

Good progress is being made with the Mineral Land Leasing Bill. It has been returned, with some forty amendments, by the Committee on Public Lands to the House of Representatives, which will now pass upon it, before returning it to the Senate. The Bill might be called the Oil-land Leasing Bill, for it concerns the oil-lands of California and Wyoming more particularly, being designed to quiet the long-drawn out controversy over the tracts withdrawn by the Government, partly as reserves of oil for the Navy. It has been claimed that 750 million barrels of oil have been held back in consequence of the withdrawal order issued by President Taft. In Wyoming the Bill affects 1,131,300 acres, mostly in the Salt Creek field. In California the leasing bill is not altogether acceptable, because many of the operators believe that they have rights more specific than a lease, but most of them will be glad to get rid of an expensive litigation and acquire better title than is probable under existing conditions. The Bill relates to "the mining of coal, phosphate, oil, gas, and sodium on public domain." It will affect the phosphate industry considerably, for the lands involved are said to contain some twenty million tons of phosphate. The efforts to promote the enactment of a leasing bill started soon after President Wilson's first term began, six years ago. Both the President and Secretary Lane have been credited with a desire to hasten the relief enactments for opening the lands under dispute, and it is possible that favorable legislation would have ensued much earlier if the Supreme Court had not decided against the oil-claimants in the Mid-West case in 1915. A bill was introduced in the last session of Congress and it seemed likely to pass when Senator La Follette talked it out. The present bill provides that the holders of productive wells on the naval reserves shall be given leases "with an area of land sufficient for the operation thereof" and that "the President may, at his discretion, lease the remainder of any such claim upon which wells have been drilled, and in the event of such leasing said claimant or his successor shall have a preferential right to lease." It is stipulated specifically that no claimant "who has been guilty of any fraud or who had knowledge or reasonable grounds to know of any fraud, or who has not acted honestly, and in good faith, shall be entitled to any of these benefits." This leaves plenty of scope for further litigation, for the honesty of the locations is the chief issue in many of the lawsuits now pending. If the holder of ground upon land covered by the withdrawal order of September 27, 1909, but not within any naval petroleum reserve, will relinquish his claim, and if he will pay to the Government "an amount equal to the value at the time of production of one-eighth of all the oil or gas already produced and saved from such land," then he will be entitled to a lease for a period of 20 years, "at a royalty of not less than 12½% nor more than 25% of all the oil or gas produced and saved." Other unappropriated oil-lands may be leased to the highest bidder in areas not exceeding 640

acres, such leases being conditioned upon the payment by the lessee of a bonus together with a royalty of 12½% per annum and a rental of \$1 per acre per annum. We need not go into further details, because the Bill will be subjected to many changes before it is passed. When this is done, we shall publish the full text of the Act.

The Threatened Coal Strike

The President's pronouncement, insisting that the order for a general strike in the bituminous coalfields be recalled by the United Mine Workers of America, will give keen satisfaction to every good citizen. This step was taken none too soon by the Chief Executive; it will serve to crystallize public opinion. The intention of a small number of men to "paralyze the industry of the country" in order to enforce their excessive demands for increased pay and shorter hours constituted "a grave moral and legal wrong against the Government and the people of the United States." The strikes already declared, and in force, have crippled the industries of this country at a time when every consideration, economic and humane, calls for increased productivity. It is evident to any intelligent observer of current events that at this moment there is being waged a conflict not so much between employers and employees in various areas of industrial turbulence as a contest between the law-abiding labor leaders and the lawless ones, between the labor element that is honestly and properly endeavoring to better conditions of life and of employment and the anarchistic element that is trying to introduce the ideas of the soviet and of bolshevism into the United States. A concerted effort is being made not by genuine laboring men but by groups of reckless revolutionists, all over the country, to impose their anti-social notions upon American industry. The steel strike, the press-men's strike, the longshoremen's strike, the threatened coal strike, the threatened railroad strike—these are portentous not only because they synchronize, and therefore cause much damage and distress, but because they indicate an attempt to seize society by the throat and compel it to surrender to the illogical and unreasonable demands of an unruly and lawless mob, largely composed of aliens. The coal strike is "a fundamental attack, which is wrong both morally and legally, upon the rights of society and upon the welfare of the nation." So says the President; and it is high time he said it. The function of government is to govern. The public has suffered enough from the cat-and-dog fight between capital and labor in total disregard of the general welfare. This coal strike, declared for November 1, is illegal because it disregards an agreement on wages between the coal companies and the coal miners that was made with the sanction of the United States Fuel Administration, and that runs during the continuance of the War, but not beyond April 1, 1920. The war is not yet ended, for peace has not been declared; therefore the coal miners are still bound by their agreement, but, like other unions, the United Mine Workers are treating their contract as a scrap of paper. The

strike is morally wrong because it is being started at a season when it will cause the maximum of suffering to the population, particularly to those least able to provide in advance for their domestic supply of fuel. Congress and the people will support the President and the Administration in this hour of national crisis. We can join, in the words of the resolution proposed by Senator Charles S. Thomas before the Senate, "in giving the national administration, and all others in authority, the assurance of our constant, continuous, and unqualified support in the great emergency confronting us, and call upon them to vindicate the majesty and power of the Government in enforcing obedience to and respect for the Constitution and laws, and in fully protecting every citizen in the maintenance and exercise of his lawful rights and the observance of his lawful obligations."

The Press-Men's Strike in New York

In consequence of the 'pied' condition of the New York printing trade, our contemporary, the 'Engineering and Mining Journal', has been endeavoring to arrange for printing its issues in San Francisco. It is stated that 153 magazines and 300 trade papers and other periodical publications are affected by the strike of press-men, feeders, and compositors in New York. The deplorable conditions now obtaining are due to an internal fight among the unions, and not to anything done by the publishers. Two press-men employed by the Publishers Printing Company were expelled from a local union because they retained their membership in the international union, called the International Printing, Pressmen, and Assistants Union, with which the local union was affiliated. The word 'international' refers to Canada, not to Europe. The local union demanded that the company discharge the two international men; in other words, the local union, although affiliated with the international, was fighting it. Thus the publishers were between two fires. They decided to stand by the international union, which is the more responsible, whereupon the local unions declared a strike, in violation of their contracts with the publishers and in disregard of the orders of the international union, which has now outlawed them. New unions are being formed, within the jurisdiction of the international. The printers, regarding the demands of the local unions as irregular, have closed their establishments, so that fully 7000 men in the printing industry are out of work. Disciplinary control on the part of the international has failed in preventing members of the typographical union, or compositors, despite a vote opposing the strike, from taking a holiday, that is, quitting work. The result is chaos. New York is already paying higher wages than other cities, and unfortunately the concentration of publishing businesses in New York has tended to aggravate the adverse conditions by causing a shortage of the special kind of labor required. A diversion of the printing business to other cities near-by has already begun and the present strike undoubtedly will lead to a wider distribution, for many cities are bidding

for the patronage of the New York publishers, who will go far afield rather than expose themselves to another experience such as the one they are now undergoing. The zone postal-rates may be another factor in favor of printing papers and magazines of national scope nearer the centre of circulation; likewise the comparatively poor track facilities available in New York for the delivery of paper from the railroad-cars to the printing-plants. It seems certain therefore that important changes are impending. The public, we feel sure, will show their sympathy with the New York publishers by not standing too rigidly on their legal rights as subscribers, and we have no doubt that the advertisers likewise will take such steps as will minimize the loss entailed on the magazines and trade publications by circumstances beyond their control. They are the victims of labor anarchy, not of legitimate unionism.

General interest has been aroused by the method used by the 'Literary Digest' to obviate the difficulties arising from the printers' strike in New York, by photographing the typewritten copy and reproducing it by photo-engraving on zinc-surfaced blocks. In order to do this the manuscript has to be copied by expert typists on the best typewriting machines, so as to ensure perfect alignment. The typewritten sheets used are longer and wider than the column of the magazine in order to permit reduction; they are pasted upon large sheets of cardboard before being photographed; the process engraver then reproduces them by etching on zinc, the blocks being exactly the size required to fit a column. The time consumed between sending the finished copy from the editorial rooms and delivery of the zinc blocks to the printer averages nine hours. Before these operations are started, it is necessary that the original manuscript be carefully typewritten and corrected, for no corrections can be made in the later stages of the process except at excessive cost and loss of time. The experiment is interesting, but, of course, this method has been used before; indeed, it is not at all uncommon to photograph and engrave the pages of a book rather than re-set the type, and our readers will have seen tabulated statements of statistics that we have reproduced by this method, largely to avoid the chances of error incidental to setting a complicated series of figures in type in our own composing-room. The cost of the method used by the 'Literary Digest' is nearly twice that of ordinary type-setting and printing, and for that reason it has not been adopted in the business of publishing. The 'Literary Digest' has shown enterprise and has won a wide advertisement by its adoption of this means for circumventing the striking compositors of New York, but there is no reason for believing that the method will come into general use. The result is not satisfactory, apart from its costliness, because the typewritten words are not as well defined as those set in type. Nobody would prefer to read the pages of a magazine such as the publishers of the 'Literary Digest' are now issuing in preference to the clean clear-cut typography resulting from the conventional processes; and the strikers, of course, are well aware of the fact.

Mr. Ingalls and Walkerian Economics

The Editor:

Sir—In his presidential address¹ entitled 'The Economic Duties of the Engineer', delivered last January before the Mining and Metallurgical Society, Mr. Ingalls made the following statements: "One of the greatest of economic laws is that of the survival of the fittest, which exhibits itself in competition, and from that is derived the classic economic doctrine that labor is the residual claimant upon the produce of industry. After the shares of the State, the landlord, the capitalist, and the *entrepreneur* have been deducted, all the rest goes to labor, and here is what is mystifying to many, to wit, rent, interest, and profits are limited by competition, and of them the laborer can get neither the share of the landlord nor of the *entrepreneur* by any economic means, while, as for interest, the residual claimant . . . is better off when a high rate of interest is being paid than when a low rate is paid. . . . The inequality in the distribution of wealth is not between the capitalist and the laborer, but rather is it among the laborers themselves. . . . This is no preaching of capitalism as commonly understood, but is simply classic and proved economic doctrine."

As Mr. Ingalls in this address failed to give his authority for his "proved economic doctrine" I fancied him merely floundering beyond his depth in an unfamiliar subject and that his fallacies were so glaring that he would soon be set right by some wiser friend. But my hope was disappointed, for nearly a half year later he addresses the Canadian Mining Institute on 'Industrial Co-operation'² and voices the same fallacies as before. And though this time you sharply criticize his address in a short editorial³, I believe the subject important enough to warrant some further remarks.

Before scrutinizing Mr. Ingalls' statistics, I beg leave to dissect his "classic economic doctrine" for if that be proved, as he claims, little can be argued against the truth of his resulting theory of industrial relations however repugnant the latter may be to our democratic sentiments. As his doctrine concerns the primary equation between the production and distribution of wealth it can be reduced to its simplest terms in the Trinitarian diagram in the next column.

This diagram signifies that the three essential factors of production—land, labor, and capital—unite to produce

wealth, which thereafter is distributed among the three factors, labor receiving the wages, capital the interest, and land the rent. Taking these seven terms in their strict economic sense⁴ we find that Mr. Ingalls mentions

two more productive factors—the *entrepreneur* and the State—and two more distributive items—profits and taxes. It is clear, however, that the *entrepreneur* is merely one class of mental laborer, while the State is a silent partner in all productive enterprises as it furnishes more or less of its land, its capital, and its labor to assist every one. Accordingly taxes may be classed in turn under the headings of wages, interest, or rent as they represent a payment made for the use of the labor, the capital, or the land of the State. Profits likewise cannot correctly be considered as a simple item of distribution, but should be classed as wages when due to the labor of the *entrepreneur*, as interest when due to the use of capital, and as rent when due to the natural surplus yield of land.

Though Mr. Ingalls at the beginning of his free quotation from General Walker⁵ makes some correct deductions, as to rent and prices, from Ricardo's 'Law of Rent',⁶ he completely misses its meaning when he remarks:

"It [rent] must go to the landlord unless it be confiscated by the State or ravished away by violence, and in

⁴J. E. Symes in Chap. I and II of his 'Political Economy' thus defines these terms: "Land includes such material gifts of nature as can be monopolized; labor includes all manual and mental human exertions used to produce wealth; capital includes such material products of labor as are devoted to the production of other objects of desire; wealth includes all the material products of human labor which arouse desire. Assuming free competitive conditions and wage in the share of wealth secured by laborers, interest is the share secured by capitalists, and rent is the share secured by the proprietors of natural objects and forces."

⁵'M. & S. P.', June 28, 1919, p. 877.

⁶Syme's 'Political Economy', p. 29, gives "The normal rent of any land is got by deducting the produce of land on the margin of cultivation from the produce of the land in question."

¹'M. & S. P.', February 8, 1919, p. 190.

²'M. & S. P.', June 28, 1919, p. 877.

³'M. & S. P.', June 28, 1919, p. 869.

either of these events it will soon cease and no longer accrue for anybody."

For it is evident that it makes no economic differences at all to the tenant whether he pays his rent to a private person (landlord) or to the State, nor does he care whether his rent is called a 'voluntary offering' or a ravishment by violence, provided it has to be paid in either case. Ricardo's theory therefore implies nothing of Mr. Ingalls' assertion that rent will cease when collected by the State as landlord; and the practical facts also contradict Mr. Ingalls as is proved by the large annual sums received by many governments from the lease of their public lands.⁷

Mr. Ingalls' next assertion that "profits economically partake of the nature of rents" is just one-third of the truth, for I have already shown that 'profits' may be correctly classified under interest or wages quite as often as under rent. And how misleading a third-truth may be is demonstrated when he further remarks: "Just as there is a class of no-rent lands, so is there a class of no-profit employers, the need for whose produce determines the market-price. From the point of no-profit production, profits range upward through the degrees of moderate profits, liberal profits, grand profits, monumental profits, but these consist wholly of wealth created by the *entrepreneurs* themselves and no economic means would carry any portion of them permanently to wages. To be sure, they may be taken by the State as taxes, and by the State paid out in extravagant wages, but this destroys the economic balance and produces conditions whereof the result is that nobody makes any profit, industry languishes, and labor suffers."

Where 'profits' is synonymous with rent, the first sentence of this quotation is quite true. But the next sentence, where it is claimed that all larger rates of profit consist of wealth created wholly by the *entrepreneur*, is sheer nonsense, because such profits may as often be due to superior land or capital as to the ability of the directing labor. The diversion of large profits from the owners to the State by taxes, to be later paid out in high wages, would only make the industry languish when it discouraged the exercise of ability or the further investment of capital. Where the operation represented merely a transfer of rent from the landlord to laborers, it would have no such effect, for the former in his function as titleholder of raw natural resources is, economically, merely a parasite on production.

As a sort of seidlitz powder designed to clear up for himself—if not for his audience—this muddle of fact and fancy based on an incomplete conception of the term 'profits', Mr. Ingalls now proceeds to give some elementary instruction as to the difference between real and apparent profits, with an apt illustration drawn from his wide experience in zinc enterprises. This he does before attempting his theoretical *chef d'oeuvre*—guaranteed, if accepted, to make the world safe for plutocracy—in the following astounding quotation from General Walker:

"Rents, interest, profits, and taxes being deducted from the produce of industry, all the rest goes to the laborers. 'So far as, by their energy in work, their economy in the use of materials, or their care in dealing with the finished product, the value of that product is increased, that increase goes to them by purely natural laws, provided competition be full and free. Every invention in mechanics, every discovery in the chemical arts, inures directly and immediately to their benefit, except so far as a limited monopoly may be created by law for the encouragement of invention and discovery.'"

By referring again to the Trinitarian diagram we can easily see that, as land, labor, and capital share among themselves the whole output of wealth, the share of one of the three productive factors in the output of any enterprise can only be increased at the expense of one or both of the other two. Also the share of wealth which one factor can obtain depends entirely on its relative strength in its struggle with the other two factors. As productive operations grow in size, it is evident that any one of the three factors which can be indefinitely increased in quantity is subject to competition, and consequently its share of wealth tends to be cut down to the minimum necessary for the factor's survival. As both labor and capital are of this competitive nature, wages tend constantly to approach the minimum of the lowest wage necessary to keep up a labor supply of the required quality, and interest tends to approach the minimum rate necessary to encourage the saving of sufficient capital. Land, on the contrary, being fixed in quantity, cannot be increased as production grows; it is therefore the only monopolistic factor of the three. Hence property in land is a legalized monopoly and a perpetual one, too, while property in patent rights—the only kind of monopoly Mr. Ingalls has been able to discover—is temporary. The final result of the competitive struggle between land, labor, and capital is that the monopolistic factor—land—takes the whole residue of wealth from any operation after labor and capital have been paid their living wages. Thus land and not labor is the residual legatee of industry, and to supplement this simple *a priori* proof I have no less an authority than the greatest British economist, John Stuart Mill, who says⁸: "The economic progress of a society formed by landowners, capitalists, and laborers tends to the progressive enrichment of the landowners."

In sciences like political economy, whose phenomena are so widely extended that a theory can seldom be proved on a laboratory scale, the selection of a special case, involving only the factors pertinent to the problem in question, is often both legitimate and sufficient. But for such an illustration to be scientific it must be in harmony with existing facts, and the example next quoted by Mr. Ingalls does not satisfy this criterion. It would be impossible for the same laborers to increase their output by 5% over-night; likewise if a different set of more productive laborers were substituted, as is proposed, it would normally imply only a more expensive training, and the 5% extra output which they secured as wages

⁷Minnesota receives about a million dollars annually as rent from the leased State iron-ore lands.

⁸'Political Economy', book on 'Land'.

would represent the interest on the capital cost of this training. The illustration shows that skilled labor can get more wages than unskilled labor, because it costs more to produce the former, but it quite fails to prove that labor is the residual legatee of industry.

As Ricardo's 'Law of Rent' (expressed graphically in the Trinitarian diagram) shows that private legal monopoly originates in unrestricted land ownership, it is highly disturbing to an organized plutocracy which fears its political effect on its fellow citizens. Yet there is no cause for alarm as long as the latter can be as successfully camouflaged as Mr. Ingalls has evidently been by General Walker, whose reactionary economic school includes many American college professors and such European writers as Say, Mangolt, Herman, Goschen, and Mallock. This school brazenly befores the truth by declaring that "the rent of land is not a thing by itself but is the leading species of a larger genus;" it affirms that differential productive advantages are not peculiar to landowners but are also possessed by capital owners and laborers with unusual ability. On this basis, the wages of ability and the interest of capital are analogous to land rent, so all three can be lumped together, when desirable, and called 'profits'. Thus is confusion worse confounded and land monopoly so safely denatured, that the consequent erudite dissertations of the 'experts' in political economy become as pleasing to our modern plutocrats and their dupes as were ever the involved diagrams of Ptolemaic astronomy to the medieval monks.

So much for Mr. Ingalls' theories—now for his statistics! Here, while he modestly disclaims any knowledge of the exact figures, he does not hesitate to found upon his surmises the most dogmatic and wildest generalizations as to prevailing economic conditions. In January he thinks labor gets 80% of the nation's income but in June he discovers Dr. Bowley's figure of 60% for Great Britain and, unabashed, remarks:

"Numerous studies of both Great Britain and the United States show that of the whole produce 60 to 80% goes to labor and that the remainder is but a relatively small return on the capital used. But we are able to show and to say a good deal more than that, to wit, that during the last hundred years of great industrial development the *major part of the benefit* has accrued to labor."

Laying aside for the moment the slight discrepancy of ten billion dollars—or \$100 per capita—between the 60 and 80% figures for labor's share of income, let us consider the 'small return on the capital used' which elsewhere⁹ Mr. Ingalls estimates to average 4% annually. Yet any such return affords no explanation whatever of everyday financial phenomena. Can it explain how our hundreds of 'self-made' millionaires have risen from poverty to a plethora of wealth within two or three decades? For a sum to double itself at 4% requires 18 years; and if a man saved \$10,000 a year it would be 41 years before his fortune, accumulating at compound interest, would reach one million, much less the many mil-

lions which scores of our compatriots have accumulated by middle age. No! neither compound interest at 4% nor a high salary and a saving disposition can account for huge private fortunes; no more can Walkerian economics. Yet what is impossible for blatant empiricism is often easily achieved by science, and so it is here, for the Trinitarian diagram explains the problem quite simply.

Of the two productive property factors of the diagram, the one, *capital*, is competitive and its reward—interest—tends to a minimum, which meant a rate of $3\frac{1}{2}\%$ annually in the London money market before the Great War; the other, *land*, is monopolistic and its reward—rent—has no upper limit except its surplus yield, or differential advantage, above that possessed by land at the margin of production. Moreover, since the value of property is computed by capitalizing its annual yield at the current rate of interest, the selling or market value of landed property has no relation whatever to the labor or capital expended in its development but is simply the sum obtained by capitalizing its rent. Therefore the owners of our richer lands constantly receive large sums as rent which represent no original investment of either labor or capital, and wherever they have obtained their land titles from the Government at little or no cost to themselves—as has been feasible in the case of our public lands—they have rapidly been enabled to get rich without working. Such rewards from the ownership of monopolistic property are called 'unearned increments' and they furnish the only means for validating 'watered' stocks. The temporary legal monopoly conveyed by the patent rights for invention also give rise to similar increments, but these privileges are plausibly supposed to—and really would if the law were perfected—merely grant a proper reward to inventors for their services to society. All other enterprises, beyond those based on land or patent-right ownership, are outside the law when they attempt to secure monopoly profits, and it is safe to say that none can long do so when not in close alliance with one or both of the two legal classes of monopoly.

In order to show how far the existing facts of industry differ from Mr. Ingalls' 4% 'statistics', I will cite a few examples of the enormous unearned gains accruing to certain lucky owners of land, taking up in turn the five varieties, namely, agricultural, timber, mineral, townsite, and public-utility, and considering only the value of the lands themselves apart from their improvements or betterments.

The value per acre of rich agricultural land reaches only moderate figures, but its total area is so large for the United States that both its aggregate value and the unearned increment this represents is enormous. As long as fertile accessible lands could be had for the asking from the Government, farms remained cheap; when this happy condition passed in the 'nineties the pressure of our increasing population caused a rapid rise in land value. This advance has been especially noticeable in the Middle West, where the small towns are filled with retired farmers living on their rents or on the income derived from the sale of their farms. Kansas and Nebraska

⁹M. & S. P., February 8, 1919, p. 190.

lands that went begging at \$10 to \$20 per acre in 1890 now bring from \$50 to \$100, while Illinois lands, then considered dear at \$50, now readily sell for \$200 per acre. It is safe to predict that if our present land system continues, the best land will soon be selling at \$400 to \$500 per acre as in Belgium.¹⁰ In 1900 the total value of our farm lands was 13 billions, ten years later this had advanced to 28½ billions, or 118%, while the increase in area was proportionately small.¹⁰

In 1870 the country's forests were 75% publicly owned, in 1910 about 80% had become private property.¹¹ The richest forests on the globe are those of the Pacific North-West and those not given away to railroad promoters were mostly sold at \$2.50 per acre under the Timber and Stone Act. Passed ostensibly as an aid to settlers, the net result of the latter act was a loss to the nation of 12,000,000 acres of forest, of which 80% has been transferred by the 'settlers' directly to speculators. Lands reasonably worth 240 millions at the date of sale were ceded for 30 millions or an instantaneous profit for the speculators of 700%. Our second-best forests are the Southern pine of the Gulf States, and these were sold by the Government at \$1.25 in the three decades following the Civil War. These pine lands now sell at \$50 per acre, equivalent to an increase of 4000% in 40 years.

Like our rich soils and wild forests of big trees, our superior mineral deposits are a gift of Nature to the nation; nevertheless they have been likewise given away, for little or nothing, to first-comers. Perhaps the most remarkable example of the resulting gain for industrial parasites occurs on the Mesabi range, which was, thirty years ago, a primeval forest selling for its timber at \$1 per acre. In 1890 the first of the great bodies of rich iron ore—shallow, soft, and cheaply-mined—was discovered, and many such are now known to occur at intervals along a strip 100 miles long and ¼ to 2 miles wide. In most cases, the landlords here do no mining at all, for the leasing companies explore the ground gratis with diamond-drills, and then pay a royalty of 15 to 50 cents per ton on all the ore they extract. It is not uncommon for a 40-acre tract to yield 4,000,000 tons of ore on which the landlord collects a royalty of \$1,000,000 or 25,000 times his original investment of \$40, an increase of 2,500,000%. Of the profusely-watered stock of the U. S. Steel Corporation, amounting to nearly 1½ billions at par value, C. M. Schwab testified in 1901 that 700 millions represented the value of iron-ore properties. Of these 'properties', the bulk were undeveloped mineral lands on the Mesabi range.¹²

It is perhaps superfluous to dilate further on a subject so familiar to mining men, but for Mr. Ingalls' benefit I will quote a case of unearned increment here in Mexico. The well 'La Corona', of the Dutch Shell company in Panuco, produced 50,000 barrels of oil daily on which a moderate estimate of net operating profit would be \$10,-

000. This amounted to over \$3,000,000 per year, or a gross profit in one year of 8000% on the \$37,500 cost of the well. These marvellous gushers often last several years, as instance the 'Casiano No. 7' of the Huasteca company which yielded, in the four years ended September 11, 1914, a total of 33,580,000 bbl. of oil and was then still spouting daily 20,000 bbl. of oil and 10,000,000 cu. ft. of gas.¹³

For townsite land, that of New York presents the most startling example of unearned increments. Bought in 1646 from the Indians for \$24.60, the island of Manhattan was assessed for taxation in 1914 at some three billions, or \$1240 per capita. As the corresponding assessment of improvement value was only 1½ billions, the townsite owners are evidently drawing double the income, from their paper titles, of what is received by the owners of all the capital which has been required to turn New York from a rocky barren island into the national metropolis. During 268 years the landlords have averaged an increase of \$450,000 for each dollar paid the Indians, or an annual rate of 45,000,000%.¹⁴

Though most public utilities are now in a bad way, owing to rising expenses and an income limited by law, this was not always so, for many a reigning financial magnate started his career as an impecunious franchise-grabber. Vast unearned increments have accrued to concessionaires of steam and street railroads and of pipe and wire lines. In many cases, the normal gain of the franchise monopoly has been augmented by huge bonuses of land—or even of cash—bestowed on the promoters by a dotting city, state, or nation. A well-known example is that of the Union Pacific railway whose four promoters were able to draw out, within 20 years, over 100 times their original investment of \$125,000—a gain of 500% annually.¹⁵

The quoted examples, however surprising, are not war-profits—they all happened before 'The Day'—nor are they sporadic, but the signs of a widespread social cancer. Five-ninths of our income property is not economic capital at all but "capitalized privilege or capitalized predation," declared H. J. Davenport in 1910.¹⁶ Disregarding Mr. Ingalls' estimates for our wealth and income—excessive even for the inflation of 1916—I shall assume 30 billions as a close approximation to our national income in 1913. Taking the British figure of 60% as the part paid to labor, and we have 18 billions to be divided among our total of 35 million wage-earners or an annual wage of \$515 per person.¹⁷ This is not far from the figure found by the U. S. Industrial Commission in 1915¹⁸ and agrees closely with the exact figures I have at hand for the

Southern lumber industry. Mr. Ingalls' estimate of \$1000, as the average wage for 1916, is absurdly high and quite lacks any valid foundation, for the wartime wages in steel-making offer no criterion of wage rates in general. After paying labor, there remained in 1913 an income for 'property' amounting to 12 billions, but at least half of this was not in any sense the interest of real capital but the unearned gain from land monopoly and similar forms of legal privilege or from illegal predation.

Evidently blind to these everyday facts, Mr. Ingalls blithely continues to dogmatize as follows:

"I have shown, I hope, that there cannot be anything essentially wrong in the existing system of the distribution of the produce of industry as between labor and capital. Labor cannot divide among itself any more than there is to divide, that is, the total of what is produced. That is self-evident [sic!]. It may attempt to seize the modest share of capital but, if it succeeds in doing so, that share dries up. If it confiscates capital itself it does not gain anything, for capital, without the directing minds to use it productively, ceases to be of advantage to anybody. . . . Why is it that while socialists are shouting from soap-boxes, inflaming the populace with irritant poisons, while doctrinaires [Prof. Davenport?] who hold professional chairs are issuing fallacies . . . we cannot drive into the heads of people that even as things are under the capitalistic system they get all they can . . . It is of profound importance to make the millions of workers see things correctly [through Walkerian glasses?] for they are blindly approaching a time when adverse economic conditions are going to drive them, and no socialistic ranting or paternalistic policies by the governments are going to help them . . . We have to contend with something quite similar and equally serious [as the fallacies of the workmen] in the minds of a large part of the employing class. This is the idea among thousands of them that they, too, do not get their due, that something is somehow stolen from them, in short, that they can get more than they produce. This idea finds expression in agrarian movements among the farmers to contest what they deem to be robbery by the millers and railways. It finds expression in the never-ending grievance of miners against the smelters. During the War the attitude of these people assumed the form of a rapacity that was only a little less extortionate than that of some classes of labor and which has a very ugly and dangerous aspect now."

After this sound berating from Mr. Ingalls' pedestal of economic and statistical wisdom, the working and employing classes ought to cease their clamors, but will they? Probably not, as long as 20% of our national income is going to industrial parasites! While they may be getting "all they can—as things are" perhaps the workers hope, with some show of reason, to alter those things a bit. The idea of the employers that "something is somehow stolen from them" seems to have rather a weighty foundation if we consider the mass of six billion metallic dollars.

In the past, fortunately for the monopolists, the most meddlesome labor leader could readily be cajoled into

silence by giving his organization a share of the social loot, while any disgruntled competitive employer could usually be diverted from his personal grievances by giving him a chance to share the 'divvy' by a flyer in grain or townlots or 'little steel'. Even when enough of the middle class resisted temptation and got together to launch a bark like the Populist party, it was easy to soon lure it to ruin on the rocks of practical politics. But the Great War seems to have cleared away these old obstacles to economic freedom, for we have now the British Labor party boldly proclaiming that "social wealth must be used for public purposes" and our own Non-Partisan League launching an effective campaign against the speculators in land and produce.¹⁹

While every land title is, theoretically, a special privilege, only a fraction of them will yield enough surplus, above the necessary rewards for the labor and capital utilized, to give them much of a social value. And even this select few can be depressed or deprived entirely of value if their way to market is controlled by some alien interest. This fact was known before the science of economics was even thought of, as many a ruined 'robber-baron' castle on the trade routes of Western Europe will testify. The profit of such practical wisdom is evidenced in our own day also by the career of such astute concerns as the Standard Oil,²⁰ the Beef Trust,²¹ and (perhaps) the Smelter Trust.

Some years ago I encountered in Santo Domingo a miniature example of this penning up of producers, which was so ideally plain as to have satisfied the most exacting economic textbook writer. Ingress to the interior from Samana bay was blocked by a swamp some 20 miles wide over which the only causeway was occupied exclusively by the railway from the port of Sanchez eastward.²² The Scotch owners of this line were canny enough to realize their unique position to a 'T' and, being unhampered by any public rate-making commission, they had fixed the freight rates for transporting goods to and from the rich lands of the Yuna valley, at just what the traffic would bear. As for passengers, they were charged about what a laborer could have earned in the time required to walk across the swamp on the ties of the causeway.

With much of what Mr. Ingalls suggests, in the balance of his long addresses, as to methods of increasing our output of wealth, I am in hearty accord, since on this non-political subject he dares to cast off his Walkerian blinders and speak freely from his well-trained mind and full experience. Yet near the end of his second speech he returns to the worship of plutocracy in the following words:

"What is, or ever was, the 'autoocracy of capital'? . . . Substitute the 'authority of the directing minds' and we shall come nearer to the truth . . . Heavier tax-

ation of rich men may have come to stay, but that in itself is going to be to the detriment of the men and women who contribute the labor that enters into production . . . The jargon 'industrial democracy' is simply an expression of the discredited theory of Karl Marx, repudiated by socialists themselves, who recognize in the words of Mallock, that 'in any complex system of industry, such as that which prevails today, the efficiency of the workers as a whole is the average efficiencies of the many multiplied by the efficiencies of the few,' the Few being 'the natural monopolists of ability,' whose function is to issue orders, while that of the Many is to execute them with strict obedience."

Besides the sentence regarding the taxation of the rich—which is only true when the tax falls on their earned wealth—Mr. Ingalls here confuses two quite distinct questions: ownership and organization. Few of the 'directing minds' of industry own the works they manage and most of them are, theoretically, just mental laborers. Discipline is a matter of organization, not of ownership, and is as well maintained in the plants of stock companies, with absentee shareholders, as in those where the owner, himself, acts as foreman. 'Industrial democracy' is not synonymous with socialism²³ and seems to be the goal toward which modern social progress is moving. Just as the autocracy and oligarchy of the Middle Ages have gradually been superseded by democracy in the State, so will the irresponsible despots of the early factory epoch be slowly overcome by the competition of co-operation in economic life. Even now purely co-operative²⁴ concerns—where the workers and consumers own *all* the capital—have captured a large part of the grocery business of England, and will gradually extend their activities to other industries as the workmen attain a higher average standard of education.

The issue thus is not between capital and labor or between the talented Few and the stupid Many, as Mr. Ingalls would have us believe. Rather is it capital and labor versus private monopoly—the producers against the parasites.²⁵ Then how imprudent it is for an advocate of Walkerian sophistry to throw stones at the rival school of Marx! Handicapped as Marx was by a near-sighted mind and a lack of industrial experience, he yet labored for years conscientiously, in self-sacrificing penury, trying to prove by statistics Proudhon's absurd theory that "all property is robbery". While even Marx finally found the key to the economic mystery of property,²⁶ General Walker never did, for his last important work was 'Land and Its Rent'—an even feebler attempt than the book²⁷ of his English coreligionary to refute Henry George's masterpiece, 'Progress and Poverty'.

The Value of Conference

The Editor:

Sir—In his remarks at the Chicago meeting of the Institute on "momentous social changes," Mr. Theodore W. Robinson said, as you report in your issue of October 11, that "Judge Gary recently declined to meet certain labor leaders because he rightfully did not feel that they were authorized to speak for a large number of employees, and because a conference with them would have been treated as a recognition of the 'closed shop' principle."

There is no one living who believes in the 'open shop' more firmly than I do; nevertheless, I cannot see any force in Judge Gary's argument. It is to me a typical example of the arbitrary action that has caused so many strikes. In the Colorado coal strike of 1913-'14 the same refusal was made by the operators. This went so far that at one time the representatives of the operators were in one room and the union leaders in an adjoining room, and yet no conference took place. We all know the savageness of the strike that followed. Very possibly the conference might not have stopped the strike, but there was a chance for arbitration that was refused.

Judge Gary was evidently mistaken on one point. He felt that the labor leaders did not speak for a large number of employees, but events showed that a very large number of employees came out on their orders.

The fear that a conference means a recognition of the 'closed shop' seems absurd, for it could have been stated plainly at the outset that the 'open shop' was the fixed principle of the company. Lloyd George's plan of having the labor leaders to luncheon seems a far better plan than to refuse a meeting. In such a conference there is always a chance of a better understanding. The labor leaders might be brought to see reason in the policy of the company and *vice versa*. For instance, the labor leaders object strenuously to the physical examination of employees, but a doctor in whom they have confidence might readily be able to prove to them that this examination is more in the interest of the employee and his fellows than in the interest of the company. An engineer with heart disease dying with his hand on the lever of a locomotive has caused a terrible wreck before now. And other physical defects might work serious injury to all concerned. Through physical examination defective men might be found work that would be least harmful to them and where they would not be a source of danger to their fellow-workmen.

I have consulted a number of my engineering friends on this question and we all feel that it was an error for Judge Gary to refuse to meet these labor leaders. At the same time we feel that Judge Gary deserves the highest admiration for standing firmly for the 'open shop,' for if this country ever comes entirely under the labor-unions we shall see a despotism as bad as the one that is now dying in Russia.

We do not feel that a conference with labor means

that a strike will not take place, but we do feel that it is a chance of avoiding a strike that ought not to be neglected.

J. T. OWENS.

San Francisco, October 13.

[Judge Gary refused to meet the leaders of the strike because they were agitators from the outside, not workmen on the company's payroll. However, the point is well taken; disputants rarely meet in conference without a softening of the asperity between them; they learn to see something of each other's point of view, and that way lies conciliation.—EDITOR.]

The Vacuum Process

The Editor:

Sir—Mr. Crowe's original article as read at the Colorado meeting in September 1918, dealing with the effect of oxygen upon the precipitation of metals from cyanide solutions, is written in such a manner as to create at once the impression that the so-called Crowe vacuum process resulted from original thought, research, and development upon his part. He says, "I naturally reasoned that the removal of the dissolved air from solution would be the means of further benefiting precipitation, providing a vacuum could be practically applied to the solution, prior to, or during precipitation." This "natural reasoning" is logical and obvious in view of the writings of Messrs. Caldecott, Kirk Rose, Keith, and Swinburn upon this subject many years prior to Mr. Crowe's investigations.

In the short discussion that followed Crowe's paper, Professor Clevenger pointed out briefly, but plainly, that it has been known to many interested in cyanidation that gases in the solution were deleterious to precipitation and that the removal of such would be beneficial to subsequent operations, for he plainly stated, "Some of us have done practically the same thing some time ago." Later on (M. & S. P., of August 23) Dr. Keith quotes many instances of degassing pregnant cyanide solutions containing gold and silver prior to precipitation, and, to the impartial observer, makes out a strong case in support of the statement that the basic principle—as well as the process and its application to metallurgy—had been known and used at various places for several years prior to the appearance of the Crowe apparatus and, therefore, degassing a solution does not constitute a new discovery.

Much could be written in support of Dr. Keith's article and assumptions. Moreover the decidedly brief comment arising out of the original paper by Crowe could readily be interpreted as indicating that there was an atmosphere of uncertainty concerning the novelty of the discovery within the meaning of the patent laws of the United States, but these phases of the matter are relatively unimportant compared with the contribution of Philip Argall that appeared in the M. & S. P. for September 20. Presumably ere this letter reaches you several of a similar nature will have been received covering practically the same ground, but the importance of

Mr. Argall's contribution is such as to render it worth while, in the interests of operators of cyanide plants, to get all the information possible concerning the early history as well as the legality of the patent rights surrounding the degassing process; hence the present communication.

One would infer from your editorial comment of Dr. Keith's article that if it could be proved that the idea of removing by means of a vacuum the dissolved oxygen from the solution prior to passing such solution over a precipitant had been previously known, then the Crowe process would not be deemed a new discovery and a novel invention and, therefore, could not be patented. The statement in the opening paragraph of Mr. Argall's letter seems to prove specifically and conclusively that such an idea was known and applied by him at the Independence mill more than eleven years ago. There can be no mistaking or gainsaying Mr. Argall's opening statement to the effect that the object of his communication was to show specifically such application, and if he succeeds—as to my way of thinking he has—in proving that the equivalent to what is known as the Crowe vacuum process was introduced by him and operated in the Independence mill for a number of years prior to Crowe's obtaining a patent upon his process, then it follows that Crowe's process does not constitute "a new discovery" and is, therefore, not patentable.

After making the statement in his initial paragraph that he "intended to show specifically such application," Mr. Argall goes on to describe the basis for his study and subsequent action in the matter of withdrawing the deleterious gases from cyanide solutions containing gold and silver, and makes the important statement that as a result of air-agitation and the loading up of the solutions with gases the prejudicial effects of such gases were recognized, and that shortly afterward the method of overcoming said prejudicial effects was discovered and applied. Here Mr. Argall touches the very pith of the whole matter, as he gives us clearly to understand that he realized at that time that the oxygen contained in the solutions was prejudicial to economic precipitation and that by means of his degassing apparatus he took the necessary steps toward withdrawing the oxygen and other gases prior to passing his solutions over the zinc-boxes. If, therefore, I have correctly interpreted Mr. Argall's statement concerning what he had in mind, and if he did, first of all, recognize the deleterious effect of the oxygen in the solutions upon precipitation in the zinc-boxes, and, if recognizing this condition, he specifically applied the remedy of degassing said solutions prior to passing them over his zinc-boxes, then undoubtedly Mr. Crowe had long been anticipated in his process.

Seeing that Mr. Argall's apparatus consisted of practically the same elements as that comprising the present Crowe process and that as a result of the first unit of his degasser a second unit was subsequently installed at the Independence mill and, furthermore, that the receiver in the second instance was placed vertically instead of horizontally, and moreover that Mr. Argall adopted spe-

cial means in order that the filtrate might spray across the vat and cascade down to the solution level, it seems that the Argall degassing apparatus comprises everything that is included in the so-called Crowe vacuum process and aimed at exactly the same mark as Crowe did several years later.

It is my understanding that Mr. Crowe has been the metallurgist for the Portland Gold Mining Co. for several years, and Mr. Argall states that his degassers were in continuous operation from 1908 to June 30, 1915, when the Independence mill was sold to the Portland company. It is very pertinent to the case to ascertain as to whether or not at the time of Mr. Crowe's taking over the position as metallurgist at the Independence mill, he found the Argall degassers in operation. At this distance from the actual scene of operations and with perhaps but a part of the available evidence, it would seem as if Mr. Crowe found the Argall degassing apparatus in operation and performing satisfactorily, and, taking advantage of the fact that this specific idea of de-oxygenating the solutions prior to precipitation was not commonly known, he (Crowe) availed himself of the opportunity of getting into communication with the Merrill Metallurgical Co. and describing the Argall degasser to them, and then, either individually or jointly with the Merrill Metallurgical Co., possibly slightly modified the Argall degasser and acquired a patent covering such process.

In view of this circumstance, it is my opinion that were the Patent Examiner at Washinton aware of what Mr. Argall had done in the matter, Crowe would never have obtained his patent, and in view of the fact of the Argall degasser producing practically the same results as the Crowe vacuum process, it would seem as if Mr. Argall is perfectly right in stating that the use of apparatus similar to the Argall degasser is free and unrestricted and that the users of such would not be subject to the payment of royalty to the Merrill Metallurgical Company.

In conclusion, I suggest that it would be interesting to hear from Mr. Argall concerning the economy effected in the consumption of zinc and possibly cyanide in consequence of using his degassers.

T. SKEWES SAUNDERS.

El Oro, Mexico, October 3.

The Editor:

Sir—While I do not wish to detract from Mr. Crowe's invention, he having been the first to recognize the importance of de-aerating cyanide solutions—something we knew nothing of then—at the same time the apparatus used in the process or one similar to that described by Philip Argall in your issue of September 20, 1919, was used on the Butters filter-plant of the Standard Consolidated Mining Co. at Bodie, California, in 1908.

The apparatus as designed by Andrew Smith, our master mechanic, consisted of an old boiler set on end with the tubes removed. This was used as a receiver. The receiver connected to the filters and the dry-vacuum

pump to the top of the receiver. An automatic discharge arrangement disposed of the solution whenever a certain level was reached. In other words, we always had a partial vacuum above the solution and inadvertently de-aerated or de-gassed solution, which is practically the Crowe process, though our objective was entirely distinct and we failed to recognize its importance.

Whether the result showed any saving in zinc I am not in a position to state, but Major W. H. Landers, my successor, can probably throw light on this point.

New York, October 9.

ARTHUR FEUST.

The Roof of Reverberatory Furnaces

The Editor:

Sir—I have read with great interest Mr. Oliver E. Jager's article on 'Prolonging the Life of the Roofs of Reverberatory Furnaces at Anaconda' in your issue of July 19, 1919. I agree with him that building ribs on the roofs of reverberatories is an old idea, but I do not agree that the application of this idea to the modern reverberatory originated at the Anaconda smelter.

While at the Great Falls plant, I was working on the problem of prolonging the life of roofs. The trouble was that one particular spot of the roof was getting so bad and large that it was beyond repair and we would have to shut-down the furnace or let the roof fall. Studying all I could get hold of on the subject, I finally came to the old scheme of building ribs. It was the thing I looked for, because no matter how thin the original roof would be getting, it would be prevented from falling by the ribs. The next furnace that went down for repairs was supplied with ribs. It proved to be a great success. Anaconda then followed suit. So it is the Great Falls smelter that should be credited with the application of this old rib scheme to the modern reverberatory.

Gatico, Chile, September 8.

SAMUEL FISCHER.

A METHOD OF PROTECTING iron from rust for which very durable results are claimed has recently been described by Prof. Barff and is referred to in the 'Schweizer Elektrotech. Stg.' The iron is treated at red heat with superheated steam, thus receiving a superficial coating of black oxide that offers complete protection against rust. The coating is of a very hard nature and adheres firmly. In some circumstances the coating formed will resist the action of emery paper for a considerable time, while if the temperature is raised to 650°C. and the time of treatment to 6 or 7 hours it will resist the action of a file. Exposure in the open air to rain or moisture for six weeks did not produce any appearance of rust.

PRACTICALLY all the magnesium marketed in this country in 1918 was manufactured in New York and Maine. As the supply from Germany was cut off, and there was a great demand for its use in star shells, tracer bullets, and trench mortar shells, the United States shipped large quantities of it to the Allies.

The Engineer in Industry

By J. PARKE CHANNING

*Engineers who are in charge of industrial operations—and their number is legion—sense as much as anyone the present feeling of unrest in the country and more than anyone else realize the present inefficiency of labor. The two phenomena are closely correlated and no doubt are due to a multitude of causes which it will be impossible to enumerate. From my experience in mining, I estimate that the present efficiency of labor is only about two-thirds of what it was under pre-war conditions.

In the mining industry, at least, we have not a large surplus of men looking for work, and usually under these conditions men are rather more independent and will not work as efficiently and faithfully as if they felt there were plenty of men ready to take their places. Wages in metal mining have certainly advanced more than the increased cost of normal and sane living. The result is that the men often work fewer days in a month and they do not seem to have much interest in their work while actually engaged in it. Then again, they have been listening to the more or less vague propaganda of the I. W. W. and the radical wing of the Socialists, who are harping on the fact that the distribution of newly-created wealth is unfair and that the laborer really is not working for himself or his fellow-laborers but is carrying on his exertions for the benefit of a small and limited class of exploiters. A continued harping on this view is bound to influence the judgment of even a conservative workman who is not a student of economics and who hears little or nothing upon the other side. I am a great believer in the common-sense of the American people and in the long run I do not think that they will be carried away by unsafe doctrines.

The trouble with so many of these propagandists of industrial inequality is that they do not differentiate between production and distribution. Even if we admit that distribution is unfair, unless goods are produced there will be nothing to distribute. A great many unthinking people seem to feel that wages are paid out of a pot which is inexhaustible and do not realize that eventually what comes out of the pot can never exceed what is put into it. The workman is not paid in money but is paid in goods, money as we all know being used simply as a measure of value and a medium of exchange, and that all that can be used to pay the laborer is what he produces.

We hear talk of over-production. As long as there are men with ragged shoes in the United States can it be possible to produce too many shoes? The answer is obvious. If the average worker at Lynn turns out one pair of shoes per day when he could make two, it necessarily

follows that the mass of the workmen, who are the large users of shoes, will have to pay just twice as much as they should. The same thing applies to coal, to iron, to steel, and to all of the necessities of life.

When it comes to distribution, there undoubtedly in the past have been injustices and there probably are injustices today, but there are sane and logical methods of correcting these abuses or inequalities for which all of us should strive.

The annual production of new wealth in the United States is probably in the neighborhood of 50 billion dollars a year, at least that is the figure which is advanced by some economists for the year 1916. As nearly as may be determined between 35 and 40 billions of this goes to the laborers or workmen, as distinguished from those who work with their brains or who are capitalists. This would give a maximum of about \$1000 per annum to each one of these workers. If the whole 50 billions were distributed to them they could not expect to get over \$1250 per annum. It is manifest, of course, that the laborer cannot expect or demand all this production, because, as we all know, industry will not go on unless it has brains to direct it, and brains must be paid and must be paid better than the man whom he directs.

I am inclined to think that a great deal of the unrest among the laborers is due to the fact that possibly this 40 billion dollars may be inequitably distributed among the different classes of workmen themselves. I have been informed by Mr. W. R. Ingalls, a distinguished member of the American Institute of Mining and Metallurgical Engineers, which organization I represent at this dedication, that he has been at work for a year on an attempt to distribute the income for the United States for 1916. The results of his investigation will soon be published, and in the meantime, I have his permission to quote from some of his deductions as to the distribution in the form of wages. He estimates that for that year 7,000,000 farm laborers received \$400 per annum; 7,000,000 farm proprietors received \$743 per annum, as a money wage, in addition to which they and their families consumed parts of the products of their farms, whose value probably never entered into any statistics. Seven million two hundred thousand factory workers received an average of \$675 per annum; 1,700,000 steam-railway workers received an average of \$886 per annum, and 150,000 metal-mine workers received an average of \$1250 per annum. If we should still further segregate the steam-railway workers, we would find that certain classes of them were very much higher paid than the average and correspondingly other classes much lower paid.

I am not prepared to say that this distribution is unfair, but it simply shows that there are these differences

*An address delivered on September 29 at the dedication of the Pittsburgh Experiment Station of the U. S. Bureau of Mines.

and that it is just as important to consider if they are unfair as it is to consider the possible inequality of the amount given to management and capital. I, myself, take issue with those Socialists who claim that the wage system is a system of robbery. I believe that the wage system is the only system under which production has been successfully carried out and can be successfully carried out, unless perhaps the time might come when human nature was so changed that everybody was equal, both in natural ability and education. It is absolutely false to declare that our present wage system has been the growth of the old feudal system, or that our present capitalists are the descendants of the Feudal barons of the Middle Ages. Every civilized country which has become industrial has by evolution automatically adopted the wage system.

The United States started as a simple community in which almost every family produced all the necessities of life. It was not influenced by any social system that existed in Europe or in England, and yet in the last one hundred years it has automatically and perforce developed an industrialism based on the wage system. So I take this opportunity of saying that I believe the wage system is one that can be justified to the bitter end.

Capital is created only by saving, and saving means putting aside for other uses part of the production of industry so that when a new plant or a new factory has to be built there is food, clothing, furniture, and houses to take care of the men who are building the new plant and getting it into shape before it is capable, in turn, of producing new wealth. Unless out of this 50 billion dollars worth of annual production some is set aside for new construction and renewals it is easy to see where the country would be in a few years.

I believe that a larger proportion of the savings of the country comes from those of the so-called capitalistic and management class than from the laborers, although the conservative laborer is always saving and striving to increase his wealth. It is a fallacy to say that there is a marked division between the classes of employers and workmen, that the world is divided into "exploiters" and "slaves". There is a constant flux, and the rich man today is perhaps working with his hands in a few years, while on the contrary the laborer of today may be, in a few years, in the capitalistic class, simply on account of his own savings and exertions, and be an employer of labor. There is no such thing as a class struggle.

It is a fact undoubtedly that a great many of the newly rich are improperly using their income. Instead of living in a sane manner and keeping a large portion of their income for new capital investments, they are spending every cent they get in extravagances and are encouraging the production of non-essentials. In the same way, I regret to say, the vast majority of workmen are living up to the handle, and in case of illness or death of the breadwinner have not a cent on hand to tide them over. I think that the rich man who indulges in this extravagance is to be more severely censured than the laborer.

I heard only the other day of a titled Englishman who said that before the War he kept on his estate 60 garden-

ers who were principally engaged in keeping the lawns, flower-beds, and hedges in shape, that since the War a large portion of his estate has been turned into agricultural land, that he had reduced his gardeners to 6 and that the other 54 were engaged in the production of food. He stated that he was glad this had occurred and that never again would he return to the old regime.

I believe one thing which has led our unthinking men to harp upon the unequal distribution of wealth is their failure to realize the difference between fixed capital and income. When the proletariat seized the property of the bourgeoisie in Russia he soon found that rugs and furniture and houses would not feed him, and that when the peasants declined to plant more than was necessary for their own use, because they were unwilling to sell the balance for worthless paper roubles, the proletariat in the cities starved by the thousands. We must keep steadily before us the fact that it is the annual flow of production upon which we subsist.

Undoubtedly in the past the employers as a class have been too autocratic and have not taken the workmen into their counsels or treated them as if they were men. There is a feeling that there must be better co-operation between the employer and the workman and I believe that this spirit of co-operation can always be better carried out by managers with an engineering training. Engineering is so intimately connected with all of our production that it cannot go on without it. The engineer, from his very training and experience and his continued contact with the various problems of production, has been made to look at things from an objective and not a subjective point of view. The parlor Bolshevik knows little of the stern realities of industrial life and his theories and suggestions are of but limited value. The engineer, and particularly the engineer-manager, is the main contact between the employer and the workman and the basis of this contact must be the Golden Rule, or as it has been otherwise stated, the principles of justice. If you give a man a 'square deal' he has no 'kick coming.'

In order that this proper appreciation of the human element in industry may be emphasized I am glad to say that most of the engineering schools today have a course in 'Human Engineering', because they realize it is just as important that a man should understand the human machine as it is that he understands the inanimate machine. The older man has got this by experience and the younger man is having it instilled in him in his preliminary technical training.

We hear a good deal today of industrial democracy and I believe a definition of industrial democracy is just as difficult to give as that of political democracy. At a recent convention of 250 manufacturers held at Silver Bay under the auspices of the Y. M. C. A. the consensus of opinion was that the expression 'democracy in industry' was a better term. I am informed that some of the radicals think that democracy in industry means that the workmen should select their foremen and superintendents up to the grade of the general manager, and that he alone should be the one appointed by the company. I consider this is absolutely impracticable. If industry is to

be carried on efficiently the manager, the superintendents, and the foremen must be selected by the company. It is here that the greatest care must be taken. The management may have most excellent ideas in regard to its relations with the men, but if the superintendents and the foremen are not well instructed and in sympathy with these ideas the whole desires of the management may go for naught. It is today being more and more realized that foremen should be selected for their knowledge of human nature and their capacity to get on with men rather than for their technical skill in their particular departments.

To my mind, democracy in industry means co-operation with the workmen, in discussing with them the question of wages, hours of work, and working conditions. The question of working conditions is the most important, and on it will depend the health and comfort of the worker and the efficiency of the plant. Many a good suggestion comes from a workman and it is foolish to repress him and not give him an opportunity of making suggestions which if adopted will give him, and perhaps even his associates, the greatest joy of their lives. I had the opportunity the other day of hearing Mr. H. Mensforth of Manchester, England, who is the manager of a large industrial plant and who also is the president of the Manchester District Engineering Trades Employers Association, make an address and the next day I met him personally and got from him a most excellent and illuminating description of the growth and co-operation between the employers and the workmen in England, this co-operation being done primarily between what is known as 'works committees'. Much to my surprise, he told me that this growth was all inside the last three years, that three years ago there probably were not over a dozen works committees in England, and that today he doubted if there were more than that number of shops which did not have these committees.

Such committees, for example, consist of 12 men selected from the workmen and 2 men selected from the staff representing the company. This committee meets once a week on company time and matters are brought up before it on the initiative either of the workmen or of the management. Mr. Mensforth said it was surprising to learn the number of satisfactory decisions which they made and the way in which they eliminated so many previous sources of friction. He said he thought we in America should profit by their experience and have sufficient vision to realize the advantage of this co-operation. He admitted that undoubtedly it would be easier to adjust industrial relations in England, because of the fact that practically all the men spoke English and down in the bottom of their hearts were Britons through and through; they believed in the constitution of their country and had an abiding respect for law and order. He realized that our problem in the United States, with our vast unassimilated mass of foreigners, was a harder one. And right here let me say that I think one of the important things we should do is to carry out our problem of Americanization, and the first thing in Americanization is that a man should learn the English language.

Mr. Mensforth further told me that the management in hundreds of factories realized the importance of education, and particularly of education for the younger men, and that in their works they had established schools in which the younger men were instructed on company time, feeling that this instruction of the men eventually redounded to the company's advantage. Their general scheme was first to try to inculcate in these young men the ideas of good citizenship and then to give them technical instruction in the business. Outside teachers were never used, the teachers always being drawn from their own foremen, engineers, and from among the better class of workmen. The results were threefold: the young men were taught, the foremen were taught, and a bond of sympathy was created between them.

The engineer, then, in his relations with the workmen must realize that first and foremost there must be justice. He must realize that the health of the men must be conserved. No sick man can ever have a sane view of life. He must strive as much as possible to make the workman have an interest in his work, explaining to him the operations which are apparently inexplicable and the bearing which they have upon the industry or the work of the plant as a whole. He must encourage the men toward right living and economy, as one of the greatest desires and satisfactions of life is to own something. He must see that as far as possible his plant is made attractive, because a man feels better and works better in a well-lighted, well-ventilated, and well-kept plant than in a dirty grimy place; and lastly, he must not repress the desires of the workmen to associate, but should encourage his men to get together and to form associations just the same as he, himself, belongs to his various engineering organizations. But at the head of it all, and as his guiding star, he must remember that justice is at the basis of all industrial as well as social relations.

THE New South Wales Government geologist recently visited the Ardlethan tin field and inspected the principal mines, including the Carpathia, White Crystal, New Venture, and Big and Little Bygoo. He expressed himself as pleased with the potential wealth of the field. In his opinion the time is not far distant when the ore will be mined in bulk, as much of the country contains payable tin that is lost or overlooked by the present method of working only the richer shoots. He stated in his report that the Ardlethan field may properly be regarded as a valuable national asset, and everything appears to show that its value and resources are not yet nearly proved or appreciated.

SALT is plentiful in the United States, and more of it was produced in 1918 than in any preceding year, yet the rise in its price helped a little to increase the high cost of living. The average price of salt per ton in 1914 was \$2.09; the average price in 1918 was \$3.72, an increase of 78%. Producers in the United States in 1918 received nearly \$27,000,000, which was \$7,000,000, or 35%, more than they realized in 1917.

FIG. 1. LONGITUDINAL SECTION OF THE PLANT

The Hornet Crushing Plant

By LLOYD C. WHITE

INTRODUCTION. Reference has recently been made* to the large deposits of sulphide ore in Shasta county, California. The following notes have to do with the methods of preparing the pyritic ore for the market, as applied by the Mountain Copper Company in the exploitation of the Hornet orebody. This orebody is a nearly pure iron pyrite, there being ordinarily not more than 1 to 2% of silica in the ore as mined, so that the only treatment necessary for 80 to 90% of the ore is to crush and size it to satisfy the different customers. The 10 to 20% of ore remaining contains varying percentages of waste, which is the rock that falls when the top of each block of ore is caved in the ordinary course of mining. The treatment of this second-class ore, as it is called, will be explained later.

Previous to 1918 the Hornet ore was all hauled from the upper main adit to the old crushing-plant. Here it was passed through a Blake crusher, set with a $2\frac{1}{2}$ in. opening, and sized into two products designated locally as 'nuts' and 'fines', corresponding in size to about plus $1\frac{1}{4}$ in. ring to 3 in. and minus $1\frac{1}{4}$ in. ring, respectively. These products were lowered to the Iron Mountain Railroad bins over a surface shuttle-tramway, in steel cars of three tons capacity. The tramway was about 600 ft. long with a 25° to 30° slope. One man at the top loaded the cars and handled the brakes, while another man dumped the cars at the lower terminal. This tramway was always more or less dangerous on account of the

breakage of cables. Owing to the free acid in the ore-dust which penetrated the cables, corrosion was rapid; this action was accelerated in rainy weather.

THE NEW PLANT. Before the exhaustion of the ore above the old main adit, a new tunnel was driven into the orebody some 150 ft. in elevation below the old one. During the period of this work and the time subsequently required in opening up the orebody for mining, a new crushing and sorting plant was built. Thus it may be said that the Hornet was starting life again with a new mine and a new mill. In the design of this plant probably the only point of general interest is the method of transporting the ore from the crushing-plant to the railroad bins. On account of trouble with the old surface tramway, and because the new plant was much nearer the railroad bins, it was decided to employ belt-conveyors to carry the ore. Fig. 1 shows the general arrangement of the plant and the two principal conveyors. In the old crushing-plant the ore was sized (as stated above) and the two products lowered by surface tram to the railroad bins. In the new plant the sizing is done over the railroad bins; this arrangement makes one less bin necessary and enables one conveyor to serve the plant. There is no trouble whatever in the operation of down-hill conveyors on this grade. They are built in the same manner as up-hill conveyors and driven from the head end. As a matter of fact, no driving power is required for these down-hill conveyors; once they are in motion with a load they generate power. The speed must be regulated, how-

*Herbert Lang, 'M. & S. P.', July 12, 1919.

ever, and this is done in the case of No. 1 conveyor by driving it with a small motor through two sets of spur-gears. No. 2 conveyor is driven from the shaft that drives the trommel; therefore any power generated by No. 2 conveyor helps to drive the trommel.

The tower bin between the crushing-plant and railroad bins was built for several reasons: (1) To reduce the grade in the conveyors; (2) to provide additional storage; (3) to make possible the changing of screens on the trommel over the railroad bin without shutting down the crusher; and (4) to act as a receiving and mixing bin for the wet jig-concentrate from the second-class plant. (See Fig. 2.)

To summarize, the first-class pyrite is hauled from the mine to the crushing-plant by electric power; passed through a No. 6 Gates gyratory breaker and conveyed to the trommel over the railroad bins, where it is screened into three sizes, namely, minus $\frac{3}{8}$ in., plus $\frac{3}{8}$ in., minus $1\frac{1}{2}$ in., plus $1\frac{1}{2}$ in., which includes pieces up to 4 in. maximum.

SECOND-CLASS ORE. The 10 to 20% of ore coming from the mine containing waste is dumped into the second-class bin. This ore is fed to a trommel having screens with 1½ in. openings. The oversize from the trommel goes to the No. 3 conveyor, where all the waste is picked off. This waste, in turn, is carried by the No. 4 conveyor to the waste-dump. The No. 3 conveyor delivers its clean ore to the gyratory breaker. About 14-in. pieces are the maximum size handled on conveyors No. 3 and 4. The undersize from the trommel goes by No. 5 conveyor to the jig-storage bin. From here this unsized product is fed by means of a Challenge disc-feeder to four one-compartment Harz jigs. This ore is an ideal material for jigging, as there is no middling product. Every particle is either clean pyrite or clean waste. The hutch product from these jigs is clean ore and flows to a special dewatering bin at the railroad terminal. The 'cup' ore is dewatered and carried by No. 6 conveyor to the tower bin, already mentioned. The jig-tailing goes to the waste-laundry.

We now have the various sizes of ore in the railroad bins. The coarsest product, namely, plus 1½-in. ring to 4-in. size is a finished product and is hauled to Keswick over the Iron Mountain Railroad. Here it is transferred to broad-gauge cars and shipped to customers in the vicinity of San Francisco. The finest product, namely, the minus ¾ in. and the jig-hutch product are also finished products and follow the same route as the coarsest material.

The intermediate product, namely, plus $\frac{3}{8}$ in. and minus $1\frac{1}{2}$ in., are hauled to Keswick and put through a crushing-plant that yields a final product through a $\frac{3}{8}$ -in. screen. Therefore, the final products leaving Keswick are minus $\frac{3}{8}$ -in. pyrite and plus $1\frac{1}{2}$ -in. pyrite. The uses to which this ore is put and its subsequent treatment by the Mountain Copper Company has been outlined in this journal.

MAGNESITE is mined in only two States in the United States and most of the output is used in steel-making plants and for the manufacture of refractory products and sanitary flooring. The domestic producers of magnesite suffered serious handicaps in 1918 by reason of restrictions on freight shipments, of the increase of the imports of magnesite from Canada from 3000 tons in 1917 to 20,000 tons in 1918, and of the use of substitutes for magnesite. Many of the producers who were not equipped

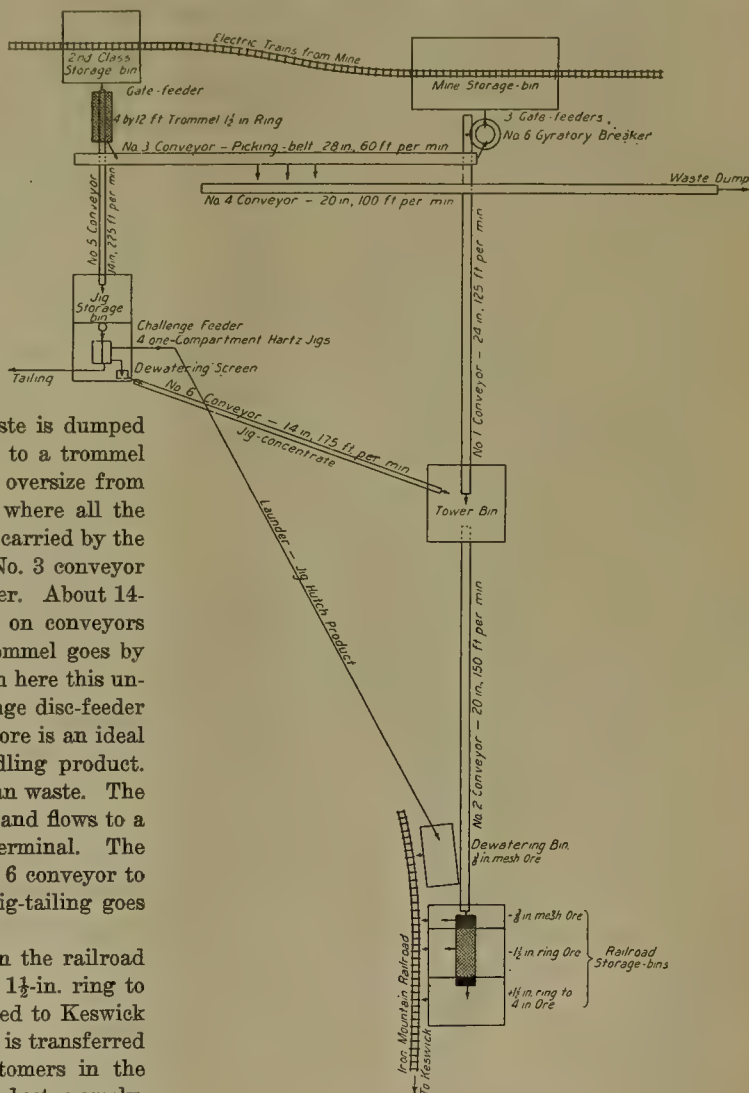

FIG. 2. PLAN OF THE PLANT

with kilns lost business because the makers of magnesite refractory products insisted on having calcined or dead burned material, which is so much lighter in weight than raw magnesite that its shipment saves half the freight charges. The deposits of magnesite in this country are capable of supplying all the domestic demand, but they are so far from the principal market, which is among the steel plants and the sanitary-flooring plants of the region east of the Mississippi, that their product cannot compete with imported magnesite, if entered at pre-war prices.

A Stable Government for Mexico

By BLAMEY STEVENS

People who have only lived in democratic countries are often too apt to think that they have an elixir for all the ills to which nations are subject. Democracy should rather be regarded as a stage in the evolution of governments; history shows plainly enough that it has been arrived at in an evolutionary way, but people are wont to think that it is a new discovery and that the intermediate stages by which the discovery was made are unnecessary ones for a new and politically uneducated people to take.

Democracy is no new discovery. More or less of it is to be found among the most primitive tribes and nations, quite enough, in fact, to have suggested to the Oriental idealists the possibilities of the modern system. Religions always have been based on democratic principles. But governmental democracy did not develop until the conditions were ripe for it. The fruit does not ripen until it has grown; try to force it to ripen prematurely, and it rots instead. The young bird cannot fly until its wing-feathers are grown; force it, and it falls out of the nest.

At the beginning of the present Mexican revolution practical people, who knew the conditions, advocated a return to a dictatorship. Later the foreign element—and if the facts were known, probably a considerable portion of the native element—have been in favor of 'Cubanizing' Mexico. The great importance of the subject warrants an investigation of the fundamentals of government, particularly as they affect the undeveloped peoples.

When Cortez arrived in Mexico in the 15th century, he found the Aztecs had a stable government, and that civilization had therefore made great progress among the natives. That government was a monarchy. The Spaniards conducted a stable government of a monarchical form in Mexico, until the beginning of the 19th century. Mexico City, under the Spaniards, was one of a centre of learning and culture; it had a municipal government, elected by the people, and great improvements were being made. The people of the country were as ignorant as they are now, but, having enough food and clothing, were contented. The revolution of 1810, although due to the shortsightedness of Spanish statesmen, was started by people of the Spanish race and not by the Mexicans. At that time the people of the United States, being politically educated, had been able to establish a successful republican government. For this reason the American countries that freed themselves from Spanish rule chose republican governments. Of these, none were successful until enough politically educated people migrated from Europe so as to control the native element. Mexico has heretofore been unable to induce European immigration on a large scale, prob-

ably because of its close proximity to the United States.

No ignorant people ever initiated a stable form of national government, based on a purely elective system, and it may be said with assurance that no such people ever will. The natural, or evolutionary, course for them to adopt is that of a monarchy, with a gradual substitution of more democratic forms, as the political education of the people advances.

The Mexican people have as well defined a nationality as the Americans; they are as jealous of the sovereignty of their country, and, except for a stubborn fanatic minority, equally recognize their obligations as one of a family of nations. But this is not all that is necessary. For stable government there must be internal agreement about the choice of executives.

A monarch has a life position, a presidential term only lasts a few years, and even when the monarch dies, the succession is definitely established. A king or emperor is rich enough so that he can afford to be honest. Presidents are politicians, and the more politically ignorant the people, the more do elective politicians become the scum of society. Consequently, presidents of immature republics enrich themselves and their retainers during a short term of office, and with this thought uppermost in their minds they are not likely to devote any supreme effort to administrative duties.

Take the cases of Japan and China: Japan had her revolution when republican ideals had not spread over the world, as they have now. She turned out all the parasitic politicians who had usurped the functions of the Mikado. She returned him to his proper power, and her devotion and loyalty have rested in him to such an extent that it is a religion. Only by thus securing and ensuring her internal unity was Japan able to make such remarkable strides in civilization. She has attained to a fairly democratic form of government. On the other hand, China has waited until modern ideals predominated, and instead of abolishing the mandarins and establishing a strong monarchy with a more or less democratic constitution, she is trying the dangerous experiment of a premature republic. By skipping this necessary link in the evolutionary scale, she has no doubt assigned herself more revolutionary trouble, and if she so persists, will probably retard her progress in civilization many decades.

With the gradual development of political education among the subjects of a monarch, his functions are transferred to officers elected on the basis of party politics. The monarch thus becomes neutral and able to command the respect of all the people, and the two political parties are prevented from falling entirely apart and taking up arms. The Emperor Maximilian of Mexico was the choice of only one party, the Catholics,

and was thus considered by the Liberals purely as a party man and a foreign invader. The Russian monarchy made the mistake of not pushing the education of the people and of granting the franchise before they were educated. She suffered for these mistakes in such a way that no other country will wish to follow her example. The German government pushed the education of her people, giving them only a limited franchise, and has now emerged as an enlightened democracy. The last step has been precipitated by the War, but in any case it would have happened sooner or later.

It is clear in these days that the proper and safe way to develop a backward people is to educate the individuals, granting them, as they become educated, a certain measure of franchise, but maintaining in the meantime a monarchic balance of control or its equivalent, such as the United States maintains in Cuba and the Philippines. Cuba already had considerable political education under Spanish rule and through immigration from Spain. In spite of her democratic constitution, Mexico has had nothing but a succession of dictators. Having an advanced constitution, she has had a kind of government determined by the political education of the people. She has been without machinery to take care of the succession, and the fact of the illegal existence of the dictatorship has been a continual cause of disturbances. In short, her government has been a lie unto itself. The political education of a people is almost impossible under such conditions. Although the present government may have certain ideas of serving the interests of the people, as others in the past have had, it does not really represent the choice of the people. It is simply accepted as being better than anarchy. In reality, it is an oligarchy, supported by the army. Some of its adherents have a hope of consolidating it into a wholly democratic—even socialistic—government, but this ideal fails to take into account the basic fact to which the actual government must conform, namely, the low average political education of the people.

An oligarchy may be better than a monarchy in that it depends on more than one individual. It may therefore be better balanced in its ideas and not necessarily terminated by the death of one man. But it is liable to split up into conflicting parties and thus to lose the most important property of a government, that of stability. This tendency is well illustrated in the feelings beginning to rage in Mexico in anticipation of the next presidential election.

The party tendency develops in any assembly of people who have political matters to attend to, and if properly controlled it is a good and wholesome tendency. But when the control rests with an ignorant and disinterested populace, it cannot be relied upon. The accession of Porfirio Diaz came about by reason of a dispute as to the election returns, which were controlled by his predecessor. The accession of Francisco Madero came about after a similar dispute, but one which unfortunately did not end by his election. It may be said that this is the general and chronic cause of the starting of revolutions in Mexico. As a result of these revolutions, the

people have become educated to the idea that the executive must be elected, and any system of government for Mexico must now be based on this idea of an elected executive. Associated with this idea, however, in the minds of the people, is the old one that the government really rests wholly with the executive; that he is directly responsible for all the adverse conditions which affect the country or any part of it. In the minds of the people he never ceases to belong to one political party, and because of the adverse conditions that party continues to lose ground until nearly the whole population is opposed to it.

France passed through a similar stage, but in her case, not being influenced by the proximity of a great and successful republic, she was able to revert back to monarchy of a legitimate order and so obtain peaceable opportunity to improve her people in balanced political education. England, with a democratic education, dating back to Saxon times, and no more advanced nation to ape, had very little trouble in holding a stable government, and was therefore able to gain wealth and strength in an unprecedented manner, in spite of the easy-going ways of her people and the lack of any commercial organization, such as the Germans have. While the Mexicans, as a people, have acquired the idea of the election of a president, that of the election of other officers of the government had not been inculcated into them; and therefore we may look for the creation of an instrument of governmental stability in this direction.

The function of government, which really calls for the direct will of the people, is that of legislation. If the laws made by the people are obeyed, it really matters very little by whom they are endorsed, so long as in the process there is no dishonesty. The highest honesty obtainable in governmental matters is not that of elected officers, or of officers appointed for a short term by elected officers. The most honestly administered country in the world is said to be India, which is a government of experts, educated up to their positions, well paid, and pensioned.

The most important function for the maintenance of a stable government in Mexico is the control of elections. I suggest that the control of such elections should be in the hands of permanent experts, educated up to their positions, well paid, and pensioned. I believe that the Mexican people would soon learn to put confidence in such a body of experts and to respect them. There are many ways in which the machinery for this purpose might be constructed and arranged and one may be mentioned to show that there is a practical way. Let the functions of the Supreme Court be extended so as to include the policing of the country. Let a body of Rurales (Federal police) be formed under the orders of the Supreme Court and let all elections be in their charge. Instead of having the Supreme Court judges elected by Congress, let them be appointed by the President, because a president is usually a bigger man than Congressmen; he feels his responsibility more and in general would be more honest in such matters. As only two or three judges would be retired in each presidential

term, the Supreme Court would never be under the influence of any president; and party control would be sure to change every few years. It would, however, be impossible to start such an organization with any one in power, as the opposing party would be suspicious, and with reason, of the appointments made.

American intervention is much talked of, but an intervention initiated by the United States is inconsistent with the covenant of the League of Nations. The Monroe doctrine is acknowledged, but that doctrine does not anticipate intervention. Hence the initiative must come from the League.

The men necessary for the formation of a Mexican Supreme Court, with such extended scope of duties, of power, and of responsibility, are available. They should be men who have taken no active part in politics and are known by their past as honorable and well balanced. Among Mexicans who can read and write the average standard of education and culture is probably higher than that obtaining in the United States.

The franchise among a backward people should not be granted to illiterates; otherwise, it is impossible to get a respectable standard of representatives and officials. All successful democracies have been evolved through a period of limited enfranchisement. De Witte, in Russia, made a fatal mistake of granting the franchise for an uneducated, although apparently tractable population. This gave an opportunity to unscrupulous politicians to gain support by preaching glittering fallacies, and that kind of education led to Bolshevik control.

Candidates for election should not only not be illiterate, but should have had a good education; there is no lack of such material in Mexico. In a country where the basic elements of government have to be constructed, it is much more important to have educated men as legislators, than in a country where only minor modifications have to be made to meet changing conditions. Education in a backward country should include the fundamentals of government; political education should not be picked up from spread-eagle orators and I. W. W. agitators.

The written constitution of Mexico is not in the minds of the people the fixed and stable anchor that it is considered to be in the United States; it is rather a code of politics to be reconstructed by any armed political party that may break into power, and it represents the political professions of such a party. As a matter of fact, the written constitution of any country is not of much importance in making for governmental stability. It is rather the constitution evolved in the minds of the people, that which we have previously called political education, that is really the controlling factor. The constitution serves its purpose as a basis for the laws of the country, but want of stability is not due to want of laws or to want of reasonable respect of them by the people in general.

Even within the narrow range of American experience, the evolutionary nature of government has been noticed. Thus, Woodrow Wilson, in the election campaign of 1912, said: "We have been praised all over the world for our singular genius for setting up successful institutions, but a very thoughtful Englishman, and a very witty one,

said a very instructive thing about that: He said that to show that the American Constitution had worked well was no proof that it is an excellent constitution, because Americans could run any constitution—a compliment which we laid like sweet unction to our soul; and yet a criticism, which ought to set us thinking. Living political constitutions must be Darwinian in structure, and in practice. Society is a living organism and must obey the laws of life, not of mechanics; it must develop. Government is not a machine but a living thing. It falls, not under the theory of the universe, but under the theory of organic life. It is accountable to Darwin, not to Newton. It is modified by its environment, necessitated by its tasks, shaped to its functions, by sheer pressure of life."

The necessity for political education is now seen for the further experiment denominated as the League of Nations. It is clear that the nations are slow to see wisdom in giving up private national privileges to obtain an international democracy; in buying international stability with a surrender of national license. But it is perfectly logical to think that the close analogy which exists between individuals of a nation and nations of a league justifies the inference that international democracy in some form must come as political education advances, and therefore it is only right and proper to begin now, provided that a correct basis is secured and developed by evolutionary means. The Germans thought to benefit the world by an international monarchy, and that might have been an advantage in by-gone ages, but so much of the world is now educated to democracy, that the idea of an international monarchy cannot possibly take root. The change from the idea of international anarchy to international democracy will, however, be slow. Statesmen are accustomed to the entirely selfish national view. The mutual confidence necessary to the attainment of a higher ethical standard is always slow and difficult to attain.

REPORTS received from the shippers by the U. S. Geological Survey show that for the six months ended June 30, 1919, the shipments of high-grade manganese ore amounted to 44,539 tons. The shipments for the first quarter of 1919 were 23,937 tons and those for the second quarter were 20,602 tons. The total shipments of high-grade ore for this period of six months were less than those for the quarter of the year 1918 in which the shipments were lowest—the first quarter—in which they were 55,682. During the three quarters from October 1, 1918, to June 30, 1919, the shipments of high-grade ore showed a steady decrease. The number of shippers of high-grade ore during the first six months of 1919 was only 30, whereas the number for the year 1918 was 247. The total shipments of low-grade ore containing 10 to 35% of manganese for the six months ended June 30, 1919, were 86,158 tons. The total shipments for the six months were nearly two and one-half times the total for the first quarter of 1919. The shipments of ore containing 5 to 10% manganese were 130 tons for the first quarter of 1919, and 16,741 tons for the second quarter.

REVIEW OF MINING

FROM OUR OWN CORRESPONDENTS IN THE FIELD

ARIZONA

CALUMET & ARIZONA DEEPENING SHAFT.—OIL BOOM NEAR DOUGLAS.

BISBEE.—The Campbell shaft of the Calumet & Arizona Mining Co. is being carried down from the surface to join the raise which was completed several months ago at a height of 669 ft. above the 1300-ft. level. The raise has two and a half compartments, and the shaft two compartments. Later, when the two have been joined, it is intended to enlarge the shaft to conform with the company standard and to line it with concrete. The shaft now has reached a total depth of 270 ft. The Night Hawk lease, which recently opened a body of high-grade ore on the 650-ft. level, has developed a large tonnage during the last few weeks, with the result of increasing the confidence of its owners and the general public in the permanency of the orebodies in the vicinity of Don Luis, a hitherto neglected section of the Warren district.

DOUGLAS.—Mining interest here was superseded recently by an oil boom which has caused several hundred local people to locate land in the Sulphur Springs valley and the San Bernardino valley, just across the Perilla range from the city of Douglas. Altogether between 500 and 600 local people have filed locations on land in that region, where geologists have declared there is strong indication of oil. Arrangements have been made to bring three rigs into the field and at least one drilling contract with a six months clause has been signed. Considerable patented land not open to location has been leased.

AJO.—New Cornelia Copper Co. probably will erect a smelter and refinery here in addition to the 10,000-ton flotation plant, according to John C. Greenway, general manager. The 500-ton flotation plant, which was used as an experimental mill, is working smoothly and satisfactorily in every way, the recovery being good. The test in the 500-ton mill will be completed in about ten months. Upon these results will be based the permanent construction, which is expected to start soon thereafter. It is hoped that as soon as the steam-shovels have reached the sulphides in the pit the permanent flotation plant will be ready for operation. At the outset a unit of 5000 tons will be used; at the same time the leaching-plant will be treating a similar tonnage, making a total of 10,000 tons daily. To avoid taking the concentrates to Douglas permanently, which is the present practice, a smelter will probably be constructed on the property. The leaching-plant will outlive its usefulness in from six to eight years, when all known carbonates will have been treated. That will not mean discontinuance of shipments of refined copper, as a refinery will be built upon the leaching-

plant site. In the event that this is done, Ajo will continue to be the only mining camp in the State that does not have to send its copper eastward for refining. By the time the leaching-plant has completed treatment of all the carbonate ores, another 5000-ton unit will have been added to the flotation plant, which then will have a daily capacity of 10,000 tons. The proposed increase in tonnage treated daily would mean an increase in production from about 40,000,000 lb. annually to approximately double that amount, since the sulphides average higher in copper content than do the carbonates now being treated. New Cornelia then would rank among the first producers not alone of Arizona but of the West.

TUCSON.—A two and a half compartment shaft now is being sunk on the property of the Arizona-Tucson Copper Co., in the Tucson mountains, 8 miles south-west of Tucson, it being the intention of the company recently organized to explore the property at depth to ascertain whether or not the high-grade ore existing in the glory-hole a few feet under the surface continues with depth. The glory-hole shows an orebody between 30 and 40 ft. in width to a depth of 60 ft. The shaft is being sunk about 100 ft. from the old shaft and in the main core of the ore-chimney.

PATAGONIA.—The Three R mine, a silver-lead property worked spasmodically since the days of the civil war, has been bonded by the owner, R. R. Richardson, to the Magma Copper Co., which is to take possession the latter part of October. The Hardshell company is sinking a double-compartment shaft, which now has reached a depth of approximately 400 ft., the object being to cut a vein already tapped by an incline-shaft. The vein is expected to be cut at a depth between 700 and 800 ft. The Mowry mine is making an excellent showing, shipping an average of a carload of lead carbonate and galena daily to El Paso for smelting. The mining is being done on a new orebody encountered a few months ago on the 260-ft. level. This is an extension of the big orebody worked in the early days of the mine. The Pierce-Gardner property is shipping an average of four cars weekly of silver ore to El Paso, netting around \$1000 per car. The property was opened up in the war period for manganese and for a time was active in shipping for that metal only. About eight months ago Mr. Pierce assayed samples of the manganese ore for silver and found the silver content so high that it was decided to push mining and development work in order to take advantage of the high silver prices. The main shaft has reached a depth of only about 150 ft., but ore has been mined almost from the surface by underhand stopping methods. Three shifts approximating

a total of 30 men now are employed. The Flux mine now has about 100,000 tons of ore blocked out, 60,000 tons of carbonates and the remainder sulphides. An active campaign of development is about to be started which, when completed, should add greatly to the ore-reserves. The company plans to build a smelter of 100 tons capacity about the middle of next year. The mine is developed to the 130-ft. level, a total of about 5000 ft. The glory-hole extends from the surface to the 70-ft. level and is about 100 ft. square. On the 100-ft. level the orebody measures 400 by 250 ft. of solid carbonates. The change from the carbonate to the sulphide zone takes place at the 130-ft. level. A winze extending from the 130-ft. level to a depth of 130 ft., a total vertical depth of 260 ft., is in solid sulphides, running from 7 to 11 oz. silver and from 11 to 19% lead. A 100-ton mill, a combination of gravity and flotation processes, is on the property.

COLORADO

LEADVILLE AND CRIPPLE CREEK.

LEADVILLE.—A company is being organized by A. A. Garrett and associates, to be known as the Prospecting Mountain Tunnel & Development Co. to drive a tunnel into Canterbury hill to explore veins and dikes believed to extend from Fryer hill into the mountain. The proposed tunnel will be driven 5000 ft. in a direction approximately S 25° E, cutting through the southern end of Prospect mountain. The depth directly under the summit of Canterbury hill will be 700 ft.; under the Roseville shaft 250 ft.; and under the Minneapolis shaft 500 ft. High-grade ore was mined in the Roseville when sunk in 1881. Water was then encountered and work abandoned. Manganese ore is reported to have been found at the 350-ft. level of the Canterbury shaft. Leadville mining men have subscribed liberally to the organization.

A good grade of zinc ore is under development by lessees of the Shamus O'Brien on Yankee hill. In the same vicinity the Bull's Eye claim of the Iron Silver Mining Co. has been leased and the lessee, Alfred Swanson, has secured a contract to supply the Pueblo smelter with 500 tons of argentiferous iron ore. A vein of silver-bearing ore has been opened on the Sailor Boy in Lincoln gulch by George Nichols and associates. Arrangements have been made to continue at work through the winter months. The Ruby mine, owned by a British syndicate, has been leased to W. Kirby and Aspen associates. The property when last operated was a producer of high-grade silver ore. John Cortellini and Leadville associates have taken leases on the Dolomite, Echo Laurel, and General Grant properties in the Adelaide Park district. This region has been little developed, but is known to be heavily mineralized from the surface workings on the group. The Clear Grit, in Iowa gulch, will shortly resume under lease to Frank G. Peck, president of the Portland company of Cripple Creek. Linemen are now connecting up with the power line of the Colorado Power company.

CRIPPLE CREEK.—Stockholders of the Isabella Mines company are invited by a circular letter signed by C. M. Carson, vice-president of the company, to participate in the organization of the Isabella Leasing company, formed for the purpose of further development of the Isabella estate on Bull hill. As set forth in the letter, development on company account has been impossible "because of the advance in price of mining material and labor, occasioned by the War." The lease, it is understood, will be granted the new company for a five-year term, with the privilege of a three-year extension, and royalties on ore marketed will be on a sliding scale. The ground included in the lease extends from the eleventh level of the Lee shaft to the bottom, or fifteenth, level, west from the west sideline of the Orphan No. 1 and includes the Orphan No. 2, Ida Bell No. 1 and 2, Emma No. 1, Comet and Jack Rabbit lodes No. 1 to 4 inclusive, Ex., J. Gold, Bully, and Tom Thumb lode claims. It is proposed, according to the circular, to start work on the 15th level of the Lee shaft, taking advantage of a cross-cut 1000 ft. long and to continue the cross-cut 300 ft. to cut the Sump and Buena Vista veins. The veins would then be cut at a depth of 450 ft. below the Buena Vista and Sump ore-shoots that produced approximately three million dollars. It is further proposed to continue the cross-cut some 200 ft. farther to explore the junction of the Buena Vista and Maloney veins, the No. 2 vein, No. 3 vein, and finally the Emma vein. All of these veins have produced ore in the upper workings. Subscriptions to the leasing company stock will be limited to 6000 shares of the par value of \$1 each.

The Modoc Consolidated Mines Co. is now shipping at the rate of from 60 to 75 tons daily. The new ore-house has been completed, the hoisting capacity increased by use of the counterbalance in the three-compartment No. 2 shaft, and track laid to the ore-house to permit loading ore direct. It is estimated 15,000 tons of ore lies broken in the filled stopes at the 1200-ft. level, and the work of pulling the stope has commenced. The rock will sort, it is estimated, to fully 5000 tons of shipping-grade ore ranging in tenor from one to five ounces gold per ton, the higher tenor obtaining in the screenings. Deep development and exploration of the Combination claim will, it is reported, soon be commenced, when the labor situation is improved by the return of miners to the district for the winter months.

The machinery at the Gold Coin shaft of the Granite Gold Mining Co., situated in the city of Victor, is to be dismantled and sold. The plant was one of the most costly ever installed in the district. The veins of the Gold Coin have been worked out to the bottom or 1200-ft. level, and except for scattered bunches of ore now being cleaned up by lessees no work is being done on this end of the property. The labor shortage is serious, and but for the fact that miners are expected to return to Cripple Creek for the winter, the situation would be critical. Both the Portland and Cresson mines are operating with greatly reduced forces, but as a higher wage-scale cannot be paid, men are leaving for other districts.

LA PLATA.—After a temporary period of activity, production has come to a standstill, although development continues on many of the properties, and on a few a force of men will be employed during the winter months. McCloskey & Co. are leasing the Bessie G. to Grisenti & Co. for a period of two years. The lessees recently made a small shipment carrying gold. The Eagle Pass M. & M. Co. has leased the upper workings to B. Caramouziz & Co. for a year; ore is being packed out from the Durango Girl; the Boren Gulch M. & M. Co. has opened up a run of good milling ore.

RICO.—Shipments are not heavy since the closing down of the Marmatite M. & M. Co. operations, but development continues. The Rico Argentine M. Co. compressor repairs are completed and a force of men is at work get-

MICHIGAN

INTEREST IN PROSPECTING OPERATIONS.—ACTIVITIES AT THE COLLEGE OF MINES.

Mining men in the Lake Superior copper district to-day are watching closely the development and prospecting operations conducted at properties that are in the prospect stage. At all the active producers of copper there is nothing of unusual interest to report, production going forward at a figure which indicates plainly enough the ability to increase the amount at any time such action is considered necessary, although the evidence is that no such step is to be taken in the immediate future. Work at such exploration properties as the Mayflower, Seneca, the Hancock Con., and the expected resumption of opera-

TOP OF 25,000-TON ORE-BIN, RAY CON. COPPER CO. CONCENTRATOR, HAYDEN, ARIZONA

ting out ore for shipment. The Rico Wellington Mining Co. has completed the extension to its tramway, and is now shipping high-grade copper ore. The Rosebud mill is about completed, and the Silver Gulch M. & M. Co. expects to commence milling by November 1. The Gold Anchor group, situated on Calico Peak, and consisting of the Johnny Bull, the Gold Anchor, the Gold Anchor Extension, the Silver Queen, the Last Effort, Caledonia, Cambria, Albion, Owl Tunnel, Owl Lodes No. 1, 2, 3, and 4, Spanking Jack, and Legal Tender claims, has been leased for three years under a bond and lease to Virden & Thomas. Recent trial shipments brought excellent returns, the ore carrying 30% copper, and 3 oz. of gold. After a period of development work, the lessees on the Telegraph vein of the Resolute are shipping ore.

OPHIR.—The Ophir Gold Mining & Reduction Co. continues development of its holdings, the April Fool and the New Dominion. A body of milling ore has been developed, 2500 ft. of driving having been completed.

tions at the Arcadian and the Bear Lake are attracting more attention than the steady progress of events at the big producers. At the Mayflower-Old Colony shaft there is no material change in the underground conditions, no lateral work going forward, and the shaft itself remains in solid trap-rock. Shaft-sinking will continue for at least another 100 ft. It is expected that when that depth is reached the geological structure will be evident. The particular interest in this work at the Mayflower is to see if the shaft will intersect the ore that was shown in the drill-core. In this district development does not always check the results found by diamond-drilling. The Indiana is an example of that sort of thing. The Indiana core was the richest ever taken out of any property on the south range of the Michigan copper district, causing such a sensation that the stock of this remarkable prospect went as high as \$32 per share and couldn't be bought at that figure, yet nothing like that drill-core ever has been found by development. The second reason for the

interest in Mayflower rests in the fact that it is out of bounds. If copper is found in the shaft it will upset many geological theories of the Copper District. It would open possibilities in a direction that never have been considered promising, for the Mayflower is supposedly outside the mineralized zone. In that case a Calumet & Hecla subsidiary, the St. Louis, would have new possibilities, and many other explorations would be started. The management of this property has been compelled to do its work slowly and with many handicaps, but has continued, in spite of natural disadvantages, to work out its theory along the only lines practicable.

The Seneca is going ahead with the opening of the Kearsarge lode and is considered to have a promising future. It is accumulating a small stockpile and getting the shaft down to the third level. In the meantime plans for the new stamp-mill will be undertaken in the spring. The stock-pile accumulation will be milled at a customs plant whenever it reaches proportions that warrant a mill-head operation. Hancock Con. opened again on October 20 with four machines at work developing the Pewabic lode south of the shaft. More machines will be added each day until the total working force reaches 200. The drills will be put to work with the idea of opening up the lode in as many places as possible, so that when hoisting starts it may continue uninterruptedly on a basis of large production. This is the only possible solution of the Hancock problem.

The Concord is the name of the consolidated New Baltic and New Arcadian properties. These companies hope to be able to finance future operations by means of stock which may be sold from the treasury. Arrangements for marketing this have been made with Eastern brokers. While the total amount of money expended in the work in this immediate vicinity has been large and the results attained have been unsatisfactory, there is, nevertheless, hope for success in the future. The Bear Lake property is another concern which is away from the recognized zone of mineralization, but the drill-cores showed good copper and the money has been raised in the East to back up further development. Michigan is another old property which has a chance of turning from a failure into a success in the near future. Michigan was the old Minesota in the early days of Ontonagon county development. It has one chance of making good now, that is, by doubling production. The Chicago, Milwaukee & St. Paul railway is building a spur into the shaft-house. The grading for this work will be completed in a week and rails ought to be laid by January 1 if the difficulty of securing the rails is obviated. Twenty-two machines are working in the shaft and every opening is in a grade of rock running 25 lb. at least in copper. Quincy is adding to its present equipment of Deister tables at the stamp-mill.

Representatives from 33 classes of the Michigan College of Mines attended a re-union at Maple Grove resort, Wisconsin, October 17, 18, and 19. William Kelly, president of the Board of Control and Fred Walter McNair, president of the College, gave addresses.

The students organization of the Michigan College of Mines elected officers as follows: president, R. G. Satterley; first vice-president, Lester Vocke; second vice-president, W. J. Kline; third vice-president, H. C. Blake; secretary, J. M. Flannigan; treasurer, James T. Fisher. The college has the largest freshman class in 15 years.

NEVADA

DEVELOPMENTS AT THE EUREKA CROESUS.—LABOR SITUATION IN TONOPAH AND DIVIDE.

EUREKA.—The Mining & Development Corporation, the new owner of the Richmond-Eureka Mining Co., is reported to be prepared to spend \$1,000,000 in re-opening the Eureka Consolidated and Richmond mines, which have been idle since 1910, when a production of 150 tons of silver-lead ore daily was discontinued owing to the suspension of operations by the Ruby Hill railway following a bad wash-out. It was estimated at that time that there was 1,500,000 tons of ore of shipping-grade exposed in the two mines. Among the stockholders in the Richmond-Eureka were Henry C. Frick, of the U. S. Smelting, Refining & Mining Co., John H. Mackenzie, William Fries of San Francisco and of the Charles Fries estate of New York. The mines were discovered in 1864, five years after the Comstock was found; one of the stockholders of those days was John W. Mackay. The production to 1910 is estimated at \$70,000,000.

Ore assaying \$200 in silver, lead, and gold is exposed for the width of a drift in a new discovery made on the 400-ft. level of the Dunderberg workings of the Eureka Croesus and a 45-ft. cross-cut is still in ore. The winze from this level, south of the old workings, is 285 ft. deep and is being continued in ore assaying over \$100. A 4-ft. width of ore assaying \$125 has been opened in a drift being driven north on the 200-ft. level and in a shallow winze from the west drift on the same level ore assaying 100 oz. silver, 15% lead, and $3\frac{1}{2}$ oz. gold has been cut. The west drift has been in ore of shipping-grade for 35 ft. and is being continued to open heretofore unexplored territory. A 160-hp. engine, 12-drill compressor, and a hoist are due to arrive in a short time and will be erected at the Catlin shaft, which will then be sunk 400 ft. more to a depth of 800 ft. and exploration started from the bottom for the extension of the ore-shoots opened on the 400-ft. level.

GOLDFIELD.—The south-east cross-cut on the seventh level of the Florence has been driven 155 ft. from the south drift. The west cross-cut on the same level has been driven 290 ft. into the foot-wall of the vein. A direct charge of \$6.30 per foot is being made against this work, which, with overhead charges, makes a total cost of \$10 per foot. The south-east cross-cut when complete will be 1200 ft. long; it is estimated that the total cost will reach \$15,000. This cross-cut will be driven south-east to a short distance west of the Aurelia lease shaft in the Cornishman claim and then will be turned south into the leased Golconda claim of the Red Hill. The west cross-cut will have to be driven nearly 500 ft. to

reach the boundary line of the leased Combination No. 2 claim of the Development company, and may be extended several hundred feet into the claim before driving is started. The Florence Divide lease is increasing the rate of shipment. Returns on the eighteenth, nineteenth, twentieth, and twenty-first cars sent to the smelter give a tenor respectively of \$342, \$61, \$103, and \$146 per ton. Preliminary estimates put a per-ton valuation of \$130, \$83, and \$50 on the next three cars shipped. Eleven lessees are developing blocks, all with exception of the Florence Divide on a small scale. J. B. Witt, who, with C. W. Brandon, discovered the Florence Divide ore-shoot, has taken a lease south of the old Riley block and is working at a depth of 258 ft. Adamson, Traynor, and McCall,

following a settlement of the strike under which miners receive \$5 and craft men \$5.50 per day, the same wages as were paid by the company before the walk-out. The board charge was fixed at \$1.25 per day, a gain of 25c. for the strikers. According to F. Sommer Schmidt, manager for the company, the main issue was the right to refuse to re-employ strikers at the discretion of the management, which was won by the company in the negotiations conducted through Robert F. Cole, State Labor Commissioner. The Copper Canyon is controlled by the Whicher interests of New York.

DIVIDE.—During the past week the labor situation showed marked improvement in both Tonopah and Divide and no further trouble is feared pending the de-

VIRGINIA CITY AND THE MINES OF THE COMSTOCK LODGE

leasing near the Nevadan shaft, the farthest north in Florence ground, are saving ore breaking \$27 with assays as high as \$387 being obtained from a narrow vein. J. B. Kendall, former manager for the Consolidated, has four miners employed in driving raises on the 258-ft. level near the east side-line of the Cornishman claim. A car-load of ore estimated to be worth from \$40 to \$50 per ton is broken in the Dorsey lease. In a raise from a 90-ft. cross-cut at a depth of 420 ft., 10 ft. of ore assaying \$9 has been opened in the Cracker Jack. The vein, dipping east at an angle of 45°, was cut 25 ft. above the cross-cut, which is from the bottom of a 100-ft. winze from the 320-ft. level. The cross-cut is being continued and is expected to enter the vein within 40 ft. Drifts are being driven north and south from the top of the raise, the face of the former assaying \$12 and the latter \$17. In a cross-cut from the 60-ft. point in the winze in August, 8 ft. of ore assaying \$25 was opened. The work is being done in the Columbia Mountain fault, far north of the proved zone in the Goldfield district.

COPPER CANYON.—Miners and craft men employed by the Copper Canyon Mining Co. have returned to work

mand expected within a short time from the newly organized Tonopah-Divide Miners' and Millmen's union. What will be embodied in this demand is not known, but it is believed a settlement will be made for a 50-cent increase in wages. It is reported that the Divide operators are willing to pay increased wages, but the situation is confused in Tonopah, where some of the companies are paying the way of miners into the district. It is reported that Governor Boyle and George Wingfield, one of the principal Divide operators, are to hold a conference within a few days. The governor is now in Ely, where it is reported the I. W. W. is trying to cause labor trouble. The injunction against I. W. W. activities in Tonopah and Divide has been made permanent. This is said to be the first instance in which a State has fought the I. W. W. to complete defeat in the courts.

ARROWHEAD.—Many locators in the new Arrowhead district, in Nye county north-east of Tonopah, are developing their claims with good results. The ore is silver sulphide and is found in well-defined fissure veins. The Arrowhead Mining Co., controlled by Tonopah men, has sunk where the original discovery was made a shaft

that is 175 ft. deep. In lateral work at 100 and 175 ft. high-grade ore has been exposed. In a drift on the 100-ft. level 3½ ft. of ore assaying \$32 in gold and \$199 in silver is exposed, according to J. B. Kendall of Goldfield, who recently inspected the district. Rich ore has also been opened at three places on the 175-ft. level and at this depth a 20-ft. cross-cut has failed to disclose the width of the vein.

UTAH

PRODUCTION FOR 1919.—LEGAL DECISIONS.—DIVIDENDS.—
GENERAL NEWS.

SALT LAKE CITY.—For the first nine months of this year, Utah mines distributed a total of \$8,172,320 in dividends, as compared with \$19,000,000 and \$29,000,000, respectively, for the same periods in 1918 and 1917. This heavy decrease is due to the unsatisfactory condition of the metal markets during the period, which resulted in practically all of the larger mines curtailing their operations, or closing down completely. Of the above total, Utah Copper leads with \$7,318,000; Tintic Standard, \$282,000; Bingham Mines, \$111,000; Eagle & Blue Bell, \$90,000; Daly Mining, \$67,000; Judge M. & S., \$60,000; South Hecla, \$39,525; Iron Blossom, \$25,000; Grand Central, \$24,000.

Probably the most pleasing item of news to come over the wires for some time was the announcement during the past week that the A. S. & R. company had increased the price of lead from 6¼ to 6½ cents per pound. While the advance is not great, it is encouraging to local lead-mining men, as Utah produced in 1918 about 167,000,000 lb. of the metal. The advance of ½ cent, based on the above production, means an increase of practically half a million dollars in the State's mineral output, and with the increased price of silver will probably do much to stimulate mining in a number of districts almost forgotten.

In the case of the United States v. the Silver King Consolidated Mining Co., which has been on trial before the United States District Court in this city, a directed verdict in favor of the defendant was given to the jury by United States District Judge Tillman D. Johnson. The Government sought to collect income tax on approximately \$640,000, which was paid to the defendant as a judgment, for ore extracted, by the Silver King Coalition Mines Co. in 1913. The mining company contended, in the argument for a directed verdict, that the claim on which the judgment was paid was owned by the company at the time of the incorporation of the company in Utah in 1908 and, therefore, not income subject to tax under the income tax law in 1913. Local officials of the Internal Revenue Department will take the question up with the Collector of Internal Revenue at Washington regarding an appeal of the case.

The fall semester at the University of Utah began on September 29. At the present time there are 275 students in the School of Mines and Engineering Departments. This is the largest attendance ever recorded.

After having been dormant for six years, 'Mines and

Methods' made its reappearance on October 17. It is stated that the paper soon will be changed from a monthly to a semi-monthly publication, and ultimately will be issued once a week.

Announcement has been made that the United States Bureau of Mines will send to Utah a geophone to be kept permanently in this district. This news was made public by Carl A. Allen, engineer for the Bureau and Chief Mine Inspector for Utah, who has just returned from a trip to Pittsburgh and Washington, D. C. The geophone is an instrument which attained a highly developed stage during the late war, and is now being turned to peace uses. Its principal use is detecting the location of sounds underground; such as rapping by entombed miners, and the grinding of diamond-drill bits or the noises of air drills, in approaching headings, such as tunnels. The geophone is a good deal like a physician's stethoscope, and one inventive genius has found that it can be used for detecting the 'knocks' in an automobile engine. Underground, in hard rock, sounds have been detected by the geophone at a distance of 1500 ft. Sounds traveling 1200 ft. through coal have been noted. The geophone is practically indestructible, and could be dropped down a raise from a height of 100 ft. without being hurt.

The United States Supreme Court, on October 20, issued a writ of certiorari to the Silver King Coalition Mines Co. in the case brought against it by the Conkling Mining Co., and the case will be set for trial before the highest tribunal in the country. The case was appealed to the Supreme Court after judgment had been awarded the plaintiff to the amount of \$570,000. The United States District Court in Salt Lake City had first decided in favor of the defendant, but after the decision had been reversed by the Court of Appeals and returned to the local jurisdiction, judgment was given the plaintiff. Issuance of the writ means that the case will be given its final hearing before the United States Supreme Court.

PARK CITY.—For the first nine months of the current year, Park City shipments of ore totaled 54,933 tons, valued at \$3,100,000. The Judge M. & S. Co. shipped 17,420 tons; the Silver King Coalition, 14,687 tons; the Ontario Silver, 14,339 tons; the Daly-West, 3386 tons; the Naildriver Mining, 2024 tons; the Daly Mining, 2328 tons; the Silver King Consolidated, 710 tons; and the Iowa Copper, 44 tons. Of late, all mines have been increasing their output, due to the advance in lead quotations and the high price of silver. Shipments of ore for the week ended October 17 were as follows: Silver King Coalition, 666 tons; Ontario Silver, 551 tons; Daly Mining, 159 tons; Daly West, 404 tons; Judge M. & S., 331 tons; Naildriver Mining, 58 tons. Labor conditions are satisfactory; all mines reporting plenty of men and a gradual increase in efficiency.

The State Board of Equalization, which has been investigating and examining properties in the Tintic district for assessment purposes, has been in this district during the current week looking over improvements and equipment on mining property here.

Physical conditions of an encouraging and interesting

nature are being encountered in the development which is being done at the Three Kings mine, according to P. J. Mackintosh, general manager. The most important work at present is the sinking of a winze upon the ore in fissure No. 4. This winze will be sunk until the quartzite-lime contact is encountered. Ore is being taken from the raises, and there is a carload en route to the smelter.

TINTIC DISTRICT.—Shipments of ore from forty mines in the Tintic district for the first nine months of the present year are estimated at 5197 carloads, or approxi-

the shaft reaches the 1500-ft. level, extensive prospecting will be taken up. This property is now the second largest silver producer in Utah.

After re-timbering and repairing the shaft of the Yankee Consolidated Co., fixing up stations and cleaning out drifts, work has been taken up in behalf of both the Yankee and May Day companies. Some time ago the May Day company made arrangements for a campaign of deep work to be handled through the Yankee shaft at a depth of 1800 feet.

Officials of the Grand Central Mining Co. state that

THE UTAH-APEX LEAD MINE, BINGHAM DISTRICT, UTAH

mately 250,000 tons, valued at \$7,500,000. The output during September was 499 carloads. The principal shippers from the district, for the period above mentioned, were as follows: Dragon, 894 cars; Chief Consolidated, 872 cars; Centennial-Eureka, 334 cars; Iron Blossom, 553 cars; Colorado, 326 cars; Eagle & Blue Bell, 314 cars; Tintic Standard, 688 cars; Mammoth, 238 cars; Grand Central, 282 cars; Gemini, 135 cars; Empire Mines, 129 cars; Swansea, 100 cars; Ridge & Valley, 82 cars; Victoria, 57 cars; Gold Chain, 23 cars; Bullion-Beck, 28 cars. For the week ended October 17, shipments from the district totaled 114 cars, a decrease of 15 cars, as compared with the previous week.

Work of sinking the south shaft at the Tintic Standard Mining Co.'s property was taken up recently by contractors who have undertaken to sink the double compartment shaft to a depth of 1500 ft. The present depth of the shaft is 1050 ft. This sinking is preliminary to the development of the south end of the property. As soon as

the mine is looking exceptionally well at the present time, and that considerable new ore is being opened up. The advance in the price of silver is helping to some extent, although Grand Central ore also carries gold and copper.

The contract for sinking a shaft at the property of the Tintic Paymaster Co. has been awarded to Duncan & Moore, contractors of Eureka. The shaft is now at a depth of 340 ft., with a flow of water coming into it at the rate of 40 gallons per minute. It is planned to bring this water to the surface, where it will be of great value to the company.

The directors of the Iron Blossom Co. have declared a dividend of 2½ cents per share, or a total of \$25,000, payable to stockholders on December 25. This will bring dividends for the current year up to \$50,000, and the grand total to \$3,260,000. Conditions at the mine are encouraging, and the high price of silver is adding materially to earnings.

Officials of the Eureka Lily Co. report an east-west

cross fissure encountered on the 1700-ft. level. When first struck the fissure, which carries a good grade of ore with silver, lead, gold, and copper, was 18 in. wide, but within a few feet of sinking it has widened to 3 ft. Physical conditions in the south drift from the main shaft of the 1665-ft. level indicates that the quartzite-lime contact is being approached. The face of the drift, which is now 450 ft. from the shaft, is highly mineralized. When this contact is reached, it is expected that the Tintic-Standard ore zone will be encountered.

ALTA.—The South Hecla Co. has shipped approximately 6000 tons of ore since June 1. The September output was 1000 tons; August, 1500; July, 1700; and June, 1800. There are two grades of ore being shipped; silver-copper sulphide and lead-silver carbonate, with an average value of \$25 per ton. During the past quarter the company paid a dividend totaling \$39,450.

The Wasatch Mines tunnel is rapidly nearing the old shaft leading to the 400-ft. level. This shaft is filled with water for 200 ft., and as the tunnel approaches, is gradually being drained, so that mining may be resumed. The bore is now in a distance of 5080 ft., and is progressing at the rate of 8 to 9 ft. daily.

Through a deal which has just been closed for the control of the Copper King Co.'s claims in Big Cottonwood canyon, consisting of seven patented claims, the Big Cottonwood Coalition Mines Co. rounds out the largest property in the camp, having a total of 61 claims and fractions. By this deal the Coalition company adds 160 acres to its territory. Contract has been let for 400 ft. of additional work in the tunnel, which will carry it to the junction of the Cooper, Copper King, and Prince of Wales veins. The face of the tunnel is now in 2155 ft. Shipments from the Copper King, about a year ago, averaged 0.1 oz. gold, 2.5 oz. silver, 4.0% lead, and 6.85% copper.

BINGHAM.—Mining operations have been resumed at the Utah-Apex property. The mine, for several years past, has been the largest lead producer in the State, and one of the largest silver producers. The annual production of lead for a five-year period has averaged between 45,000,000 and 50,000,000 lb., and of silver, about 650,000 oz. The recent advances in the prices of these metals has assured the company a fair comfortable profit on its 528,000 shares. Last April, owing to unsettled metal market conditions, operations were suspended. During the summer, a force of from 60 to 100 men was kept on development work, the results of which are highly gratifying to the management. At the present time, about 200 tons of ore are being shipped to the smelter daily, and with the new and enlarged hoist, together with betterments for the more efficient handling of ore from all levels through the installation of pockets and better dumping facilities, production can be pushed up to 1000 tons per day. The management hopes to have it up to 500 tons per day before the snow flies. At present the company has about 300 men, but could use twice that number. Efficient miners are scarce at all mines here.

It is reported that the Jesse Knight interests of Provo

recently closed a deal for the purchase of the Black Diamond group of ten claims adjoining the Bingham-Empire holdings at Bingham, and lying immediately south of the Bingham-Tooele group, thus giving them 2000 acres of promising mining ground. The Bingham Empire property has been owned by the Knight interests for a number of years, but very little work has been done for some time. It is reported that the Knights intend to explore the property with diamond-drills and to start an extensive development campaign to determine its value as a mining project. The ground is in the immediate vicinity of the Utah Metal & Tunnel and is thought to have excellent possibilities.

BRITISH COLUMBIA

WORK AT COPPER MOUNTAIN.—DISCOVERY AT COTTONWOOD CREEK.

PRINCETON.—An outline of what has been done and what is planned by the Canada Copper Co. in the development of the large low-grade orebodies of Copper Mountain, was given recently by H. R. Van Wagenen, general manager for the company, before representatives of the Boards of Trade of Vancouver and Princeton. Describing the ore of the company's new property as being not dissimilar to that of the Hidden Creek mine, Anyox, and of the Britannia Mine, Howe Sound, Mr. Van Wagenen said that all the plant and equipment essential in the economical treatment of such low-grade ore had been provided. A spur railway had been constructed connecting the mine with the Kettle Valley Railway Co. and the West Kootenay Power & Light Co. was to put in a line for the transmission of power for operation. Labor conditions had interfered with the construction of the railroad, but it now was well under way and as soon as completed the recovery of ore would be started. The power-line came in over 105 miles from Greenwood and 165 miles from Bonnington Falls, the source of the power. The necessary equipment was on hand for the mill to be operated at Allenby. The site of this plant was 5.5 miles from the town of Princeton and 7.7 miles from the mine. Mill construction would mean an investment of about \$1,000,000 and the installation would permit the handling of 2000 tons of ore per day. Units were prepared in such a manner that a daily treatment of 5000 tons could be arranged for with little additional expense. Already the company, in preparation for the opening and the placing of its mine on a productive basis, had spent some \$2,500,000, and there was no doubt that the aggregate investment, before all work was complete, would run to \$3,500,000. With the outlay of the Kettle Valley Ry. Co. and that of the West Kootenay Power & Light Co. the investment, when the enterprise was in shape to commence making returns, would aggregate approximately \$6,000,000. At the mine employment would be found for between 400 and 450 men. These, with their families, for whom houses were to be built, would constitute a new town of about 700 people. At Allenby the mill would require from 100 to 150 men. As a rule

mill-men stayed steadily in one place, settling down with their families, so that it might be expected that this would mean another town of some 400 inhabitants. Copper products, at the present market, would amount to about \$18,000 per day. There was a tonnage of 10,000,000 in sight, with an additional 2,000,000 semi-proved, added to which there would be ore at depth. The ore could be dealt with on the gravity system as the tracks and tunnels were below the lowest known ore. This ore would be run down to the mill and the resultant product

TRIUNE PASS, NORTH-WEST KOOTENAY, BRITISH COLUMBIA

probably would be sent to the Trail smelter of the Consolidated Mining & Smelting Company.

TRAIL.—An appeal was argued recently before the Supreme Court of Canada which is of interest to the mining men of this Province, the principals being the Consolidated Mining & Smelting Co. of Canada and Endersy, a farmer in the Trail smelter district. This action was brought by Endersy against the company for damages claimed to have been done to his farm, crops, and timber by the smoke from the Trail smelter. The case originally was tried before a special jury which found for the plaintiff, the verdict awarding the latter \$2170. The company appealed to the British Columbia Court of Appeals, which upheld the judgment of the lower court. The case then was carried to the highest Canadian court with the same result, the appeal being dismissed with costs.

CARIBOO.—A cable advice states that the Privy Council has given a verdict in favor of R. T. Ward in the case of Hopp v. Ward, thus giving the Bullion mine and equipment, near Quesnel Forks, to Ward. The placer prop-

erty, consisting of 1260 acres, was originally taken up by Van Horn, Shaughnessy, Matthews, Osler, and other C. P. R. officials, who spent \$3,500,000 in development and equipment. In 1906 the syndicate sold the property to the Guggenheims, who incorporated the Cariboo Gold Mining Co., which spent over \$500,000 in further development and equipment. There are over 50 miles of canals and a number of dams and reservoirs on the property. In 1913 the company sold to R. T. Ward, of California, and ten days after Ward took possession the property was 'jumped' by John Hopp, on the technical ground that under the Mining Act it had been abandoned as a miner's license had not been renewed. Hopp applied for and obtained eleven leases, covering all the improvements. The case came up before the executive council twice in 1916, and a decision was given in favor of Hopp. The Quesnel Forks Gold Mining Co. was formed and took over the property. Ward took the case to the Supreme Court, which decided against him, but the decision was reversed in the Court of Appeal. The Hopp interests took the case to the Privy Council, which decided in favor of Ward. The litigation has cost Ward \$15,000, only about a sixth of which he expects to recover from the losers.

VICTORIA.—W. M. Brewer, resident engineer for the district, who has been examining the mines in the vicinity of Cowichan lake, Vancouver island, reports the discovery of ore having a total value of \$105 per ton on the Service property at Cottonwood Creek. The Consolidated company has sent an engineer to examine the property with a view to bonding it. A 50-ft. shaft has been sunk on the Lenora property by G. B. D. Turner, of Butte, and New York associates. Mr. Lavensaller and associates are developing a belt of schist carrying low-grade copper ore on Mount Brenton, on the opposite side of the river to the Lenora mine. The company is applying for the water right of the whole of the Chemainus river. Hill 60, the property of British Columbia Manganese Co., is developing well, and making regular shipments to Tacoma, where the ore is used for the manufacture of ferro-manganese. A number of discoveries of magnetite are reported.

ONTARIO

COBALT, PORCUPINE, KIRKLAND LAKE.

COBALT.—During the week ended October 17 shipments of ore amounted approximately to 1,164,505 lb., of which 729,645 lb. was from the Nipissing. This was the highest weekly shipment from that mine for several months. Litigation involving the ownership of the Bailey mine, which has been in progress for over five years, has been terminated by the acceptance of an offer by A. J. Young to purchase the assets and merge them with those of the Northern Customs Concentrator in a new company, to be known as the Bailey-Northern Customs, Ltd. The Bailey shareholders will receive stock in the new concern in exchange for their present shares. At the Beaver a vein 9 in. wide reported to carry 4500 oz. per ton has been encountered on the second level, and a 2-in.

vein of equal grade has been struck on the sixth level. The wall-rock in both cases is good milling-ore. An official statement as to the result of exploration work on the Gans property of the Temiskaming mine is to the effect that the 3-in. vein occurring above the 500-ft. level is of uncertain character, showing patches of rich ore alternating with barren parts. A body of good milling-ore has been encountered in the older workings at the south end of the 575-ft. level. The Kerr Lake during September produced over 60,000 oz. of silver, indicating a quick recovery from the effects of the strike.

On October 16 the Prince of Wales visited Cobalt and received a most enthusiastic welcome, the whole population turning out to greet him. He inspected the Coniagas, O'Brien, McKinley-Darragh, and Kerr Lake mines, and the refinery of the Mining Corporation of Canada.

PORCUPINE.—At the Davidson four shafts are down. Two on the original property have reached a depth of 600 and 300 ft. respectively, and one of the properties recently acquired has a shaft down 130 ft., a cross-cut from which has opened up a good orebody. A small test-mill is treating development ore with satisfactory results. The big orebody at the 500-ft. level has been driven on for a considerable distance. The Boyce group of claims, comprising 160 acres adjoining the Hollinger Consolidated on the East, has been secured by Toronto, Hamilton, and Montreal capitalists, who will form a company to be known as the Gold Centre Mines, Ltd., capitalized at \$3,000,000. At the outset 5000 ft. of diamond-drilling will be undertaken to cut the veins at a depth of about 500 ft. at several points where geological maps indicate a contact between the quartz-porphyry and the Keewatin. B. M. Walton has been appointed manager. The Northwoods Mining Co. of New York, which has 53 claims in Tisdale township, has done 1200 ft. of diamond-drilling with a view to cutting the vein system of the Hollinger; it is understood that the results have been satisfactory and that development will be undertaken. C. B. Morgan is in charge.

KIRKLAND LAKE.—The miners strike was called off on the 15th and the men have returned to work. The Lake Shore has secured a sufficient force to operate at full capacity. The Teck Hughes has employed a large number and will shortly be in a position to equal or surpass its previous record. The situation generally is satisfactory and encouraging.

SONORA

NEWS FROM EL PROGRESO.—GOOD ORE DISCOVERED ON THE SANTANA.

EL PROGRESO.—El Progreso Silver company has completed a trucking road from its property 100 miles south of Nacozari to the Nacozari railroad and hereafter will ship over that line to Douglas, instead of over the Southern Pacific, through Nogales. A fleet of trucks owned by the company will be used to haul supplies to the mine and the concentrate and cyanide precipitates to the railroad. The concentrates are sent to the El Paso smelter while the precipitates are expressed to Perth Amboy,

New Jersey, for refining. The company's new 100-ton mill went into operation the latter part of October. The ores of the property are highly silicious, and contain silver and gold. Both concentrating and cyaniding are in use. The average tenor of the ore in silver and gold is about \$30 per ton. The mill recovers approximately 90%. The property is being operated through two shafts; the old shaft has been sunk to a depth of 200 ft. with drifts on the 100 and 200-ft. levels. On both levels continuous ore-shoots, the limits of which have not been determined, have been opened. About 50,000 tons of ore has been blocked out. The new double-compartment shaft, equipped at the surface with a large steam-hoist, head-frame, and cage, has been sunk about 100 ft. It will be carried to a depth of about 500 ft. to explore the property. Drifts will be run at 100-ft. intervals into the territory where ore has been proved by the old shaft and workings driven on the veins to develop the orebodies. Ore from the various dumps now is hoisted to the crusher levels by means of an incline track. The collar of the new shaft is on a level with the crusher floor of the mill and ore will be trammed by hand 200 ft. to the mill. The property is surrounded by a plentiful supply of wood for fuel and timber, while an abundance of water has been developed for use in mine, mill, and for domestic purposes. El Progreso is under management of A. Macfarlane, assisted by five American department heads. Approximately 150 Mexicans are employed in the mine and mill. The nearest town is Batuc, Sonora. Labor conditions in the vicinity of the property are ideal at present.

MINA MEXICO.—The Mina Mexico, a silver property from which much high-grade has been shipped in the past, but for the last three years closed down because of revolutionary troubles, is expected to re-open in the near future. Chicago interests own this property. It is equipped with a mill and small smelter. The Mina Mexico lies in the foothills on the Sonora side of the Sierra Madre mountains, about 40 miles east of Batuc.

SANTANA.—A rich discovery of silver ore was made here recently by James V. Fryer, who is operating the Santana with a small force under lease from N. S. Finch. While driving a tunnel to get under old Spanish workings, an orebody was encountered, the extent of which has not yet been determined, but the richness of which cannot be doubted. The Santana, which lies near the San Nicolas mine in the southern part of the Moctezuma mining district, is an 'antigua', giving evidence of having yielded ore in the days of the 'Conquistadores' of Spain. Shallow workings and the remains of arastras in which the Spanish padres reduced the ore, still exist. The main vein, which is believed to have been uncovered by Mr. Fryer, was covered, it is believed by design, by the former exploiters of the ground. Mr. Finch is not at present in Sonora, being at Deming, New Mexico, making arrangements to start operations on silver properties in the vicinity of Kingston and Lake Valley, formerly large producers but closed down since the price of silver fell in the early '90's.

ARIZONA

Gunsight.—Jones, Greer, and Meyers of Miami have leased the 17 claims of the Yellow Aster Mining Co. It is the intention of the lessees to sub-lease some of the claims. A drift has been started in No. 6 shaft to connect with shaft No. 7, a distance of 300 ft. A cyanide plant is to be built. The Gunsight Gold & Tungsten Milling Co.'s mill, which was recently damaged by a cloudburst, is undergoing repairs. This company is also installing improvements to handle the increased tonnage of custom ore of the district. The company now has a lease on the old Gunsight well which will ensure an ample supply of water. Arrangements have been completed for sinking a 100-ft. shaft and some driving on the B. B. Extension property. This is a gold property.

Kingman.—The Catherine mine, situated 40 miles west of Kingman, in the Union Pass district has opened a large tonnage of high-grade gold ore on recent development. The shaft is now down 400 ft. and cross-cuts are being driven on the 300 and 400-ft. levels to prospect the vein upon which 300 ft. of driving has been done on the 200-ft. level. On this level it is claimed that 12 ft. of \$30 ore has been opened. E. C. Bradshaw has taken an option on the Diamond Joe mine. A considerable tonnage of ore is developed in the mine. The mine and dump ores are to be hauled to the Arizona Molybdenum mill for treatment, two miles away. The Dean mine, situated 15 miles east of Kingman, has been purchased by St. Louis interests. Captain Gibson, who is to be in charge of the property, contemplates the immediate erection of a mill to treat the 20,000 tons of ore at present developed. The shaft of the Senate silver property, which adjoins the Hackberry, is now down 200 ft. Since the first of the year mine buildings, compressor, gas engines, and hoist have been installed, sinking having commenced in July.

Prescott.—It is reported that the Philadelphia Mining Co.'s 3000-ft. tunnel has penetrated the orebody 700 ft. below the workings of the old 80-ft. shaft. The vein is 5 ft. wide and carries principally gold. A raise is to be started immediately to connect the old shaft. Development work has been under way for four years under the direction of G. P. Harrington.

G. M. Spicer and Associates of Los Angeles are reviving the old Perry silver mine of the Gold Blossom Mining Co., nine miles south of Prescott on the Hassayampa river. This property was prominent in the 'eighties, being a shipper to Colorado.

Tucson.—The southern part of the Amole district is the most active area in that district. Operations are being pushed both at the Arizona-Tonopah Mining & Milling Co.'s property and the Arizona-Tucson Copper Co.'s prospect. These properties adjoin the old Saginaw property on the east; this latter property was worked with success in the 'nineties. Since the first of the year the Arizona-Tonopah has installed power-house, dwellings, and the necessary power equipment for sinking the 9 by 4-ft. shaft to the 200-ft. level, at which point it is the intention of the management to cross-cut. The shaft is at present 73 ft. deep. Another prospect shaft is being sunk 1500 ft. north-west of the main shaft. This shaft passed through ore running 17

oz. in silver. The Arizona-Tucson Copper Co. is completing dwellings, mine buildings, installing a 20-hp. distillate engine for power and a 60-hp. Fairbanks-Morse crude-oil engine hoist. The new vertical shaft is down 30 ft. and sinking will be resumed on the completion of the head-frame and machinery installation. Over 200 tons of high-grade copper ore running high in gold and silver is now on the dump. This ore was taken from a small glory-hole at the surface near the old discovery shaft.

CALIFORNIA

Amador City.—The restraining dam of the Keystone Mines Co., spanning Amador creek, is being raised 20 ft., giving the restraining pond an additional storage capacity of approximately 1,500,000 tons. Operation of the mill has ceased pending improvement to the barrier, as sand has been flowing over the dam.

Downieville.—The main channel has been opened in the Wehe drift mine on St. Charles hill by a raise from the tunnel. Much water is present and a second raise is being driven to drain the channel. The gravel is good grade and will be mined through No. 1 raise.—Preparations are being made for extensive work at the Kate Hardy, formerly a good yielder of quartz-gold. The property lies on Oregon creek and is controlled by Will M. Beggs of San Jose.

Knob.—An orebody believed to be the Lucky Baldwin vein has been uncovered in the Midas mine of the Victor Power & Development Co. The vein is about 8 in. wide and shows high-grade ore. Four Gibson mills are running on ore from the Midas and Bull Moose properties of the Victor holdings.

Ono.—Arbuckle Mining Co. is adding five stamps to the five-stamp mill and preparing erection of several buildings. A road $4\frac{1}{2}$ miles long is under construction to the mine from the highway. The property, known locally as the Bell Cow, is attracting considerable attention as the result of discoveries of excellent mill ore.

Placerville.—H. G. Fairchild and R. Richards have begun operations at the Roundout gravel property, four miles north-east of Placerville. The property is equipped with an excellent plant, and deep gravel deposits are demonstrated. Considerable development work was performed last spring.

COLORADO

Silverton.—The following is the agreement and wage-scale that has been adopted by the Silverton Miners Union No. 26 and the mine operators of San Juan county. This is in force from September 1, 1919, to September 1, 1920.

1. Eight hours shall constitute a day's labor in and about mines, mills, smelters, and tramways.
2. Time and a half to be paid for overtime.
3. \$4.75 shall constitute a minimum day's wage.
4. For all classes of labor working in wet places where rubber clothing is required 50c. additional shall be added.
5. For sinking and raising 50c. additional shall be added.
6. Miners' Union secretary to be allowed to go to the different mines to collect dues.
7. Pay-day twice a month.

8. This scale shall be based on \$1.25 per day board.

NEVADA

Carson City.—Comstock Superior Co. reports discovery of a 10-ft. vein of \$23 silver ore 75 ft. from portal of tunnel. It is a blind vein and occurs at a depth of 50 ft. Tunnel driving continues in order to reach an orebody 30 ft. distant that assays \$40 per ton in silver and gold at surface. G. S. Clark, the manager, states that nine distinct veins occur on the property.—Another high-grade shoot sampling \$301 per ton has been intersected at a depth of 72 ft. in the Southwest Comstock Extension. It is 2 ft. wide. Thurman Roberts is superintendent.—Erection of foundations for an electric hoist and 75-hp. compressor is proceeding at the Mighels group, operated by Nevada Protective Mining & Investment Co. E. R. Argersinger, the manager, states a 400-ft. vertical shaft will be sunk and drifts extended to known veins. San Francisco and Oakland people are chiefly interested.

National.—The Forrest Bell lease on Buckskin National has uncovered high-grade gold-silver ore, according to the management. The richest ore assays \$20 to \$50 per pound and a shipment, estimated at \$1000 per ton, has been made to a customs smelter. W. I. Bell, the manager of the parent company, states 3500 ft. of development work has been accomplished, including a 400-ft. shaft. Good ore has been exposed at many points, with several leasing companies prepared for production.

Personal

The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

D. C. Jackling is in New York.

Gilmour E. Brown is in Scotland.

Samuel Newhouse is at Salt Lake City, from New York.

J. M. Callow has returned from New York to Salt Lake City.

H. F. Bain is in the Malay States, inspecting alluvial tin mines.

D. W. Leeke has returned from Korea and Japan, on his way to Mexico.

Wilton Shellshear has returned from Tezuitlan, Mexico, to San Francisco.

Charles T. Hutchinson, business manager for the 'M. & S. P.', has returned from New York to San Francisco.

Olaf P. Jenkins has resigned from the Arizona Bureau of Mines to undertake geological work in foreign countries.

F. W. Bradley has returned from Alaska. On his way back, he visited the Bunker Hill mine, at Kellogg, Idaho.

Edward H. Watson, manager for the Olekma & Vitim Gold Syndicate, passed through San Francisco on his way from Siberia to London.

Victor C. Heikes and **B. S. Butler**, of the U. S. Geological Survey, were recently at the Tintic Standard mine in East Tintic district, Utah.

T. M. Daulton, general manager for the Placer Gold Mines Co., at Atlin, B. C., has gone to Manila, P. I., to exploit some placer deposits.

Henry S. Lyne has accepted the position of mill superintendent for the Iron Mountain Limited lead-silver-zinc properties, at Salmo, British Columbia.

Louis A. Wright sailed on the 'Canopic' for Italy from New York on October 22, to take up professional work; his address will be Parlamento 22, Rome.

Thomas F. Donnelly left New York on October 20 for South America, where he will examine properties in Chile, Bolivia, Peru, and Brazil. He will be gone about eight months.

R. C. Gemmell, assistant managing director of the Jackling copper enterprises, has returned to Salt Lake City after inspecting the Ray and Chino properties in company with **D. C. Jackling**.

George W. Starr has been elected president of the California Metal Producers Association. **Edwin Higgins** was selected as delegate to the Association to the convention of the American Mining Congress.

C. B. Lakenan, general manager for the Nevada Consolidated Copper Co. at McGill, Nevada, was at Salt Lake City on October 20. On the 21st he left for Chicago, accompanied by **E. W. Engelmann**, on company business.

Clarence E. Allen, general manager of the Utah Department of the United States S., R. & M. Co., has returned from Eureka, Nevada, where he went to inspect the development work being done by the Eureka-Croesus company.

R. T. Walker has resigned as superintendent of the Virginia-Louise Mining Co. at Pioche, Nevada, to accept the position of manager of the Ore Purchasing Department of the United States S., R. & M. Co., at Salt Lake City, Utah.

Edward W. Berry and **Joseph T. Singewald, Jr.**, professors of geology in the Johns Hopkins University, have returned from their six months geologic studies in Peru, Bolivia, and Chile, which were conducted through the George Huntington Williams Memorial fund.

THE METAL MARKET

METAL PRICES

San Francisco, October 28

| | |
|--|-------------|
| Aluminum dust, cents per pound..... | 65 |
| Antimony, cents per pound..... | 9.50 |
| Copper, electrolytic, cents per pound..... | 21.50-22.00 |
| Lead, pig, cents per pound..... | 7.00-8.00 |
| Platinum, pure, per ounce..... | \$140 |
| Platinum, 10% iridium, per ounce..... | \$160 |
| Quicksilver, per flask of 75 lb..... | \$85 |
| Spelter, cents per pound..... | 9.50 |
| Zinc dust, cents per pound..... | 11.00-13.50 |

EASTERN METAL MARKET

(By wire from New York)

October 28.—Copper is inactive but steady. Lead is active and strong. Zinc is dull and unchanged.

SILVER

Below are given official or ticker quotations, in cents per ounce of silver 999 fine. From April 23, 1918, the United States government paid \$1 per ounce for all silver purchased by it, fixing a maximum of \$1.01½ on August 15, 1918, and will continue to pay \$1 until the quantity specified under the Act is purchased, probably extending over several years. On May 5, 1919, all restrictions on the metal were removed, resulting in fluctuations. During the restricted period, the British government fixed the maximum price five times, the last being on March 25, 1919, on account of the low rate of sterling exchange, but removed all restrictions on May 10. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the normal rate of exchange.

MONEY AND EXCHANGE

A recent event of importance was the announcement of arrangements for flotation of a new \$250,000,000 British loan on this side, about half of which will be available as a force toward sustaining British credit here. Measured in amount, this may not seem a very potent factor in relation to the dimensions of the whole exchange problem, but the sentimental and perhaps the prophetic influence is considerable. The same influence is contained in hope of further financing to improve French credit.

The British loan's new feature is a virtual call on sterling exchange through the privilege of conversion into war bonds at a fixed rate of \$4.30 for the pound. Sale of war bonds at par would realize amounts varying from par at the rate fixed to as high as 113.19 should exchange recover to its own par of 4.86. Held to maturity, the bond would yield from 105 at the fixed rate to 118.55 with sterling back to parity. As the new loan will net only about \$115,000,000 new money, its effect remains rather sentimental than actual. Its significance is perhaps chiefly that of a precursor of general improvement to come in the exchange situation as treaty ratification draws nearer, and a wider emphasis is put on the theme of credit extension. The latest remarks of Mr. Lamont, the utterances at Atlantic City, and the reporting of the Edge bill to the House, with favorable action likely next week, are all straws in this direction.

Reporting to the Investment Bankers' Association convention at St. Louis, Thomas W. Lamont, of J. P. Morgan & Co., chairman of the foreign securities committee, referring to the foreign credit, said in part: "Much has appeared in print as to necessity of extending credit to European countries, but few steps have been actually taken. Extension of credit abroad implies purchase of foreign securities, government, private, or both, by American investors. As a whole, this country has not yet awakened to the necessity of extending credit to maintain America's export trade. We talk glibly of the necessity of extending credits to Europe, in order to assist good customers who, in the last five years, have, together with other foreign markets, brought \$26,000,000,000 worth of products from America.

"We then straightaway forget all about it. 'Passing the buck' is the slang phrase that describes the situation. Some say—'Let the bankers extend the credit,' as if bankers, who must return on demand the money deposited with them, had any right to tie that money up in long-term loans! Other people seem to think extending credit to Europe is purely a technical matter, having to do with Wall Street or foreign exchange.

"Extension of credit, rendering help to Europe, is a work for every thrifty and solvent citizen of the United States. If we don't do our share, nobody else will. Europe wants to buy wheat. Our farmers have wheat to sell. The farmers must sell that wheat on credit; not all on credit, but a reasonable share. The farmer will extend that credit, not as to a single shipment of 100 bushels, but through investing in a thousand dollar bond of some solvent European country that may offer her promise to pay for sale here, so that with the credit she establishes her people can buy American wheat. The same applies to all manufacturers, to all merchants. If Europe is to be fed and clothed, to continue the excellent customer she has been, we must all get into the same co-operative frame of mind."

Quotations on October 28 are as follows:

| | |
|-----------------------|-------|
| Sterling: Cable | 4.18% |
| Demand | 4.17% |
| France: Cable | 8.58 |
| Demand | 8.60 |
| Live: Demand | 10.56 |
| Marks | 3.40 |

Eastern Metal Market

New York, October 22.

The markets are more active except for copper, and prices have advanced in most cases, copper being the only metal that has reacted.

Buying of copper has fallen off again, after fairly good buying due to a reduction in prices by the large producers, which satisfied present needs.

Spot tin has advanced, as well as tin ex-steamer at docks, because of the longshoremen's strike in New York harbors.

The lead market is active and higher, the leading interest having advanced its price.

Demand for zinc for export via Gulf ports is active and prices are higher in general.

Antimony is a little stronger.

IRON AND STEEL

Production has increased in both pig-iron and steel the past week and the steel output is now up to a 60% basis, full operation being practically recorded in the Pittsburgh district and eastern Pennsylvania. The scarcity of common labor is a drawback even in the Pittsburgh district. Consumers are not pressing for steel, but as the strike comes to a close premium offerings are expected. Sales of malleable iron are the leading features in the pig-iron market. For 22,000 tons of plates for the Navy, the leading Pittsburgh producer bid 2.50c. per lb. and 2.40c. on 6800 tons of structural shapes, but 2.65c. and 2.45c. continue the ruling prices on these products. An Eastern mill has advanced its price $\frac{1}{2}$ c. per lb. on alloy steel bars and \$15 per ton on alloy steel billets. October business in fabricated steel has fallen off sharply.

COPPER

The situation in this market is a complex one and has undergone quite a change in the week. Late last week the large producers of electrolytic copper, who have steadily and finally held their price at 23.50c., New York, for many weeks, reduced their quotations—at least one or two of them did. The result is understood to have been that several did a fair business at levels considerably under this and that most of the rest followed suit. As a result today it is said that most of them are quoting about 22c. for electrolytic for early or last quarter delivery. The outside market, which had advanced a week ago to 22c. to 22.50c., is now relatively lower or around 21.50c., New York. This market may be quoted conservatively at around 21.75c., New York, for electrolytic and 22.25c. for Lake, with demand light. The fairly good buying a week ago has apparently cleaned up most outside lots and satisfied the present needs. Consumers are marking time, due to the sudden change in front of the large producers, and very little buying is just now in evidence.

TIN

As a whole the tin market has been a quiet one the last week. Most of the business done has been in prompt metal out of store at stiff premiums. Spot Straits, New York, has sold as high as 56.50c., which we quote as the market. The next most active position has been from steamers now at dock, the tin not being available in most cases because of the longshoremen's strike. This metal has sold up to 56.50c. There has been an active demand for prompt tin, which at the closing on Monday was 56.75c. to 57c. asked. Tin ex-steamer Mesaba sold as high as 55c., with 55.50c. asked at the close Monday. There has also been a fair business in metal for prompt shipment from London with prices up to 54c. For November-December shipment from the Far East some business is reported at 53.75c. This low

level was attractive to some buyers. Last Monday was the most active day of the past seven or eight days. The presence of United States troops at the docks and in New York may affect the present tense situation so as to force down the price of prompt tin ex-store and advance that of tin ex-steamer at dock. American 99% tin sold at 54.50c. last week and 55.25c. is now asked. American pure tin is quoted from one source at 55.50c. Tin arrivals to date are reported to have been 5265 tons, of which only 100 tons has come in at Pacific ports. There are 5105 tons reported afloat. The London market is firm with spot Straits quoted at £281 5s. per ton.

LEAD

Demand has been good and also greater than the supply. On October 16 the American Smelting & Refining Co. advanced its price from 6.25c. to 6.50c., New York, but this was not generally known until the next day, October 17. Previous to this the outside market had nearly reached the higher level. The advance by the leading producer was not entirely unexpected. The higher prices are largely the result of inability of consumers to get their lead because of strikes which have resulted in some competitive bidding for that available. Spot lead has been sold at New York up to 6.60c. Some business has been done since the advance, at 6.25c., St. Louis, and more could have been done had there been sellers. The shortage in production, due also to strikes, and the scant supplies, have resulted in a very strong market, which we quote at 6.25c., St. Louis, and 6.50c., New York.

ZINC

The market has continued to advance, due largely to a fairly good export demand and a higher British market, which has also been advancing. Inquiry from galvanizers is also said to be better. Prime Western for early delivery, 30 days, is quoted today at 7.75c., St. Louis, or 8.10c., New York. The export selling has been largely by Western producers, shipments to be made from Gulf ports.

ANTIMONY

The market is slightly stronger with wholesale lots for early delivery at 8.62 $\frac{1}{2}$ c., New York, duty paid.

ALUMINUM

Virgin metal, No. 1, 98 to 99% pure, is still available at 32c. to 33c., New York, for wholesale lots for early delivery.

ORES

Tungsten: A little domestic business is reported at around \$7 for Chinese ore. For other grades quotations range as high as \$10 to \$12 per unit. A fair demand for export is recorded, some for British buyers and some for Central Europe. The unfavorable exchange rate is a factor against much business, but negotiations are proceeding. There does not seem to be any market for ferro-tungsten and actual prices are difficult to report.

Molybdenum: Quotations are nominal at 75c. per lb. of MoS₂ in regular concentrates, in the absence of any demand.

Manganese: Imports of high-grade ore in August were only 8246 gross tons, against a monthly average of 37,664 tons for the first half of 1919.

Manganese-Iron Alloys: Quotations are unchanged at \$100 to \$110 for ferro-manganese, depending on whether it is British or American alloy. About 10,000 tons of spiegeleisen has been sold to buyers from Holland and Belgium at \$34 to \$35, furnace. About 1000 tons has been sold for domestic consumption, with about 500 tons before the market.

Book Reviews

Industrial Electro-Metallurgy. By Eric K. Rideal. Pp. 236, ill., index. D. Van Nostrand Co., New York. For sale by 'Mining and Scientific Press,' San Francisco. Price, \$3.

This book is one of a series planned to give a complete review of industrial chemistry. The principal commercial processes discussed are electro-plating and other electro-deposition of metals, and the manufacture in the electric furnace of iron, steel, the ferro-alloys, and various other metals, as well as carborundum and similar substances, and the nitrates, cyanides, and cyanimides. The book is suited to anyone with a knowledge of elementary chemistry, and will be of value to those who are interested in the electro-chemical industries.

Governors and the Governing of Prime Movers. By W. Trinks. Pp. 229, ill., index. D. Van Nostrand Co., New York. For sale by 'Mining and Scientific Press,' San Francisco. Price, \$3.50.

This is probably the first complete treatise on the subject in English. The chapters have the following titles: The direct-control governor as a motor; The centrifugal governor as a measuring instrument; Promptness and traversing time; Adjustment of equilibrium-speed; Shaft-governors; Natural period of vibration for governors; Effects of outside forces; Inter-action between governor and prime-mover; Discarded types of speed-governors; Rate-of-flow governors; Pressure governors; and Governor troubles. The book will be of value to those engaged in the design of prime-movers and also to those having oversight of their operation. An appendix contains a complete bibliography.

Steam Turbines. By J. A. Moyer. Pp. 488, ill., index. John Wiley & Sons, Inc., New York. For sale by 'Mining and Scientific Press,' San Francisco. Price, \$4.

This useful treatise, originally issued in 1908, has been revised and enlarged for the fourth edition, taking full account of the recent advances in steam-turbine design. The general theory of steam-turbines is developed in several chapters on thermo-dynamics, nozzle and blade design, and the mechanical losses in turbines. The various commercial types of turbines in use at the present time are then discussed. Then follow several chapters on special types, including low-pressure and mixed-pressure turbines, extraction turbines, and marine turbines. Then come chapters, respectively, on steam-turbine economics, and on stresses in various parts of the turbine. Another chapter is devoted to gas-turbines. The book will be of value both to the designing engineer and the student.

Practical Mathematics for Home Study. Pp. 488, ill., index. McGraw-Hill Book Co., Inc., New York. For sale by 'Mining and Scientific Press,' San Francisco. Price, \$4.

The author of this book is associate professor of mathematics at the Armour Institute of Technology and has taught evening classes at that institution for a number of years. The book includes in one volume the material he has already published in four separate volumes together with some additional matter. It discusses thoroughly arithmetic, algebra through and including quadratic equations, plane and solid geometry, plane trigonometry, and the elements of graphical representation. Every effort is made to associate in the student's mind the practical application with the theoretical basis. For instance, worm-gearing and the use of the micrometer are discussed under common fractions, hydraulic presses under ratio and proportion, and the cutting of rafters under the geometry of triangles. While the main purpose of

the book is to satisfy the needs of the artisan, the mechanic, or the self-taught engineer that feels the need of supplementing his early education in mathematics, it may also be found useful by many technically trained men that wish to review their mathematics, and who have lost or otherwise disposed of their college text-books, and who may be pleased to find under one cover all or nearly all they need.

Techno-Chemical Receipt Book. By William T. Brannt and William H. Wahl. Henry Carey Baird & Co., Inc., New York. For sale by 'Mining and Scientific Press,' San Francisco. Price, \$2.50.

This is a remarkable book containing several thousand receipts of all kinds. These are arranged alphabetically beginning with alloys, artificial gems, and bitters, and going right through the alphabet to waterproofing compounds, wood-polishing, and yeasts. To many that are now suffering from drought, the division on bitters, cordials, and elixirs should alone be worth the price of the book. Joking aside, however, the scope is so wide and the ground is covered so completely, that there are few people in any occupation that would not find a great deal in the book of both interest and value. As is especially necessary in a book of this kind, both the table of contents and the index are remarkably full, making its use for reference easy.

The Construction of Graphical Charts. By John B. Peddle. Pp. 155, ill., index. McGraw-Hill Book Co., Inc., New York. For sale by 'Mining and Scientific Press.' Price, \$2.

The author is professor of machine design at Rose Polytechnic Institute, and the book, although on a sound theoretical basis, is written from the standpoint of the engineer rather than the mathematician. The first five chapters discuss the various kinds of charts in two dimensions, comprising those plotted for rectangular co-ordinates, including logarithmic charts, alignment charts for three or more variables, hexagonal charts, and proportional charts. The next chapter is devoted to the derivation of empirical equations from points already plotted on any kind of a chart. Following this is a discussion of stereographic charts and solid models, and the final chapter considers determinants and their use in the derivations of equations and formulas. The treatment of the various subjects is as simple as possible, and can be readily followed by anyone having a knowledge of elementary algebra. It will be useful both to the engineer and as a textbook for the student.

Heat and Heat-Engines. By Andrew Jamieson. Revised by Ewart S. Andrews. Volume I. Pp. 543, ill., index. Charles Griffin & Co., Ltd., London. For sale by 'Mining and Scientific Press,' San Francisco. Price, \$3.

The eighteenth edition of the late Professor Jamieson's book on steam and steam-engines has been enlarged to two volumes and deals with internal-combustion as well as steam engines. Volume I is devoted entirely to the reciprocating engine, while Volume II will discuss steam-boilers, steam-turbines, and internal-combustion engines. The book has been thoroughly revised and brought up-to-date, at least from a British standpoint, although the American railroadman may be inclined to smile a little at the description of an especially heavy locomotive, weighing 108 tons with the tender, and with 1772 sq. ft. of heating surface. The 26 chapters of the book consider the development of the steam-engine from its earliest form, give the laws of heat as applied to its construction, and then discuss the various types of reciprocating engines now in use, together with pumps and other auxiliary machinery. The book is well illustrated. It will be of value as a text-book, although most American instructors will probably prefer some one of the other

standard books more directly related to American practice, which, while agreeing in the main points with British practice, nevertheless differ in details.

With power interruptions eliminated by the use of electric power, production reaches new records.

Electric Hoists Are Economical and Dependable

EIGHT times as much coal is often burned to supply steam to a small steam hoist as would be necessary to supply steam, in an efficient central station, for the generation of electric power to operate the same hoist.

Piling up of cars at the foot of the hoist is almost unknown where elec-

tric hoists are used. The steady pull of the electric hoist greatly reduces the possibility of delays due to general upkeep, repairing ropes, shaft guides, etc.

Hoist operators are universally proud of their electric hoists and anxious to have them make a fine tonnage record.

General  **Electric**
General Office **Company** Schenectady, N.Y.

UNDER 'Discussion' we publish a reasonable protest against the low salaries paid to mining engineers. This comes to us from Mr. W. F. Dietrich, Associate Professor of Mining in Stanford University. His letter will be read, we feel sure, with interest and sympathy.

ON the very day the coal strike began, it was announced that a general meeting of miners and transport workers in the Rhine valley decided, owing to the lack of coal in Southern Germany, to re-establish the 12-hour day, with voluntary work on Sundays until the crisis is past. Give the devil his due; these Germans show a spirit in some things that is worthy of respect, and of imitation.

BRITISH COLUMBIA is a mining region in which American capital has been used to advantage; therefore our readers will be glad to read the account of the discovery of the Premier mine, in the Salmon River district. This account is attractive because it is the straightforward story of a man on the ground. Moreover, it is peculiarly timely because we are informed by our correspondent at Victoria that a sale of the control of the Premier mine has been negotiated with the American Smelting & Refining Company, the price for 51% being five million dollars.

ALTHOUGH the strike in the Tonopah district is supposed to be ended, it is a fact that the mines are short-handed because the alien element has aligned itself with the I. W. W., whereas the American and British miners are now working as members of the 'domestic' union started locally, in opposition to the radical and un-American group that is trying to subvert honest industry. The I. W. W. leaders have not hesitated to hold out the promise, to their alien following, of a six-hour day and then a four-hour day, with the deliberate intent finally not to work at all, but to enjoy the fruits of other men's labor under a red dispensation, resembling that of the Russian soviets.

SALTING is a subject that is of perennial interest; it appeals to the commercial instinct and also to the mining engineer's sense of humor, although it is fair to add that the victim of it is likely to smile on the wrong side of his face. Mr. Morton Webber discusses this important phase of mine examination from the background of a wide experience, not as a victim but as a successful baffler of "ways that are dark and tricks that are vain".

He recognizes, however, that 'eternal vigilance is the price of safety', and he has shown the proper professional spirit in publishing his own method of prevention, so that others may benefit therefrom. This article will form one of a further series on the sampling of mines that we hope to publish from his pen.

LITIGATION extending over four years was ended on October 27 when the U. S. Circuit Court of Appeals in San Francisco dissolved the injunction and dismissed the receiver granted by the lower court in the matter of the Presidio Mining Company. Captain W. S. Overton, as a shareholder in the company, had brought charges of fraud against Mr. William S. Noyes, the president of the company, which owns a well-known silver mine in Texas. In rendering its decision the Court said: "In all these transactions we find no evidence of fraud or unfair conduct on the part of William S. Noyes in his dealings with the Presidio Mining Company or any of its stockholders and no assertion of a sinister influence over the board of directors or any of its stockholders." We take pleasure in giving prominence to this decision because many of our readers know and respect Mr. Noyes, and they have been aware of the unpleasant litigation arising from a dispute over the management of a mine the success of which has been due largely to his technical skill and business sagacity.

AT the final meeting of the leaders of the United Mine Workers of America, on which occasion it was decided that the coal strike should take place as planned, in defiance of the message of President Wilson, the leaders, according to press dispatches, "disapproved" of the tone the President used. Not one of them, we are informed, defended the President's message, but, on the contrary, they were unanimous that it was a mistake, being "more liable to irritate the miners than to mollify them". The absence of the sense of humor verges on criminality. The President's indictment of the impending strike did not impress us as being an attempt to "mollify" the recalcitrant miners. A mental equipment so devoid of humor as that manifested by these patronizing misleaders of labor may explain the lack of balance that impels them to attempt such an outrageous imposition on the American people. But it can't be done. However much they may be deficient in the sense of the eternal fitness of things, enough of that saving grace is left with the American people to prevent a comparative handful of

disgruntled foreigners, fed on the destructive doctrines of the I. W. W. and organized to obtain their selfish ends at any cost to the public, from subverting the Government of these United States and plunging the nation east of the Rocky Mountains into a glacial condition of industrial paralysis and famine.

IN a recent issue we referred to the flotation, in London, of a new financial and mining company called the Mexican Corporation, organized by the group controlling the Camp Bird and Santa Gertrudis companies. It is announced that this new venture has acquired a large interest in the Teziutlan Copper Company and in the Fresnillo Mining Company. Stock to provide capital for this business has been offered, and taken, by the shareholders in the Camp Bird and Santa Gertrudis companies. The Teziutlan Copper Mining & Smelting Co. owns mines near Teziutlan, in the State of Puebla and about 130 miles east of the city of Mexico. These have produced steadily since 1900, yielding a quartzose chalcopiritic ore free from zinc, arsenic, or antimony. The smelter started to work in 1910 and has exemplified the most up-to-date practice. In 1913 the Mexican revolution compelled the plant to be closed down. The late Robert S. Towne was identified with this enterprise. The Fresnillo Mining Co. is a New York company operating silver-gold mines in the State of Zacatecas. These changes of ownership are to be welcomed as indicating the revival of interest in Mexican mining and the willingness of capitalists to commit themselves to operations in that great mineral region, despite the lawlessness and disorder that unfortunately have retarded industry during recent years. Evidently a continued improvement of affairs in Mexico is anticipated in London.

GOLD MINING in Western Australia has received a flip by reason of discoveries made at Hampton Plains, the scene of some of the earliest prospecting in that State. The district is near Coolgardie and was controlled mainly by the Hampton Plains Estate company, which was organized in 1894, but was so unsuccessful as to be reconstructed in 1906 and again in 1909. At that time the name was changed to Hampton Uruguay Limited, by reason of a large subscription to the Uruguay Consolidated Gold Mines, which owned property in the Riveria province of Northern Uruguay, in South America. The latter company went into liquidation and was wound up in 1914. Meanwhile the mines at Hampton Plains had been worked precariously until 1912, and in September 1914 the parent company likewise went into the hands of a receiver. It was regarded as a dead venture when, in June of the current year, a party of prospectors found rich gold-bearing quartz on Block 50 of the freehold property of the Hampton Properties, a Scottish enterprise in which the Hampton Uruguay company holds a large interest. A prospecting shaft disclosed a lode 25 feet wide, similar in character to the ore-channels that have proved so productive at Kalgoorlie, which is 22 miles distant. Immediately attention was drawn to this

abandoned goldfield and renewed exploration resulted in other finds of a most promising character. Miners congregated thither and leases were given to them by the proprietary companies, whose careers had seemed to be closed definitely. During September the Hampton Properties company issued 268 licenses, while the Hampton Uruguay company issued 201. A correspondent of the London 'Financial Times' reports that a shaft has been sunk on Hansen's lease to a depth of 100 feet, disclosing "an oxidized formation similar to that in the Kalgoorlie mines". The ore averages 27½ dwt. per ton all the way down for the full width of the shaft. On the Syndicate lease 30-dwt. ore has been exposed on the 100-ft. level in sulphide ore. Stock in the nearly defunct companies rose in a few weeks from a few pence to 51 shillings per share, an eager gamble having been incited by the surprising nature of the disclosures. A rush of diggers from all parts of Australia to Hampton Plains is reported from London and a number of syndicates have been organized there and in Australia to take part in the scramble. Fourteen miles of claims have been staked on the strength of these discoveries. One good effect has been to revive prospecting in other moribund gold-mining districts in Western Australia, notably in the Broad Arrow district.

Class Journalism—III

Literature is a criticism of life; class journalism is a criticism of the life of a particular class, meaning thereby not a stratum in society but a group of people engaged in the same occupation and having interests in common. At the present time there is a tendency on the part of engineers toward a larger participation in civic affairs; it is being emphasized that the engineer is a citizen as well as a technician and that his personal welfare, that of his profession, and that of his country call upon him to arouse his political sense, particularly his appreciation of the business of government and legislation. This tendency has been accelerated by the War, in which the engineer awakened to his opportunities for patriotic effort and quickened to a wider interest in big affairs outside his profession. During the War every thoughtful man learned to think on subjects usually beyond his mental horizon, largely because he felt the impact of events and the incidence of actions outside his normal life. The War was a brutal teacher, but it did open the eyes of the professional man, and of those engaged in the trades with which the professions are allied, to matters of worldwide importance, such as political geography, international commerce, and human relationships generally. In consequence, even the technical press felt itself called upon to discuss non-technical matters, recognizing that the tremendous problems of a great crisis in civilization were of more immediate consequence than the subjects to which it was ostensibly devoted. This broadening of the scope of technical journalism was, unconsciously perhaps, in accord with its underlying commercial purpose; during the last five critical years the journalism of the trade and the profession realized

its essential purpose and its true destiny, which is to minister to the thoughts of a class; and in that realization it awoke to a larger aim and a finer achievement. The engineering societies, which latterly have begun to utilize their publications for increasing their revenue by selling advertising space, thereby commercializing their scientific activities, have also bestirred themselves to the consideration of the humanities, especially the welfare of workmen and the relations of employer to employee, in which the engineer is deeply interested as a *tertium quid*. On every side there are signs of a widening of human thought and an education of the public to the complex questions underlying the progress of the art of living, which we call civilization. This is essentially the province of journalism, more so than that of the engineering societies, which, owing to the shifting personnel of their directorates and the indeterminate policies of committee management, are less fitted for the purpose, which is to guide and educate the opinions of the public, more particularly that part of the public engaged in technical pursuits and activities. A new era has opened for class journalism, if it will but avail itself fully of its opportunity. The readers to whom it makes an appeal are more than specialists in technique and industry, they are men and citizens responsive to the tides of human thought and sympathetic to the ideas that sway the political movements of the day. It is a mistake to suppose that the technical man nourishes his mind on technology alone; the technician feels the impulse of desires and interests far outside the work upon which his immediate subsistence depends. He likes, we believe, to read comment on the topics of the day in his own paper, because the editor or other writer in that paper belongs to his own class and views affairs at an angle similar to his own. He may read better editorials and articles on non-technical subjects in the metropolitan press, and rarely in the newspapers of his own provincial community; but the fact that what he reads in his own paper is written by a man of his own kind causes it to appeal to him with peculiar interest and sympathy. Moreover, it must be remembered by those living in the larger cities that many of the subscribers to class journals, especially the engineering periodicals, live in small communities, on the frontier, in the mountains, or in the desert, far from the nerve-centres of the world. These either have no local newspaper to talk to them, or such as they have is wholly inadequate as a source of general information on public affairs. To them their own class journal means much more than it does to the man in the big city; they look to it for comment and criticism on the larger concerns of life; through it they feel the pulse of the world and make themselves part of the wider existence beyond their physical horizon. With the development of democracy, or, rather, the growth of a democratic feeling between men, there will be less of the artificial stratification due to birth and wealth, and more of the solidarity that is founded upon similarities of work and aim. There may be also less of national and more of international feeling, but we are of those who believe that

true internationalism must be based upon sincere nationalism, and that much of the internationalism of today is anti-social in its effects, if not its purpose, and that it still remains true that the best cosmopolite is the man who loves his own country best. This love of country, if accompanied by respect for other countries, and if joined to such solidarity of a trade or profession as breeds sympathy with those engaged in like trades and professions in other countries, will go far to improving human relationships and promoting the progress of civilization. The community of interests and feelings that is connoted by class journalism is not of a narrow kind; it does not shrivel the broader human sympathies; on the contrary, it disregards the narrow barriers of caste. The mining engineer is anything but parochial; he takes the whole earth for his field, and finds clients among all peoples and kinds of people. He is a man of catholic tastes and manifold aptitudes. Nothing human is alien to his understanding. If class journalism is to hold its own, if it is to fulfil its purpose of interesting him, it must grow with its clientele to a larger conception of its duty and a wider realization of its functions.

The Coal Strike

The die has been cast and the issue is plain: shall a small group of men, under cover of a strike for higher wages and shorter hours, overawe the whole country; shall the public welfare be sacrificed to the selfishness of one part of organized labor? Is the Government of the United States to govern or is it to submit tamely to the arrogant demands of any minority sufficiently organized to threaten the industrial life of the country? So far the strike has proceeded quietly and it is already evident that the belated action of the Administration has had a good effect, even if it fell short of the desired end, which was to prevent the strike. This it failed to do because the President's ultimatum and the legal steps taken by the Attorney-General came too late. They should have been taken a week earlier, not on the very eve of the day fixed for the walk-out of the coal miners. Two or three features of this controversy between organized labor and organized society call for consideration. In the first place, the President's reason for vetoing the prohibition measure, namely that the emergency created by the War was past, preceded his use of the Lever Act, a war measure, by only a few days. His action was claimed by the strike-leaders as a glaring inconsistency and unfair to them. The fact, of course, is that the veto on war-time prohibition was based upon the demobilization of the Expeditionary Force and not upon the end of the war in a legal sense. On the other hand, the use of the Lever Act is legally correct because peace has not been concluded. Moreover, the Government is entitled to use the Lever Act, or any other law, that enables it to prevent a great wrong being done to the country by the cessation of coal mining, and if no law existed on the statute-book for the purpose of defending the interests of the public, it would have been given the necessary authority, forthwith, by

Congress itself. Of that there can be no doubt. The Government in its drastic action, by proclamation and by injunction, does represent the will of the country; it is not acting in the interest of the owners of the coal mines or for any private interest; it is fulfilling its function as a government of the people for the people. The strike-leaders exclaim that the issuance of the injunction is "the most sweeping abrogation of the rights of the citizens guaranteed under the constitution", but it was to defend the rights of all citizens, in contradistinction to those of a group, that the injunction was requested by the Attorney-General; it was not issued in behalf of the mine-owners or for any group antagonistic to organized labor; it was the means thought to be the best available for preventing the perpetration of a crime on society at large. The granting of an injunction by the Federal court "does not involve the right", said the Attorney-General, "of labor to organize or strike, but it is based upon the Government's broad power to protect its people". The fact must be remembered that the wage agreement that the strikers sought to terminate at midnight of October 31 applied only to the central competitive coalfield, which includes Pennsylvania, Ohio, Illinois, and Indiana; it did not involve the other bituminous coalfields; therefore the attempt to enforce the demands of the miners in the central coalfield by declaring a sympathetic strike in *all* the coalfields, for the purpose of terrorizing the entire community, was an act of social sabotage; it was anti-social, undemocratic, and deserved to be fought by all the resources of the Government, moral, legal, and physical. Moreover, the Government has a direct interest in the strike, because it has 1237 contracts providing for the delivery of 387,000 tons of coal daily to the Railroad Administration. Since the maintenance of railroad traffic is vital to the industries of the country, the officers of the Government were justified, on this account as well, in taking every legal step within their power to prevent the general paralysis of industry and also the transport of troops. The outcry against the use of injunctions in such a crisis is insincere; the Attorney-General is known to be averse from the granting of injunctions to an employer whereby the processes of the courts can be used on an *ex-parte* hearing to force the employee into submission. "This is the Government itself using its own courts to protect itself from paralysis." It is the Government of the people acting for the people to prevent one small part of the population from holding the country by the throat in a criminal effort to enforce submission to its demands. At the time of this writing, on the first day of the week, it appears probable that an early and peaceful settlement of the strike will ensue. The use of the Army to maintain order, the embargo by injunction upon any overt action on the part of the strike-leaders, and the evident intention of the community at large to support the Government will suffice to dampen the ardor of the strikers and check the virulence of the radical element. The Government is endeavoring to bring the leaders of the two contending factions into conference, and Mr. Gompers appears to be assisting

sincerely in furthering this purpose. The threatening attitude of the Railroad Brotherhoods seemed ominous at first, but they also appear to have responded to the pressure of public opinion. It is not unfair to the Government to say that the conditions under which the Adamson Act was passed, and the submission at that time to the arrogance of the four railroad bosses, prepared the way for the present lamentable condition of affairs. The threat made successfully by the Railroad Brotherhoods to stop all railroad traffic unless their demands were honored by Congress had a most pernicious effect, in that it indicated the practicability of 'holding up' the Government of the country by such means when the next occasion arose, as it has now. If the President and his cabinet had not shown a firm hand at this time, it seems certain that the organized labor of any basic industry could have enforced acceptance of its demands by the mere threat of a general strike. Here we come to the fundamental question: are general strikes consistent with the American idea of civilization? We emphasize 'American', because so many of these violent expressions of labor-unionism are distinctly alien in character; they are supported mainly by foreign workmen, intoxicated with revolutionist propaganda, of Irish, German, or Russian origin. The right to strike, against which sundry reactionary politicians are trying to legislate, is one that cannot be denied at this late day. A man has the 'right' to work or to cease work, but only so long as his cessation from work does not do great harm to his fellow citizens. We would not tolerate, for example, a strike of physicians, because it would be so obviously a menace to all of us; a man's 'rights' are circumscribed by his obligations and responsibilities as a member of society. The ordinary strike, used as a last resort in collective bargaining, is permissible because it is often the only means of protection against unfair or inconsiderate treatment by employers, but a general strike, more particularly a nationwide strike, is an entirely different thing because it involves not merely self-defence on the part of a labor-union, or a group of unions, but a method of gaining particular ends by a general attack on the well-being of the people as a whole and a concerted attack on organized society. Again we assert, what every thoughtful man knows and recognizes in his daily life, that all the 'rights' we have under the law are conditioned upon our responsibility and obligations as citizens in an orderly polity. It is the recognition of these obligations that is the first principle of a democratic way of living. A man has not the 'right' to burn his own house, lest he cause annoyance or danger to his neighbors; a man has not the 'right' to beat his own wife or misuse his own children; he has not even the 'right' to end his own life. The Government of the United States today is asserting the fundamental concept of our American idea of civilization; every good citizen will support the Government wholeheartedly, and with supreme confidence that government for the people will not be swept aside by any truculent aggregation of labor-unions or of any other anti-social group in the community.

The Salaries of Engineers

The Editor:

Sir—I would like to add a few remarks to the discussion by R. H. Toll in your issue of October 18, on the salaries of engineers.

During a three months tour just completed in the mining camps of Nevada, Arizona, and New Mexico, I was impressed more than ever by the fact that "the wages of engineers is starvation". There is a strong feeling among the younger engineers of my acquaintance that they are not receiving fair treatment from the mine operators. These men realize that no matter how capable they prove themselves to be, they will reach a dead line in the course of a few years at a salary of from \$175 to \$250, an amount above which it is impossible to rise without the death or resignation of some higher up or without leaving the organization and taking chances with another company, usually smaller and less stable.

On the other hand, the mine operators complain that while the quality of the men being turned out by the leading mining-schools is very good, as soon as these men become useful to the company they are looking for better jobs elsewhere. The answer to this complaint is easy: pay the men on the technical staff according to their relative value to the company and make sure that the salaries paid are adequate to permit the men to live in reasonable comfort. No man is going to remain with one organization if he can get just as good a job offering an equal or better chance of advancement with another company. It is necessary to the engineer's progress that he study the methods used in many different places, and since his salary is insufficient to permit extensive travel, he is quick to seize an opportunity for working elsewhere.

The mine operators also protest against salary increases by saying that the work done is not worth any more money. This fallacy was beautifully disproved during the War when mining companies offered a base rate of \$125 per month for mining engineers as surveyor's helpers, as compared to \$85 or \$100 per month previous to the War. Now that the War is over and base-metal prices have decreased (but not the cost of living) these same companies are paying a base rate of \$90 to \$100 per month for this work, excusing themselves on the plea that the men are not worth any more to the company, and that at any rate the supply is plentiful.

In many of the large mining companies in the United States, the salary of the chief engineer, chief geologist, or chief assayer is \$250 per month plus a bonus based on fluctuations in the metal price. The highest salary for the men under them is \$165 to \$180 per month, and that

can only be attained after many years of service. The practice in many of the mining companies employing white labor underground is to start the engineers as 'muckers' (a good thing in itself for those who have had no previous experience), then after a few months to 'promote' them to the engineering office at a salary less than they were receiving as 'muckers'.

It is evident that the whole problem is a question of supply and demand with the operators holding the purse-strings and taking an unfair advantage of the normal excess of supply over demand. While it is quite true that a large mining company needs many routine men and that these men need not possess high qualifications, it hardly seems fair that they should be penalized for the loyal and submissive service they render to the company simply because they are unorganized.

Comparing these conditions with those prevailing in the petroleum industry, we find that so-called oil geologists are started fresh from college at salaries ranging from \$175 to \$250 per month, and there is a disposition among leaders in the petroleum industry to regard this as a permanent condition. The salaries paid for the higher executive positions and for consulting work are no higher than in metal mining. The young oil geologist is entitled to the salary he is paid, as he is evidently worth it to the company. Why cannot those wishing to start in metal mining have an equal chance?

Stanford University, October 22.

The Index-Number Wage

The Editor:

Sir—In the issue of 'Commerce and Finance' for May 7, 1919, the editor, Theodore H. Price, presents an interesting account of the 'Index-Number Wage', or a scientific method for adjusting wages to the cost of living. The following is a digest of his article.

In what is known as the 'index-number', we have the first scientific effort that has been made to determine just what the decreased purchasing power of money is. Any effort toward this end is worthy of careful study by those who look forward to the time when wages and prices shall be intelligently regulated in conformity with economic law and the costs and wastes of strikes and deceptive bargaining shall be avoided.

The index-number represents the average of the prices of the commodities that are essential to civilized existence. The prices must be averaged at successive dates (usually at regular intervals), and a comparison of the

index-numbers for different dates will show the average decline or advance in the price of commodities during the period under consideration. Since the wants of civilized man include a great many different things that are consumed in different proportions, it is necessary that the index-numbers, to reflect accurately changes in the cost of living, be not only the average of the prices of a large number of articles, but a weighted average as well. The price of each article is therefore multiplied by a factor which about equals the ratio that the consumption of the article (or group of articles) bears to the total normal consumption.

The index-number compiled by the R. G. Dun Co., known as Dun's number, includes the prices of some 300 products, so arranged that foods count for about 50% of the total, textiles for 18%, minerals for 16%, and other commodities for about 16%. The division, of course, is arbitrary, but it is an approximation of fact, and the number of commodities included is larger than the number used in the composition of any other index now known. Index-numbers are published by other authorities, among which are Bradstreet's, Babson's, the U. S. Bureau of Labor Statistics, the 'Statist', and the 'Economist' in England, and the Department of Labor in Canada. Index-numbers are also compiled, either officially or unofficially, in Australia, Austria-Hungary, Belgium, Denmark, France, Germany, India, Japan, Netherlands, New Zealand, Norway, Russia, and Spain.

The index-number wage has been adopted by several American corporations. The details followed in each case differ somewhat, but, in general, the plans are similar. The base taken is the wage paid upon a certain date, when it is assumed that earnings and the cost of living were in equable relation to each other. On subsequent pay-days the employees receive two envelopes, one containing the base wage, and the other, often called the H. C. L. envelope, containing a percentage of the base wage equal to the percentage of advance in commodity prices over those current at the time the base wage was established, as shown by the most recently published index-number. Some of the concerns using this method of paying wages are: the Oneida Community of Oneida, New York; the Kelly-Howe & Thomson Co. (hardware), of Duluth; the George Worthington Co. (hardware), of Cleveland, Ohio; the Prints Biederman Co. (clothing) of Cleveland; the Index Visible (Inc.) of New Haven; the Mishawaka Woolen Mfg. Co., of Mishawaka, Indiana; and the Union Bleaching & Finishing Co., of Greenville, South Carolina. The South African Gold Trust Co., Ltd., of London, follows this method in paying its clerical force.

It is believed that the use of the index-number wage will provide a permanent solution for many problems that must confront both employer and employee as the purchasing power of money changes. Such a wage, rising and falling as the cost of living fluctuates, would, to a great extent, obviate strikes, lessen discontent, and reconcile the wage-earner to lower wages when prices decline, because he would realize that when they went up

again his pay would increase without any demand on his part. The employee would be led to study economics and to practice an intelligence in buying that would make extortion or profiteering on the part of the retail merchant with whom he dealt extremely difficult. One concern encloses in the H. C. L. envelope a slip giving the wholesale prices of most things the employees need. By comparing them with the retail prices demanded, it is at once evident whether the storekeeper is asking more than a reasonable profit.

An interesting variant of the index-number wage is given in a letter from W. A. Stinchcomb, county engineer in Cuyahoga county, Ohio. In his office there are nearly one hundred engineers, draftsmen, field-men, clerks, etc., who are employed on road work. These were asked to fill out a questionnaire on which information was asked relative to the number of dependents, whether the employee rented or lived in his own house, and a distribution of his salary into the following items:

- | | |
|------------------------|----------------------------|
| 1. Food. | 4. Rent. |
| 2. Clothing and shoes. | 5. Miscellaneous expenses. |
| 3. Fuel and light. | 6. Savings. |

Since the salaries paid to employees ranged from \$1000 to \$3600 per year, it was apparent that it would not be fair to pay the bonus on the same index to all men, for the percentage of his salary paid by the employee with a small salary for food would be larger than the percentage paid by the man with a greater salary for the same item. The returns from the questionnaire were classified into three groups.

| | Class A. Salary less than \$1600 | Class B. Salary \$1600 to \$2400 | Class C. Salary over \$2400 |
|--------------------------|--|--|-----------------------------------|
| | % | % | % |
| Food | 38 | 37 | 27 |
| Clothing and shoes | 15 | 14 | 13 |
| Fuel and light | 5 | 6 | 3.3 |
| Rent | 21 | 21 | 16.5 |
| Savings | 8 | 10 | 20 |
| Miscellaneous | 13 | 12 | 20.2 |

The commodity values reported by Bradstreet's for food, clothing, and partly for miscellaneous were adopted as a basis for computing the index for those commodities. A sub-division was made in the matter of fuel and light, separating gas and electricity from coal, as the prices for gas and electricity remained fairly constant. The investigations made by the Cleveland Real Estate Board were taken as a basis for rent. The index values for February 1919 were as follows (the index values for January 1917 were taken as the base in all cases):

| | | | |
|---------------------------|-------|---------------------|-------|
| Food | 1.426 | Rent | 1.150 |
| Clothing and shoes | 1.132 | Miscellaneous | 1.146 |
| Gas and electricity | 1.000 | Savings | 1.000 |
| Coal | 0.844 | | |

These commodity indexes taken as a factor, times the percentage used by the men of the various classes, provided for February the following bonuses, which were paid in addition to the fixed salary base as determined in January 1917.

| | |
|---------------|-------|
| | % |
| Class A | 23.00 |
| Class B | 22.27 |
| Class C | 18.57 |

The peak of commodity prices, and therefore in salary

bonuses, was reached in December 1918, when the following indexes were established:

| | | | |
|---------------------------|-------|---------------------|-------|
| Food | 1.520 | Rent | 1.150 |
| Clothing and shoes | 1.236 | Miscellaneous | 1.184 |
| Gas and electricity | 1.000 | Savings | 1.000 |
| Coal | 0.876 | | |

On this basis the bonuses paid were:

| | % |
|---------------|-------|
| Class A | 28.64 |
| Class B | 27.61 |
| Class C | 23.18 |

Apparently the system has given satisfaction; it has merely established an act of justice between employer and employee. It is an attempt to pay for services in the things that the employer and employee need and use, and which do not bear a fixed and constant relationship with the dollar.

ROBERT S. LEWIS.

Salt Lake City, October 16.

Gold, Prices, and War Debts

The Editor:

Sir—Mr. Brinsmade's contribution to 'Discussion', in your issue of August 16, is of great interest. While there is an inequality of wealth, and a stiff inheritance tax seems to be the one method by which dynastic control can be broken, unfortunately corporations and nations do not die; hence the machinery for exercising great power exists, and so although we may tax a family out of control, some other person or persons will succeed to that control. A discussion of this phase of the question would be apart from my present object, and although I hope at some future time to have an opportunity for enlarging upon the idea, I would, in passing, record the thought that a limited term of office, for officials in charge of great corporations, might have a restraining influence both upon the officials and the corporations under their control.

While agreeing with Mr. Brinsmade as to general causes and effects in regard to high costs, I am not prepared to subscribe to some of his statements. It is difficult to bring into agreement his fling at "humane but superficial economists who form the unwitting clique of professional labor-monopolists like Mr. Gompers" and his statement, "No! it was not a low wage scale that made 'pre-war standards' unjust for Mr. Robbins' laborers; it was rather the plundering they underwent by various classes of cunning monopolists, who, under legal forms, carried off to their private coffers the lion's share of the social wealth, etc." For every force there is an equal and opposite reaction, and if we have extremists in finance we must expect extremists in labor, and every social movement must have its leaders. I have great respect for Mr. Gompers, largely because of his successful avoidance of the creation of a labor party in politics.

An acknowledgment of class distinction is absolutely un-American, and the preservation of Congress as the forum of all the people, without regard to the continental divisions of labor, capital, aristocracy, and religion, is to safeguard republican principles. Labor-monopoly is an ideal, and ideals must by their nature be in advance of

what can be accomplished. The recent demand of railroad employees concedes a place to brain-labor, and by so doing robs "labor monopoly" of the dreaded establishment of the power of ignorance. Nor can I concede that conditions have been made unjust entirely by "plundering classes of cunning monopolists". I have seen so many mining magnates, who "toiled not, neither did they spin", created by nothing but accident, that I know the blame for their affluence cannot be ascribed to cunning. It is true that much deceit is practised in business, but since the days of Jacob and Esau it has been necessary to recognize this human trait. Our failure to formulate laws that successfully limit the prizes won by luck and deceit is due to our lack of knowledge. We are learning by experience how to regulate our affairs; but, such is our blindness, as the human family advances in knowledge, that knowledge must first be applied to the taking of an unfair advantage before the unfair advantage can be recognized.

I do not at all agree that "It is only the uninformed who fancy that organized labor speaks with preponderant authority". My experience with organized labor dates back to the time of the Haymarket riots in Chicago, at which time I was working as a shop boy in a brass works. Our shop was ordered out on sympathetic strike, although we were unorganized and our wages and hours were better than those demanded by the unions. In Philadelphia some twenty-four years ago, as a traction company employee, I had a close-up experience with a street-car strike. During nine years in South Africa I watched the gradual growth of labor organizations; for two years in New York, as an employer, I was continually dealing with a variety of labor organizations; and in eleven years in Canada, I was engaged in three struggles against unlawful domination by the Western Federation. I state these facts in direct opposition to Mr. Brinsmade's statement that it is only the "uninformed" who fancy that organized labor speaks with authority. If 10% of the people interested are organized upon any question pertaining to labor, capital, politics, or other activities, that 10% speaks with preponderating authority, for the vast majority of people do not think about the matters which affect them.

Mr. Brinsmade accuses me of not having much sympathy for holders of securities, which rather puts me in the category of those who live in glass houses. Be that as it may, Mr. Brinsmade stultifies his plea "Even when . . . wage scales . . . may have become adjusted . . . , there would yet remain the stigma of general defrauding of creditors to be palliated by those advocating the maintenance of this scale by artificial means, like debasing the coinage", when he refers to the "plundering classes of cunning monopolists" who have carried off the lion's share of social wealth. If the bulk of social wealth has been carried off as plunder by means of cunning (and luck), our conscience should be clear if we openly go after the plunder with a big stick. Honesty is based upon a recognition of the rights of others, and while we must avoid any readjustment that will disorganize our

social scheme, we must be careful that no misconception of what is honest shall deter us from doing what is best.

I confess that I cannot see any dishonesty in any adjustment of human affairs which benefits the whole family. For centuries, struggling humanity has been endeavoring to be honest with itself; to provide a more equitable distribution of benefits; to reduce poverty and suffering; and to limit the power of individuals and classes. We have driven ourselves into a fairly close observance of "Thou shalt not steal", but we have with blindness disregarded "Thou shalt not covet". Every so often, when the load of things put over becomes unbearable, the public (with honesty) shakes some of the load from its shoulders. Time was when war and revolution were readily resorted to in adjusting these matters, but we are trying to get away from such methods and are making our adjustments by sane legislation.

Mr. Brinsmade seemingly considers it dishonest to partly repudiate a payment due, by tendering a smaller quantity of gold than that agreed upon at the time the debt was contracted, and yet 95% of these promises to pay in gold have been made with a full knowledge that there is no possibility of fulfilling the promises in the event of all security holders demanding payment in gold. Payment in gold is understood to imply "payment in credits partly secured by gold", and except in comparatively few cases the security holders never demand gold. In California all real estate transfers are made "payable in gold", although both parties to the sales realize that payment will be made by check. In international adjustments, where gold is required to settle balances of trade, demands for gold may be large, but we know that there is not enough gold in the world to satisfy the payments due to this country by any one of the European powers, and we do not expect nor do we want payment to be made in gold.

Every time we increase the income tax or the inheritance tax, we are breaking the promises made and guarantees given to men when earning their incomes and accumulating their fortunes. We acknowledge that in spite of our best endeavors we have made mistakes; some have got more than their share of wealth, and we adjust the matter by taking away a part of the income or fortune. We cannot see into the future with sufficient clearness to enable us to frame laws that will not require adjusting. When we tax an income or an estate we are taking something away after it has been accumulated. Our action acknowledges that an error has been committed in allowing too big an income to be earned or fortune accumulated. But although our adjustment is a corrective for past mistakes, it is in no way a preventive against similar future mistakes. We adjust the result, but not the cause of the error. Without going into the pros and cons of adjusting the price of gold, I merely wish to point out that an adjustment that prevents an error is not so dishonest as an adjustment that corrects an error, for if it be against the best interests of the human family that men should become possessed of large incomes and fortunes, then a preventive is far better than a corrective. A preventive will act to dis-

courage covetousness, cupidity, and even crime, whereas the corrective will tend to encourage these.

Gold is the armament of finance; it is the battle fleet that dominates the sea of commerce. The struggle among the nations to accumulate gold reserves has been no less fierce than the struggle to accumulate navies, and, strangely, the two embodiments of power seem to be corollaries of one another. The power of Great Britain to levy tribute upon the entire commerce of the world was built upon her ability to pay demands in gold. Her great system of foreign banking agents, which enabled her to buy exchanges at a discount, had a foundation of gold. When the merchant in South Africa purchased beef in Argentine, the transaction was facilitated by discounting the payment in London. Great Britain acted as a guarantor of the good faith and reliability of both parties, and levied a tribute for her good offices. But this constant accretion of wealth that streamed into the coffers of Great Britain did not benefit the mass of her people. Theoretically, the wealth thus acquired was used to promote and finance foreign enterprises, through financial control of these enterprises creating a market for products of British manufacture; practically, much of this wealth was invested in the United States, Canada, and upon the continent of Europe, where no markets for British goods existed. Thus the financial power of Great Britain steadily increased, but a great and unnatural chasm developed between the wealthy and the poor. The wealthy kept growing more wealthy because of foreign trade, while the poor kept growing poorer because of foreign competition, sometimes financed by British wealth.

The position of intermediary in foreign exchanges gave Britain a command and a direction over foreign trade, a command as contrary to the instincts of enlightened humanity as would be the placing of a fleet of privateer warships at the entrance to every harbor and demanding a tribute from the cargoes of all ships which pass in or out. We are talking of forming a League of Nations to police the world. One of the main features of the League is disarmament; there is to be freedom of the seas, whatever that may mean; but the underlying principal is that there shall be no domination of the weak by the strong. In the struggle between European nations, their gold reserves were spilled, and we picked up the big share of the scattered metal. Do we want the dominating power which goes with this reserve? Our merchants, our bankers, are not educated and trained in the piratical use of this golden fleet, and it is to be hoped, for our future peace, that they will not acquire the habit.

If the European struggle had been conducted in such manner that navies were not used, and we had exchanged field munitions for the various warships of the belligerents, and thus found ourselves in possession of the world's naval strength, would we be organizing this strength with a view to dominating the world and levying tribute upon all overseas commerce? That question was answered when we sent our navy to break up the stronghold of the Tripoli pirates. If by chance we had become possessed of the world's equipment of warships,

we would convert them if possible for commercial use, providing the rest of the world would agree to build no more ships of war. Having become possessed of the gold reserve of the world, our honest duty is to convert it into an exchange commodity for free circulation in peaceful pursuits, agreeing with the other nations upon a price which shall preclude hoarding and which shall carry no other power than the token value.

Mr. Brinsmade points out that the fall in the price of British consols constitutes my chief defence of the proposal to increase the price of gold. I chose this example because, so far as I know, it is the only case where the attempt has been made to definitely establish a permanent measure of the value of labor in terms of ounces of gold. It is true that interest rates have increased since 1812, and so have wages. There has been a constant sawing between labor and capital, until in 1919 wages and interest rates have arrived at a condition such that the value of gold is indicated by the price of consols to be approximately thirty dollars per ounce. When the price of gold was fixed, it was fixed at the market price per ounce on the day upon which the legal price came into effect. That market price was the resultant between interest rates and wages of that date. The resultant today between interest and wages is about thirty dollars per ounce for gold. If wages are to be lowered, then interest rates must be lowered, otherwise dangerous conditions of strife will arise. But why reduce wages to the standards of 1915 or 1815? It is not the wages; it is the benefits that men demand. Those of us who have built up organizations in out of the way places know how often mechanics who can obtain work in the cities will relinquish the comparatively high mining-camp wage and return to the lower city wage in order to enjoy the schools, amusements, comfortable dwellings, and other benefits which the city offers.

There is profiteering at present among wage earners, middlemen, and capitalists. When the middleman finds his profits dwindling he will consider the advisability of joining the ranks of the producer, and there will be a gradual adjustment among the three classes in relation to one another. As the adjustment takes place, high wages, as expressed in dollars and cents, will make possible more hair-splitting economies. In the coinage of this country the smallest unit in which the ordinary man can think is one cent. At a wage of three dollars per day, this unit is $\frac{1}{3}$ of 1% of his wage; at six dollars per day it is $\frac{1}{6}$ of 1%. The stick of candy, the box of matches, and other articles which sell for one cent have not changed in price during the advance in wages; they have sold for the lowest available coin. While the expense of living is not due to the one cent purchases, yet when a man can divide his pay into six hundred units, he will be encouraged to practice a greater economy than would be practicable if his pay could only be divided into three hundred parts.

Present-day wages are inflated, as are the earnings of capital, but it does not seem possible that wages will return to pre-war standards, and there is every indication that earnings of capital will be curtailed.

The astute Oriental has always been a keen trader in precious metals. During the period of depression in silver Asia absorbed and stored tremendous quantities of that metal. Now India is exchanging her uncounted millions of silver bullion for gold, and that gold will be stored in the hiding places of the super-wealthy Indian potentates. The taking of gold from circulation is a condition to be avoided unless gold be demonetized. The storing of vast treasures of this basic commodity in a country unable to defend itself is a danger to the peace of the world, for it creates a temptation for any predatory political power that may be in a position to do so to possess itself of that great store of wealth and to use it in the advancement of self-interest. Moreover, the power of gold is already so great that any tendency to increase that power should be guarded against. The removal of gold from circulation within and between commercial countries, and its storage in the secret vaults of those who are not engaged in commerce, will intensify the power of such gold as remains in circulation.

We can still pay the debts which demand gold at \$20.67 per ounce, and immediately commandeer the gold when paid; and although such a course would be a subterfuge, it would nevertheless allow us to live up to the letter of our agreements.

No student of present-day conditions can avoid the conclusion that tremendous social adjustments are in progress, and a self-satisfied reliance upon the inexorable laws of supply and demand to bring things to a satisfactory solution is a dangerous procedure. We have had titled aristocracy and financial aristocracy, and although there is an ever growing sentiment against these classes, they have served a great purpose in leading humanity. We have now built up an aristocracy of education, and it seems to be the task of this class to solve our social problems. If adjustments are to be made calmly according to the laws of supply and demand, then we must listen to those insistent demands that are being made for a more equitable distribution of life's benefits.

San Francisco, August 29.

P. A. ROBBINS.

TIN is one of the few highly useful metals that are practically not produced in the United States proper. The output of tin from domestic ore in 1918 was only 68 tons, nearly all of it obtained from placers in Alaska. The tin imported in 1918, as metal and in concentrates, amounted to 82,854 short tons, the largest quantity yet brought into the country in any one year. Deposits of tin ore are found in California, Virginia, North Carolina, South Carolina, South Dakota, Washington, Nevada, and New Mexico, but the ore at some of them contains so little tin that it cannot be mined with profit. Tin concentrate from Bolivia was handled at four tin-smelting plants in this country, which produced from it over 10,000 tons of metallic tin. A report on tin in 1918, by Adolph Knopf, has just been published by the U. S. Geological Survey as a chapter of Mineral Resources for 1918, and can be obtained free of charge on application to the Director of the Survey at Washington.

The Cananea Ore-Bedding System

By G. W. PRICE

This plant was commenced and partly installed under the management of Arthur S. Dwight in 1905 and 1906 and completed and placed in operation by L. D. Ricketts in 1908. The details of this system were worked out by E. H. Messiter, consulting engineer for the Robbins Conveyor Belt Co. The object is to secure perfect mixture of the blast-furnace charge and at the same time provide a considerable storage for ore. This system, which was the first of its kind, has been in operation for ten years, except such time as revolutionary troubles have closed the smelter.

The ores from the various mines are hauled in trains of eight 30-ton Ingolsby dump-bottom cars over the company's 36-in. railway and weighed two at a time on a 120-ton Fairbanks scale, being dumped into one of nineteen 250-ton receiving-bins, from which they are drawn onto a 30-in. belt-conveyor, which carries the ore to a pair of 4-in. grizzlies over two 24 by 36-in. Farrel crushers. The fine from the grizzlies and the crusher product fall onto a 24-in. belt that delivers the ore to a Vezin sampler, which, at present, takes a tenth cut, the reject going to another 24-in. belt, which delivers it to a traveling tripper-car over the ends of the various beds.

The sample is fed onto a 20-in. belt, which delivers it to a 10 by 20-in. crusher followed by a Vezin sampler, which again cuts a tenth for the sample. The sample falls into a No. 2-D Gates gyratory crusher followed by a Snyder sampler cutting one-fifth. This passes through a set of 14 by 20-in. rolls and leaves the sample of 600 to 1000 lb. in good condition for mixing and quartering on plates in the usual manner. The reject from the sample in each case goes to a bucket-elevator, which delivers it to the 24-in. belt carrying the main stream of ore to the belts over the beds where it is discharged onto one of three 22-in. conveyors equipped with an automatic traveling tripper-car, which distributes the ore on a bed about 50 by 400 ft. These beds usually contain about 10,000 tons of mixed ores and furnace by-products when completed and are reclaimed by one of two Robbins reclaimers, having a capacity of about 200 tons per hour. These machines deliver the charge onto a 20-in. belt-conveyor, from which it is taken by a 22-in. belt up an incline above the furnaces, where it falls onto a 20-in. belt delivering it to the various furnace-bins by means of a traveling tripper-car. These bins contain about 70 tons of ore each and allow for shut-downs of the reclaiming plant for three to four hours, which is ample for necessary repairs, belt changes, etc. The entire system employs about 40 men during the 24 hours and is in charge of one American foreman, all the other employees being Mexicans, who make the necessary repairs. The maximum tonnage reclaimed and

smelted by the blast-furnaces during 24 hours is 3800 tons, while over 4000 tons per day have been bedded.

This system has handled over six million tons of ore as follows:

COST PER TON OF SAMPLING, BEDDING, AND RECLAIMING

| Year | Tons | Operating | Repairs | Total |
|------------|-----------|-----------|---------|--------|
| 1908 | 211,340 | 0.1783 | 0.0370 | 0.2153 |
| 1909 | 564,237 | 0.1267 | 0.0362 | 0.1629 |
| 1910 | 578,235 | 0.0936 | 0.0149 | 0.1085 |

These costs include all renewals, changes, improvements, and repairs during the ten years. The system is in first-class operating condition and should last indefinitely, except for such repairs as are made from day to day. The belt-conveyors last from six to nine months where the service is especially hard, and from five to six years where the service is lighter; several belts having handled 1½ to 2 million tons of charge before needing renewal.

This system has resulted in a great saving in labor and coke, and it seems to be a cheap and dependable method of getting a perfect mixture for the blast-furnace charge, and at the same time providing storage of 10,000 to 20,000 tons capacity.

THE three minerals most needed to make our agricultural industry more productive and more prosperous are potash, nitrate, and phosphate. Most of the potash and nitrate we use is imported, but our domestic supplies of phosphate are abundantly ample to meet all our requirements, and for years we have been heavy exporters to Europe. The total quantity of phosphate rock in the United States in 1918 was nearly 2,500,000 long tons, having a value of more than \$8,000,000, over twice as much as was produced in that year in all the rest of the world. Florida alone produced more than 2,000,000 tons, having a value of about \$6,000,000. A report on the phosphate-rock industry by R. W. Stone, which has just been published by the U. S. Geological Survey, gives the details of production in 1918 by States and by kinds of rocks, shows the world's production by countries and by years from 1910 to 1918, and includes tables showing exports by countries. The report also describes the distribution, character, and method of mining phosphate-rock.

THE BEDDING SYSTEM AT CANANEA

DISTRIBUTING THE ORE BY A TRAVELING TRIPPER-CAR

The Premier Gold Mine, Portland Canal, B. C.

By CHARLES BUNTING

*Much has been written about the Premier mine, situated near the head of the Portland Canal, which, while interesting, is at variance with the facts. The writer is well acquainted with the property, its orebodies, values, and history, and will briefly review the facts relating to the above and indicate the immense possibilities of this remarkable mine. All the known orebodies of the Premier, three distinct veins generally referred to as the low-grade veins, as well as the high-grade vein, are found on two of the company's claims. These are the Cascade Falls No. 4 and the Cascade Falls No. 8, which were two of a group of eight claims numbered 1 to 8 and known as the Cascade Falls group. They are situated on the western slope of the range which divides the Salmon river from the Bear river and were the first locations in that section of the Salmon valley. They were discovered and staked by William Dilworth and the Bunting brothers in June 1910. The two claims numbered 4 and 8, along with an adjoining group staked later by other parties, passed to the control of O. B. Bush, the Salmon-Bear River Mining Co. being organized by him during the winter of 1910-'11 to operate them.

The work done during the two following summers by the Salmon-Bear River Mining Co. consisted of short tunnels and surface cuts; it was confined to the low-grade showings, the results being fairly good. A great outcrop of good-looking quartz, containing some iron pyrite, and a little native silver was 'passed up' after a few shots had been put into it, and no attempt was made to trace it out. This outcrop has since proved to be the biggest and best surface showing of the high-grade vein.

The property was then idle until the summer of 1914, when it was examined for a well-known eastern Canadian company by W. J. Rolfe. The outcrop attracted his attention and work commenced at once. The vein was traced for fully 800 ft. down the hill in a westerly direction, the surface was stripped, and cuts put in at intervals along its whole length. The results were excellent, good ore being exposed in every cut, some of it running as high as \$500 in gold and silver.

After securing such fine returns, for some unknown reason—possibly on account of the outbreak of the War—this company discontinued work. Credit is due W. J. Rolfe for his shrewdness in confining his work to this particular vein, to the exclusion of the low-grade showings, thereby demonstrating the presence of at least one large orebody running exceptionally high in gold and silver, with a lead content of less than one-tenth of 1%. Until

this time speculation regarding the future of the camp had been based on the great showing of low-grade ore.

An entirely new conception of the potentialities of the camp was a direct outcome of his activity. The property was then immediately bonded for New York interests by H. R. Plate, and work commenced the ensuing winter. A tunnel, No. 1, was started at an elevation of 2100 ft. on the high-grade vein in good ore, and another tunnel, No. 2, at an elevation of 1850 ft. on the middle low-grade vein, also in good ore. No. 2 cut the ore-shoot diagonally for over 30 ft., the values being good. The tunnel was extended about 200 ft. beyond the ore-shoot into the country-rock, and a cross-cut of 30 ft. to the left from the face was also in country-rock. Work was then stopped in this tunnel. No. 1 tunnel was also driven diagonally across the ore-shoot, which left the tunnel on the right side at a point about 80 ft. from the portal. The tunnel was continued almost straight ahead—following a slip for a considerable distance—for a further 170 ft., a total of 250 ft., without picking up the ore again. A cross-cut was also driven to the right for about 12 ft., about half of it being in vein-filling, but lean. This tunnel was then abandoned. A cross-cut was then driven northerly from a gulch some 200 ft. south of tunnel. After being driven 60 ft. without getting ore, this too, was abandoned.

A cross-cut tunnel, No. 4, was now started farther down the hill, about 450 ft. below No. 2 and driven about 500 ft. before the vein was encountered. This proved to have a width of well over 100 ft., but was poorly mineralized. A drift of 40 ft. alongside a small diorite dike was run, in which some ore was just showing up when the New York syndicate threw up their bond and quit the camp, after operations extending over nearly 18 months at a cost exceeding \$60,000.

In the summer of 1918, a few months after H. R. Plate had left, R. K. Neill of Spokane was induced by Pat Daly—who had been foreman for both Bush and Plate and still believed it would make a mine—to look over the property. The examination and sampling proving satisfactory, Mr. Neill bonded it the following winter for \$100,000, beginning work in the spring. His first work was done in No. 1 tunnel at the point where the high-grade left it to find out what happened to the ore, with the intention of following it if it continued. A few shifts sufficed to show the vein was really paralleling the tunnel, and at no point in the whole 250 ft. of Plate's work was it more than 6 ft. away, while the face of the tunnel where work was stopped was actually in the vein.

As the vein here is almost barren—values \$1.50—and closely resembles the wall-rock in which he had drifted for the last 160 ft., no doubt Mr. Plate failed to realize

*From the 'Canadian Mining Journal' of October 7. Mr. Bunting is one of the original locators in the Salmon River district, now made famous by the Bush, or Premier, mine.

that he was in the vein. Had he, before deserting this tunnel, driven two feet to the right he would have been in \$5 ore, while five feet ahead would have reached high-grade ore.

This is an outstanding example of a great mine being missed by a very small margin. It is just such hazards and great rewards that gives mining the fascination no other industry possesses.

When the first work showed beyond a doubt the real direction of the orebody, nothing more was done there. A cross-cut was started about 60 ft. farther in, and reached the ore in 6 ft. Plate's 12-ft. cross-cut was extended about 30 ft. After driving each of these cross-cuts into good ore for nearly 40 ft., without reaching the other wall, Neill decided to start a cross-cut from the face where Plate had quit, and also to drive ahead a further 600 ft. to get under the last of the series of open-cuts, which exposes the ore-shoot on the surface and shows it to have a width of from 100 to 150 ft. This cross-cut, No. 3, showed good milling-ore the first round; at 15 ft., high-grade came in and stayed the full length of cut. It was driven 82 ft. without reaching the hanging wall; a cut on the surface directly above shows fully 40 ft. of good ore yet to be cut. For some distance the full width gave values of several hundred dollars per ton in gold and silver, while the average for the entire 82 ft. is better than \$55.

The face of the main tunnel was swung a little to the right and driven ahead. In four feet, ore running over \$125 per ton showed up on the right-hand side; at 10 ft. there was a full face of ore, showing considerable native and ruby silver which gave values of \$153 per ton. This tunnel has since been driven about 350 ft. farther and with the exception of about 30 ft., when passing through some almost barren ground, the full width of tunnel has been in high-grade ore, averaging several hundred dollars per ton.

No. 4 cross-cut, which is in about 40 ft., cut 10 ft. of high-grade, then passed into ore of a lower grade. No. 5 cross-cut, recently started, averages \$50 per ton for the six feet it is in. This tunnel is now in a distance of approximately 600 ft., giving a vertical depth of nearly 300 ft. It has still to be driven about 200 ft. to get under the great surface exposure already described. This will give an additional depth of perhaps 50 ft. only, as the hill flattens considerably above.

In the block of ground 800 ft. long and fully 100 ft. wide as proved by surface-cut and underground work and from the surface to the present level, a tonnage of at least 1,000,000 can be safely estimated with a gold and silver content of \$30 per ton, making a total of \$30,000,000. A thorough sampling of all the present workings and openings gives an average value of well over \$30 per ton.

As the ore-shoot is bigger, stronger, and far richer in the tunnel than on the surface, it is safe to assume it will continue for at least 50 ft. below the present workings. In that event—and any engineer familiar with this orebody would concede that much—a further \$10,000,000

can be added to the above total. Work was resumed in No. 2 tunnel this summer, a cross-cut being driven to the right, to cut the ore-shoot about 150 ft. east of the portal where originally cut by Plate. In about 60 ft. the ore was broken into. It has a width of 10 ft. The average across is a little less than \$20 per ton. This cross-cut was continued and has since tapped the ore-shoot to the south. The face is at present in good ore.

Each of these veins, and also another to the north of

PART OF BRITISH COLUMBIA. 'BUSH', ABOVE STEWART, MARKS THE POSITION OF THE PREMIER MINE

them, has the appearance of a potential mine. During the whole summer of 1918 the mine was shut down, work being concentrated on the construction of a sleigh-road from the beach to the mine, a distance of 16 miles, and a short dock at Hyder for the purpose of shipping ore the next winter. Owing to unforeseen delays in the delivery of equipment and an exceptionally early break-up of the snow-road in the spring, only 512 tons was shipped, which gave smelter returns of \$168,000.

Two stopes have been opened up, putting the mine in good shape for shipping as soon as the snow flies. Since the snow went, operations have been almost entirely confined to outside work. A portable saw-mill is cutting lumber and a number of new buildings are being erected at the old camp for the accommodation of a greatly increased force of miners. The road is being widened and improved, and new barns and other buildings will be put up at the beach and nine mile. The saw-mill has been moved to No. 4 tunnel—H. R. Plate's last work—and a new camp is being built there. A compressor is to be installed and the present 5 by 7 tunnel enlarged to 7 by 7.

A cross-cut will be started a short distance from the face which will reach the high-grade ore-shoot in a few hundred feet, at an additional depth of 700 ft. below the present workings. Providing the ore-shoot holds its size and values at that depth—and the chances are decidedly in its favor—the figures relating to the tonnage and values will be almost startling. In that event, this property, which already ranks as one of the world's great mines, would then take rank as one of the greatest. It will still be possible to obtain a further depth of fully 500 ft. on the vein by driving another tunnel near the foot of the mountain, making a total of not less than 1500 ft. below the highest outcrop. With the downward extension of the orebody to this point it would be conceded the unique distinction of being the world's premier mine.

It remained for R. K. Neill to realize the possibilities dimly disclosed by W. J. Rolfe after others had failed, and his great success is in a large measure due to his good mining judgment, and his policy of staying with the ore whenever possible. Such phenomenal results after little more than two years' operations have been rarely, if ever, achieved before, even in mining, certainly in no other business.

The vein in which this orebody occurs is a true fissure. Its strike is N. 80° E., its dip steep and southerly. The vein-filling is largely quartz-porphry, often changed completely to quartz. The metallic minerals which can be seen are argentite, stephanite, native and ruby silver, and iron pyrite carrying high gold-values, and there is reason to believe some of the tellurides are present in places.

Some wonderful specimens of native and brittle silver and some silver glance and ruby are obtained from a small persistent stringer in the big ore-shoot, which varies from 1 to 10 inches in width. The values of the whole orebody are fairly well divided between gold and silver, although the latter predominates. The dump at No. 1 has a value well over \$200,000, practically every ton having been taken out in straight development. The mine is situated on a rather steep hillside ensuring the most economical mining. There is an abundance of timber for all purposes; also ample water for power, milling, etc., is right at hand. Associated with R. K. Neill of Spokane in this unusually successful venture were R. W. Wood and A. B. Trites of Fernie, B. C., and they are now, with W. R. Wilson of Fernie, the fortunate owners of this ideal mine.

The successful development of the Premier naturally caused renewed activity and interest, which resulted in the discovery of several new orebodies of the same character in different parts of the mineral belt. These showings have all the ear-marks of mines to a superlative degree so far as the surface is concerned. In some cases the surface exposures are bigger than those of the Premier with the values fully as good.

Placer Mining in Sonora

A few placer mines are now being worked by Mexicans in the Altar district, west of the stations of Magdalena and Santa Ana. There is scarcely any water in the district, and the miner is necessarily dependent upon dry-washing processes. If the many physical difficulties could be overcome, it is believed that satisfactory returns on a larger scale could be obtained, although transportation facilities are deficient and costly. The most economical methods of transportation probably would be by mule or burro. It would be necessary to carry drinking water and supplies for long distances, and a gasoline engine and a dry-washer would be needed. Owing to the increased wage scale, dry-washing is much more expensive than formerly; it is estimated that \$1000 to \$1500 would be necessary to begin operations even on a small scale. This region is relatively safe from Yaquis. East of Hermosillo and Guaymas the mining districts are at present infested with roving bands of Yaquis. It is the judgment of experienced mining men that nowhere in Sonora could placer mining be carried on satisfactorily or profitably by foreigners at the present time. The Altar district is the only part of Sonora where such mining is proceeding and all the work there is being done by Mexicans.

According to one authority the best place for placer mining is near Suaqui, north-east of Hermosillo. The gravel there averages about 18 cents per yard, and can only be worked with dredges. There is plenty of water in this district. The Llano-Colorado district also holds forth some possibilities in placer mining, although, owing to the flatness of the surface, it is difficult to establish sluices. Some years ago an American company built a water reservoir there at a cost of about \$500,000, but, owing to the lack of drainage, the sluices could not be worked successfully. This district is reported to be rich in gold.

A placer mine is denounced in the same manner as any other mine. The denouncement must be made before the Agente de Minería at Hermosillo. The expenses are about ₧50, exclusive of the engineer's or surveyor's fees. A deposit of ₧5 must be made for each 'pertenencia' of 2½ acres before the denouncement can be completed.

THE Hot Springs district, in Alaska, has produced more than \$6,000,000 in placer gold, as well as some silver and tin. Theodore Chapin, in Bulletin 692-F of the U. S. G. S., describes the occurrence of tin in the district, and gives an account of mining there in 1917.

The Detection of Salting

By MORTON WEBBER

The opportunity for salting largely depends on the location and size of the mine under examination. From experience in valuing mines in various parts of the world, I do not believe in a 'preventive' for salting. Like other forms of dishonesty the experience and intelligence of those attempting fraud is important in salting a mine successfully. A competent engineer should be able to prevent the work of novices if salting is attempted during his examination; but if the mine is large, it is almost impossible to prevent salting that is carefully devised. Prevention is further handicapped by the frequent condition of an examining engineer being forced to employ local talent for the manual part of the examination. He may have to pit his wits against the calculated plans of a trained engineer—a sort of fallen angel. As there are many methods of salting, any of which may be chosen or perhaps some ingenious combination of them, the odds are with the salters. They have the opportunity of secretly choosing their plan of attack. The young and meticulous engineer who is sent to examine a prospect may doubt this. When inspecting a prospect few samples are cut. They are cut by the engineer himself or directly under his supervision. Probably he seals the samples himself and they do not leave his sight until they are assayed.

During the examination of a large mine this personal attention is impracticable. It is not possible, because time is vital in the majority of mine examinations; especially under an option to purchase. The period allowed for examination in the case of a large mine under option is seldom in proportion to the work to be done. On small properties thirty or sixty days are commonly allowed for an examination; but on large mines involving the inspection of extensive workings, the mine sampling and investigation of title have to be completed in sixty to ninety days. It is in the latter case that the reporting engineer courts fraud. The only feasible means of sampling is to divide the work among sampling crews. As stated, such crews generally have to be augmented, to an important extent, by local talent.

The examination of the prospect seldom contemplates an important initial payment. Prospects are usually sold on a development basis. The incentive for salting, therefore, is usually absent. Large mines are invariably sold on a basis involving an important initial payment maturing immediately after examination. A dangerous relation is therefore evident: the opportunity of salting varies directly as the importance of the examination.

Recently I examined a mine containing about 15 miles of underground workings. This case is cited as representative of a large examination governed by present-

day conditions. The terms of the deal can not be quoted in detail; it may, however, be stated that \$300,000 had to be paid immediately after examination. If the vendee did not proceed further in the transaction, and make a payment involving a total of \$1,000,000, the initial \$300,000 was to be forfeited, together with subsequent payments, as liquidated damages.

During the tenancy of the option I had, in addition to the examination of the mine, to arrange for some important metallurgical investigations. This entailed making up a large composite sample of the ore. The sample had to be representative not only as to metal content, but also in its gangue constituents. A glass model was made of the extensive workings. This required 16 large panes of glass. In addition, 26 important mine maps had to be compiled. These details are given for the purpose of showing that it was impossible for me, as the examining engineer, to devote the time necessary to superintend personally the cutting of samples.

About 15 tons of face-samples were cut. This demanded several crews in order to complete the sampling in the required time. Pneumatic channelers were used on the basis of one channeler to a crew. I took with me an assistant, who was a trained engineer, and some trustworthy intelligent miners who had previously worked for me. Local men were assembled in crews; each crew working under one of my men. After the sampling-widths had been personally painted and tagged by me, the samples were cut and sacked by the crews. While each sample was, therefore, cut and sealed under the supervision of one of my men, the method lowered the quality of the personal attention necessary to prevent salting. One of the members of each crew might have had 'salt' in his tobacco, which would have gravitated with the ash from his pipe into the sample. Some may have had a weakness for long finger-nails, which picked up 'salt' when the hand was put in a pocket. Salt in chewing-tobacco may also have been available. As there are several other expedients of ingenious knavery, it would be courting a first-class fraud to depend on my own man in charge of each crew to prevent salting. To know that your own men are honest is not enough; there is too much at stake. To employ a Sherlock Holmes and a crew boss combined at \$10 per day is not feasible.

To ensure safety I believe that protection must be sought by arranging for the 'detection' of salting and not its 'prevention'. It is, however, advisable to continue to seal samples immediately they have been cut. The practice is orderly and impresses the sampling crews with the importance of the work; but an engineer making

an examination involving a large sum of money should drop the idea that sealing samples ensures protection. If 'salt' is going to be introduced after or during cutting, but prior to the opening of the sacks for the crushing and reduction of the samples, it will be done by some of the methods heretofore mentioned. If it is desired to salt the sample after sealing, this can be done by a syringe and not by clumsy meddling with the seal. If, moreover, the crew boss is given a seal and uses it immediately on sacking, the psychology is productive. It conveys the impression that you are relying on his honesty and thoroughness, and thereby his best may be brought out.

The following plan, I believe, will disclose salting, before submitting the report, no matter how ingenious the scheme, for all methods of salting depend on introducing the fraud at one or more of the following stages:

(1) Preparation of the mine faces before the arrival of the examining engineer.

(2) Introducing salt into the sample during the cutting of the sample.

(3) Injecting salt in the form of solution into the sample-sacks.

(4) Secretly dropping salt in the sample during crushing, mixing, or reduction to pulps.

(5) Rubbing salt on the bucking-board and crusher-jaws after the examining force has gone to bed. This method is only applicable in gold and silver examinations, the limitation being due to the small proportion of salt that can be retained on the surfaces.

(6) Introducing salt into the flux. This refers to examinations where assaying is done at the mine.

(7) Fraudulent assays, submitted by the assayer. This refers to examinations where pulps are sent to a custom assayer.

Many engineers employ some of the methods of protection hereinafter set forth. The prime value of protection herewith suggested depends on a combination of former practice with a 'key series' to be described. Nearly all the old methods of detection fail to afford sufficient security. For example: many engineers employ a 'dummy'. Crushed samples of rock containing no ore are secretly conveyed to the workings by the examining force. The intention is to allow the dummy to pass into circulation with the other samples. If the samples are being salted the dummy will get salted and expose the scheme. Like the sealing of the sample-sacks, the introduction of a dummy does not ensure absolute protection. In the preparation of faces prior to the arrival of the examining engineer (No. 1) the successful drifting through of the dummy without being salted would give the examining engineer a fictitious feeling of security totally unwarranted. It would also fail to expose salting during the cutting of the samples as described.

The dummy, however, is used by me as part of my combination means of protection because it will detect salting if attempted by methods No. 3, 4, 5, and 6. It would be of no value in exposing methods No. 1 and 2, and it is doubtful if it would expose No. 7, because a dishonest assayer would probably not tamper with an

assay that showed a 'blank'. The dummy, however, is an infallible means of detecting salting done by method No. 5.

My key series is as follows: Before commencing sampling I first endeavor to acquire a thorough grasp of the mine under examination. This is necessary to sample the mine intelligently. Then I proceed personally to whitewash the strips to be sampled. This part of the examination is always done by myself. The subsequent cutting of the samples and their reduction to duplicate pulps is mechanical, requiring only well-trained subordinates.*

After the sampling is completed, I re-sample a series. From 10 to perhaps 30 channels are re-cut, depending on the scale of the examination. The re-channeling of several cuts is not an uncommon practice with engineers; but I depend on the improvement of a key series. For example, after the sampling is completed or nearly so, but prior to the platting of the samples, I go through the workings and remove the tags of a number of cuts, substituting new numbers. I then give a note of the new numbers to an assistant and have them re-cut. The key giving the duplicate numbers, each to each, is not allowed to leave my possession. It is in keeping this information strictly to myself that I depend on detecting salting. In my judgment this is an effective method, because its simplicity does not require me to take even my chief assistant into my confidence. The penalty for being salted on an examination involving a large sum of money is so great that the engineer is entitled to take this precaution. Not only will this key series detect salting, but it will also disclose the efficiency of the sampling. It will expose faulty channeling, incompetent mixing and cutting down, or inaccurate assaying.

It is necessary to point out that the common practice of tagging sample-cuts in consecutive order should be discontinued. A drift, for example, should not be tagged 358, 359, 360, 361, and so on. If, when using the key series, the examining engineer desires to re-sample 359 as being one of the re-cuts for the series, and removes tag 359, substituting number 635, but leaves undisturbed 358 and 360 on either side of the original tag removed, the presumption is that 635 was originally 359. The protection of the key is lost. Also there is no evident gain in tagging samples consecutively. All that is necessary is for each cut to be tagged by a number so that its position can be platted by the surveyor. In my practice the surveyor follows the sampling crews. His duty is to plat the samples and check the width sampled.

It may be argued that a careful salter would take care to inject a uniform quantity of salt, so that the re-cut sample would contain the same proportion of salt as the original. It was the recognition of this danger that made me devise the key series. Safety lies in the fact that it is almost impossible to go over a channel a second

*While the cutting and treatment of the samples are mechanical, the decision as to their position and width should fall squarely on the shoulders of the examining engineer. It is in this phase of the work that he is called upon to show his ability as a valuer of mines.

time and cut the same weight of sample. If a sampling crew removes, say, a 50-lb. sample from a 5-ft. cut, on going over the same channel a second time a great difference will be found in the weight of the second sample. It will be either considerably more or considerably less; yet the second sample can be equally representative. To salt successfully a key series it would, therefore, be necessary to know the weight of the original sample and put a proportional quantity of salt into the original and the duplicate, depending on weight. By tagging the sample-cuts indiscriminately and retaining the vital key on the person of the examining engineer, it is impossible for the salter to obtain this information.

The object of using a series instead of comparing each re-cut separately with the original is that it frequently happens that a re-cut will not sufficiently correspond in assay with the original sample. This is common in mines where the metal value is in the form of friable sulphides. In such cases the re-cuts will seldom correspond, each to each, but in comparing the average of a series of ten to fifteen re-cuts the law of average is brought to bear. I have frequently instituted a series where there were discrepancies of several dollars between every original and re-cut, but the average of the series checked to a few cents.

Some other features in the application of the key series may be considered. The key series is never employed in unimportant workings where there would be little object in salting. Also the series is never confined to one portion of a mine. In a large examination I use three or more series. Preference is always given to vital parts, as for example, the lowest level, important cross-cuts through supposed ore, and points approaching the face of development drifts. Generally speaking, the place to suspect salting is in workings vital to the consideration of the future life of the mine. One of the most desirable mines to salt is a gold or silver mine with some actual ore developed, which can stand sampling without assistance, and where one or more winzes and the horizontal extremities of the lowest level are supposed to be in high-grade ore. Assuming that the mine had not been salted, a large initial payment would be justifiable.

An attempt was made to foist such a property on one of my clients. The key series, however, disclosed the fraud. While the standing ore in the mine assayed as claimed, a winze from the lowest level and also the horizontal extremities of the lowest level had run out of ore. This combined evidence indicated the superficial nature of the deposit. The owner had endeavored to convert these openings into exposures of high-grade ore. He inferred correctly, that if his scheme succeeded, he would swing the valuing evidence just as far in favor of the mine as the truth was against it. It transpired subsequently that the owner had injected filings from the gold and silver coinage of the U. S. A. into the cracks and crevices of these vital extremities by means of a shot-gun.

The use of the shot-gun is difficult to detect, except by the key series, for sampling additional faces would only

mean additional salting. All the usual methods employed to protect against methods No. 2 and 7 inclusive, would be nugatory, because the sample is salted at the fountain-head. This method will shoot salt into the cracks and crevices. In the actual case cited, both the re-cut and the original were salted. The key series, however, exposed the fraud by indicating a wide discrepancy between the average of originals and re-cuts.

The reason for stating that the class of precious-metal mine, above mentioned, is particularly adapted to salting is as follows: The use of the shot-gun is probably the method of salting most difficult to detect. To salt a mine by this method is, however, most expensive, and herein is the value of having an ore-reserve that will stand sampling unaided. The salters can confine the expense to salting the winzes and other extremities vital in the consideration of the future life of the mine. Some years ago I sampled a gold mine in California. The mine had a fair amount of profitable ore in sight. The ore-shoot, which was in a vein dipping about 45°, had a definite rake to the south. The lowest level, as represented by the vendor's assay-maps, seemed decidedly the best level of the mine. It also indicated the coming in of an additional shoot evidently on a horizon lower than the original shoot. A winze had been sunk in the new shoot, which showed ore of higher grade than the supposed average of the mine. All these facts substantiated the statements of the vendor that the future of the mine was of excellent promise. This, in addition to the standing ore, which actually existed, seemed to justify the large initial payment required in the terms of the option. A few dummies sent down every third day always assayed blank. It was equally evident that the local assaying was reliable. The key series showed that the ore above the lowest level actually existed. It, however, showed that the lowest level 'bottomed' the mine, that the new shoot was a myth, and that the only merit the enterprise possessed was as a gutting proposition.

In respect to protection against method No. 6, my practice may be of interest: In precious-metal examinations, when assaying is done at the property, flux and slag assays are made daily. At frequent intervals I transfer several pulps of samples that have been assayed to new envelopes and instruct the assayer to have them run. The key giving the old and new numbers is retained by myself. This checking of the assayer is virtually a modification of the key series. In the last examination made by me, where assaying was done at the mine, my practice was as follows: An assayer and two helpers turned out about 50 assays per day. The crushing, mixing, and reduction to duplicate pulps was done in another building. This department was under an assistant. The duplicate pulps, as obtained, were packed in boxes by this department. Only the original pulps went to the assay-office, in another building. The original pulps after assay were filed at the assay-office. On alternate days I went to the assay-office, changed ten previously assayed pulps to new envelopes for re-assay, using a key series. In this way the work of the

assayer was always under scrutiny. Apart from his honesty, it proved that his work was reliable.

For protection against method No. 7, much the same system is used as against method No. 6. Instead, however, of having the custom assayer re-assay a number of originals, a series of duplicates, masquerading under different numbers, is forwarded for assay.

The checking of the assaying, if done at the mine or by a custom assayer, is not necessary to detect salting if the key series is used underground. The reason I institute this additional checking is to know, apart from fraud, that all departments are performing reliable work. This must be known while the work is proceeding. The dummy, however, is always used, as it quickly detects salting by methods No. 3, 4, 5, and 6. In such cases the expense of further examination may be saved.

Summarizing the foregoing practice, I rely on a key series for underground work, a modification of the key series for checking the assaying, and the use of the dummy. The checking of the assayer and the use of the dummy are not essential to detect salting, as stated, if the underground key series is properly employed. I maintain that the underground series unaided will detect salting, no matter how ingenious the attempt may be. With the key series even originals and duplicates can be salted and the fraud will be exposed because of the discrepancy in the averages. As stated, this is owing to the impossibility of re-cutting an original channel to obtain a duplicate so as to have both samples of the same weight. To salt successfully a key series, the salt would have to be introduced on a proportional basis; to do this, the relative weights of all originals and all re-cuts would require to be known. The proper use of the key series will fill a want infinitely more constant than merely protecting the mine-valuer from knavery. Formerly when conducting large examinations, there was always a thought in my mind that something might have gone wrong. The delegation of detail work to others injected this feeling of insecurity. With the proper application of the key series underground and its additional use to control the crushing and assaying departments, the engineer will know when the examination is completed that his sampling will stand the closest inspection.

The Upton-Thornton Oil District of Eastern Wyoming

The Upton-Thornton oil district lies on the western flank of the Black Hills, in eastern Wyoming, in Weston and Crook counties. The oil field itself is about 3 miles north-west of the town of Thornton, on the Chicago, Burlington & Quincy railroad. It is about 20 miles south-east of the Moorcroft oil field, 90 miles north-east of the Salt Creek oil field, and about 80 miles due north of the Lance Creek oil field. An area of about 60 square miles, which includes the territory where the producing oil wells have been drilled and the adjacent country, has recently been examined by E. T. Hancock, of the

U. S. Geological Survey, who has submitted a report on it for publication. The report is accompanied by a map showing the boundaries of the geologic formations, with contours showing the geologic structure, and cross sections showing the relations of the different formations to one another and to sea level.

There were 16 producing wells in the field when the examination was made, and 13 of these belonged to the Southwest Oil Co., which controls a large part of the field. The oil comes from a single steeply dipping sand, which is reached at depths ranging from 448 to 843 ft. The yield per well is low, averaging between 5 and 10 barrels a day. The oil is of excellent quality and has a specific gravity ranging from 0.820 to 0.826 at 15° C. It is taken by a small refinery belonging to the Southwest Oil Co., which supplies local trade with gasoline and other products. The oil field is not on an anticlinal fold but appears to be on a structural terrace, where the rocks dip much less steeply than they do in the surrounding area. An outcrop of the steeply dipping oil-bearing sand is only half a mile from the nearest well and a mile and a half from the most remote, a fact that not only permits a close study of the character of the sand but that helps to show the fallacy of the contention of some geologists that wherever an oil-bearing sand is exposed so much of its oil will escape as to preclude accumulation in commercial quantities near by. The extent to which the oil escapes, or its escape at all, probably depends on a change in the dip of the bed in which it is contained or on variations in the texture of the rock that forms that bed, as well as on the level of the ground water and other conditions, all of which are subject to considerable variation.

Within the Upton-Thornton district, but outside the proved field, there are two domelike anticlines which appear structurally suited to bring about accumulations of oil. One of these is called the Thornton dome; the other, the Upton dome. The oil-bearing sands in the lower part of the Graneros formation, which is commonly oil-bearing in this region, have been eroded from the higher parts of the Thornton dome, but they may yield oil in wells drilled far down the flank of the dome. However, it is possible that the deeper Minnelusa sand, of Carboniferous age, which is reported to contain oil in the Old Woman anticline, 75 miles to the south, may be present in this region, and wells should be drilled deep enough to test it before the dome is condemned as barren of oil. This dome has been drilled at two points, and the appearance of the sludge piles at the abandoned wells indicates that the drill entered the Triassic red beds.

The Upton dome is probably a less promising source of oil and gas than the Thornton dome, for it is much less pronounced, having a closure of but 50 ft., as against a closure of 500 ft. on the Thornton dome. In the Upton dome the sandstone in the lower part of the Graneros formation lies beneath about 150 ft. of Mowry shale, but it is thin and is not covered with a cap-rock sufficiently impervious to hold the oil.

Mine Accidents: English Speaking v. Non-English Speaking Employees

By ALBERT H. FAY

*The employment of non-English speaking labor in American mines has been brought about by reason of the rapid expansion of the mining industry, beginning in the early 'eighties. The Americanization of this great body of labor, and its relation to accidents in the mining industry, are two problems of prime importance—the first as affecting citizenship and the growth of this Republic, and the second as an economic problem in mining costs. The former exerts an influence upon the latter, for the former implies education, social welfare, civic pride, and a general uplift to the ideals that America stands for. Ignorance, dirty and filthy living conditions, ill-health, disregard for law and order, discontent and lack of civic interest, lead to indifference and carelessness, perhaps the greatest of all accident causes. Eliminate carelessness and at least 50% of the accidents will disappear from industries.

IMMIGRATION TO AMERICAN MINES

During the decade previous to the year 1880 (as well as in earlier years), the greater part of the employees in the coal and metal mines were Americans or representatives of the English, Scotch, Welsh, German, and Irish peoples. The majority of the men of foreign birth had been in this country for some years previous to the great expansion of the mining industry which began at about this time. English-speaking miners continued to immigrate and to find employment in the mines in large numbers until about 1890. Since that year comparatively few immigrants from Germany and Great Britain have entered this industry, although Swedes and other Scandinavians have been constantly employed since the early 'eighties.

The employment, in the mining industry, of immigrants from southern and eastern Europe began about 1880. The Slovaks were the first arrivals and immigrated in considerable numbers. They were followed within a year or two by a few Magyars, and the number of immigrants of this race gradually increased each year. The Polish immigration began about 1890, although individual members of this people had been coming for a period of nine or ten years. After the year 1890 Poles and Slovaks arrived in great numbers. A few Italians were employed before the year 1895, but the immigration of this race did not begin upon a large scale until about 1900. They were at first engaged in railroad construction and maintenance-of-way work and gradu-

ally drifted into the mines. Croatians were employed in some districts before 1890, and Servians began to arrive in small numbers in the early 'nineties. The great bulk of all the immigration from southern and eastern Europe, however, has occurred within the last 18 years. Russians, Bulgarians, Rumanians, Ruthenians, Syrians, Armenians, Macedonians, Croatians, Servians, as well as Poles, Magyars, Slovaks, and Italians, have been among the recent arrivals. The races of southern and eastern Europe continued to come up to the time of the War, to find employment in the mines in increasing numbers in almost every important mining district in the Eastern states, and in the Lake district. Many of these recent immigrants have found their way to the Central and Western states. As a result of the rapid expansion of the mining industry, many mining communities have been founded, the population of which is largely made up of immigrants who have arrived during the last ten years.

The pioneer American, English, Irish, German, Scotch, and Welsh miners are thus outnumbered and their positions filled by the more recent arrivals. It is not difficult to account for this change, which is still going on. The former operatives and their descendants had opportunities to secure more congenial and safer work in other industries. Many of them advanced in the industrial scale, becoming foremen and attaining other responsible positions. Many also migrated to the Middle-West and Western states. Many of the former miners who left the industry entirely because of change in mining methods or the employment of immigrants entered mercantile, clerical, mechanical, or pleasant work of other kinds. Many of the business and professional men in the mining towns were formerly mine-workers. Their places were filled without difficulty with recent immigrants who were content with the wages and working conditions that prevailed at the mines. The wages paid in American mines seem very attractive to the recent arrivals of agricultural laborers from southern Europe.

FAILURE OF NATIVE-BORN TO ENTER THE INDUSTRY.

This racial displacement has occurred not only through the departure from the industry of the former employees, but also through the refusal of their children to enter the industry and the attitude of the parents themselves, who frequently discourage it. Of the total native-born, of fathers who were miners, a large percentage enter occupations other than mining. The conclusion from the limited data at hand, therefore, seems to be that while the foreign-born males of more than 16 years of age,

*An address delivered before the eighth Annual Safety Congress. Mr. Fay is mining engineer in charge of Accident Statistics for the U. S. Bureau of Mines.

whenever employed, work in the mines, the persons native-born of native fathers, together with the second-generation immigrants, are loath to enter the mines. This inference bears out in a large measure the experience of the mine operators, who state that the native-born and the second-generation immigrants are not entering the mines in the same numbers as formerly and that the industry is receiving a constantly decreasing number of employees of these classes.

There exists a prejudice against recent immigrants, which also operates to an important extent in the displacement of former employees. Many Americans, English, Germans, Scotch, Irish, and Welsh did not and do not desire to be associated in the mines with the recent immigrants, and the feeling has become prevalent that a sort of reproach attaches to an intimate working relation with the foreigner. The races of former immigration have, therefore, gradually left the industry and have entered other work, which, they feel, is more dignified and congenial.

The relatively small number of American miners who remain in the industry must work side by side with the recent immigrants. To a greater or less degree the standard of safety in the mine is set by the demands of the ignorant and inexperienced immigrant, not by the more intelligent American, and the standard of life is decided to a large extent by those conditions which will be accepted by the same recent immigrant. In short, in order to work in the coal-mining industry, the American must compete with the recent immigrant, who, as a rule, is not very particular as to the living and working conditions. These conditions, however, are in most cases far better than in factory towns, where congestion prevails.

Another effect of recent immigration from central and southern Europe has been the preventing of the English, Irish, Scotch, and German immigrant entering the mining industry. As already noted, these Western European races were coming to the industry in large numbers prior to the early 'eighties, but the number began to decline toward the end of the decade and practically stopped about 1893 or 1894. There can be no question but that the immigration of the Slovaks, Poles, Magyars, and other races operated to prevent the further coming of these older immigrants to the industry, precisely as it operated to drive out of the industry those already employed together with the native Americans. There is, therefore, no incentive for the English or German miner to migrate to the mining regions and compete with the Slovaks, Croatians, and Italians.

CITIZENSHIP

A point of general interest is the tendency on the part of different races of foreign birth to acquire citizenship, and their general interest in public and civic affairs. The recent immigrant manifests little real or intelligent civic interest. This may be ascribed to his ignorance of our political methods, his inability to read or speak English, the social and political aloofness of these races in the more or less remote mining villages, and their

desire to avoid taxation. Those who reside in or near the cities seem to exhibit more interest than do those of the isolated communities. It seems that the Bohemians and Moravians, 94% of whom can read some language, take a much more active part in civic affairs than any other race of recent immigration in the bituminous districts of Pennsylvania. Among the other Slavic races, the Slovaks (82% read) and Poles (77% read) lead in this regard, while the Croatians (67% read) make the poorest showing. It is the general experience that this last race shows but little civic interest and that very few become naturalized. The Italians (81% read) are more active than the Slavic races in their efforts to become citizens, and appear to take a more active part in civic affairs. In cases where there seems to be encouraging civic activity it is nearly always due, not to their own intelligent efforts to attain citizenship and exercise its privileges, but to the influence of interested politicians, who in many cases may be a leader of their race; for example, an intelligent banker and steamship-ticket agent. It seems true of all the later immigrating races that they take far less interest in civic affairs than did the German (97% read) and English (98.5% read) immigrants.

The foreigner should be taught that the laws of America were made to protect, and not harass, every good citizen, rich and poor alike, and it is the duty of well-informed Americans to make this understood. If well-meaning foreigners, the making of good citizens, are left entirely to their own devices, they fall an easy prey to the designing I. W. W. and the Bolsheviks. Somebody who understands their language fully, and in whom they have confidence, should explain to them that they are being deceived so long as they listen to anti-American propaganda.

CHURCH AND THE IMMIGRANT

The church association between the native Americans and the southern and eastern European immigrants is limited. The general attitude of the native churches toward the immigrant is one of indifference and there is a strong inclination in many communities to shun association with the immigrant in church activities. In many cases where missionary efforts are made by native churches of any denomination, services for the immigrants are usually held in barns, stores, or other unattractive places, thereby lessening the interest in them. The races from the southern European countries, which compose a large portion of the mining population, have been reared where there is no social caste in religious organizations, and have worshipped in buildings which are unsurpassed in beauty and grandeur the world over. When these people are offered services held in stores, barns, and similar buildings, their interest in the service naturally is less and they become indifferent. Lack of interest in church affairs tends to decrease activities in civic affairs. The church and its allied organizations can be an important agent in teaching these immigrants the rudiments of the English language and pointing out to them their duties as American citizens.

LACK OF MINING EXPERIENCE

Men of the races of the old immigration (Western Europe) have been employed in the mines of the United States for many years. As a result of their experience, both in this country and abroad, they are far better qualified as miners than are the southern and south-eastern Europeans. The older immigrants speak English either as their native tongue, or, as in the case of the Germans and Scandinavians, because of long residence in this country. They may be treated in almost every respect upon the same basis as the American miners.

The employees of the races of the recent immigration, on the other hand, have been in the United States for so short a period of time that even though it be assumed that they have been employed in mining ever since their arrival, they must have had but a brief experience at most in the mines of this country. The data further show that very few of their number had mining experience abroad. Over 80% of the Scotch and English miners had mining experience in their native country before entering the American mines, while for the south Italian and Croatian less than 5% have had mining experience. Most of the latter were farm laborers in their native countries. Upon coming to the United States they decided to follow the occupation of mining because the work was better paid than any other obtainable, although many of them had been here only a few months and many more but a year or two. Under these circumstances it is not surprising that they know little or nothing of rock-formations, of fire-damp, of the properties of coal-dust, and of the handling of explosives—matters about which every coal miner should be thoroughly informed. To determine whether a piece of slate or roof is or is not likely to fall, often requires a considerable degree of experience, and the majority of the Slavs, Magyars, and Italians have not this experience.

IMMIGRATION IN RELATION TO MINING ACCIDENTS

The mines are presumably less safe than they would be with native American, English, Irish, Scotch, Welsh, or German labor, because recent immigrants often accept more dangerous working conditions than the first-named employees. Furthermore, the later immigrants are ignorant and untrained, and are a source of danger to themselves and to the other workmen. Among the older mine workers the feeling is strong that the employment of non-English speaking races has complicated the problem of safety in the mines. They assert that carelessness on the part of recent immigrants, and the ignorance of those who are suspected of having obtained their places without having had the required experience as miners, have tended to render the mines less safe and thus increase accidents.

A large proportion of the deaths and injuries reported for the coal mines of the United States occur among the non-English speaking miners. The employees consisting of the races of southern and eastern Europe, having had little experience in mining either in this country or abroad, are particularly liable to accidents, and as the re-

sponsibility for accidents rests in many cases with the men injured, to say that they are particularly liable to accidents is in effect to say that they are responsible for a considerable proportion of all the accidents occurring in the mines.

The mine accidents for which the workmen are themselves responsible fall naturally into two classes, those due to carelessness and those due to ignorance. As regards the first of these it is probable that the foreigner is no greater offender than the person of native birth. Many of the Americans and other English-speaking miners are undoubtedly reckless, and a large proportion of all the accidents occurring among their number seem to be due to this cause. Grave risks are often incurred for the sake of avoiding a little extra labor. Props are left unplaced, open lamps are used instead of closed lamps, cars are driven in a careless manner, explosives are handled recklessly—all in defiance of the most elementary rules prepared by men of long experience in the industry. Among the recent immigrants, on the other hand, many of the accidents are unquestionably due to ignorance, for by reason of their lack of experience, they do not see nor realize the dangers that confront them; nor do they readily comprehend the necessary precautions that must be taken to make their working places safe.

Lack of experience in the mines has a marked effect upon the high accident-rate as indicated by a study of accidents among the immigrants whose experience in mines, before coming to this country, was known. The fatal, serious, and non-fatal injury rates in the coal mines of Pennsylvania and West Virginia are approximately 14.5 per 1000, for those of whom 10% had mining experience prior to coming to the United States. The accident rate for those of whom 10-20% had mining experience is about 12 per 1000, showing a rapid decrease as mining experience increases. It would seem from this while experience is limited, these immigrants soon gain sufficient knowledge to use a certain amount of caution, thus giving a decline in accident rate.

As contrasted with the decrease in accident-rates among those of whom 5 to 30% have had mining experience, the accident rate based on similar data for those of whom 50 to 60% have had mining experience prior to coming to this country is 10.5, whereas the rate is 12 for those of whom 80 to 90% have had experience in the mines, a marked increase with the extra experience. This is largely due to the tendency of those with considerable experience to become more or less careless or reckless and to think that they can slight certain features of work without an accident. A new man entering the mine would not consider for a moment crimping a cap with his teeth, whereas many of the men who have been in the mines for 8 to 10 years would not hesitate and do not hesitate to crimp caps with their teeth. Other instances of carelessness might be cited. The available data, therefore, seem to indicate that inexperience is responsible for many accidents and that a little experience begets much caution on the part of the recent or new employee. As indicated above, there is thus a tendency toward a rapid reduction in accident

rates to a point where between 30 to 40% of the employees have had mining experience. Beyond this percentage, caution wanes and is replaced by carelessness with a resultant increase. The green miner may be over-cautious, but he lacks experience. The seasoned miner has the experience, but too often caution is replaced by carelessness. Caution combined with experience will go far toward accident reduction.

Another element of danger is contributed by the fact that few of the recent immigrants speak or understand English, while almost none are able to read or write the English language, and placards of warning do not reach them. It is probable that the instructions of the mine bosses and inspectors are, because of this fact, frequently misunderstood. An inspector, for example, tells an immigrant miner, in English, of course, that his roof needs propping. The miner seems to understand, but does not, and a fall results. In some mines printed signs are used to indicate the presence of gas or other peril. These signs are quite unintelligible to most of the foreigners. A common language is absolutely necessary in every safety-first campaign. Accident rates are much lower in England, France, Belgium, Germany, Austria, and Japan than in the United States. In these countries but few foreigners are employed, a common language being used in each country. The difference in fatality rates cannot be entirely attributed to the lack of mixed languages, but certainly a large percentage of the accident reduction may be attributed to the 'common language' mines.

A comparison of accident rates with the ability of the miner to read some language or to speak the English language, shows that the ability to read, although it may not be English, has a greater influence on accident reduction than the ability to speak English. This may be accounted for by the fact that ability to read develops a higher degree of intelligence and places the employee in a better position to realize dangers more readily than one who cannot read. Furthermore, if he is able to read, he is more likely to heed danger signs put up in certain places.

The recent immigrant because of his lack of experience, his inability to speak English, and his keenness for earning money is often willing to work in places where more experienced or more intelligent men would refuse to work. For the same reasons he will frequently be satisfied with and accept mine equipment too defective for safety.

OCCUPATION OF ENGLISH SPEAKING AND NON-ENGLISH SPEAKING RACES

Comparative figures by occupations, based on the payroll of 10 typical coal mining companies in Pennsylvania, show that about 33% of the English-speaking employees are employed as pick miners as compared with about 52% for the south-eastern Europeans. As a matter of fact, from trackman to loader, the English-speaking employees represent about 61% of the total, as compared with 82% for the south-eastern Europeans. These figures, therefore, indicate that the non-English

speaking foreigner is employed in the most hazardous of the mine occupations, hence one reason for the higher accident rate.

ACCIDENTS BY NATIONALITY
